Density functional calculations of forces and total energies have been performed for the ground states of H_2O, NH_3, and CO_2 using the localized muffin-tin orbital (MOT) basis of Harris and Painter (1980). Exchange-correlation effects are described using the local density (LD) approximation. It is shown that: (i) the localized MOT basis yields results of useful accuracy with a small number of functions; (ii) the LD approximation gives a remarkably accurate equilibrium geometry in each case; and (iii) details of the electronic structure, such as the inversion barrier in NH_3, are reproduced with reasonable accuracy. The bonding in all three molecules is discussed in terms of the geometry dependence of the one-electron eigenvalues (Walsh diagrams). (38 refs.)

100496 Maximum-entropy inference and momentum density approach. T.Koga, M.Morita (Dept. of Appl. Chem., Muroran Inst. of Technol., Hokkaido, Japan).
J. Chem. Phys. (USA), vol.79, no.4, p.1933-8 (15 Aug. 1983).
Previously, the authors have proposed a rigorous method to obtain the total energy E of a system of interacting atoms based on the electron momentum density and its redistribution during the interaction process. In the paper, they consider an inverse problem of constructing the momentum density distribution from the knowledge of the total energy E. Using the method of the maximum-entropy inference in information theory, analytical expressions are derived for the radial momentum density as a function of E. The results are applied to the interactions in the H_2 system and the reliability of the inference is examined. In spite of its simplicity, the inferential momentum distribution is shown to be reliable semiquantitatively. (17 refs.)

100497 Intramolecular unsymmetrical OHO bonds. Thermochemistry [NMR in acetylacetones]. K.I.Lazaar, S.H.Bauer (Dept. of Chem., Cornell Univ., Ithaca, NY, USA).
J. Phys. Chem. (USA), vol.87, no.13, p.2411-16 (23 June 1983).
Most O...H-O bonds are unsymmetrical; the authors' report deals with nearly symmetric potential wells, slightly perturbed by the next to nearest neighbor environment. The ratios of residence times of the hydrogen atom in the two-well potentials in unsymmetrically substituted acetylacetones were derived from NMR chemical shifts at the carbonyl carbons (^{13}C natural abundance), recorded for dilute solutions of the enol isomers in nonpolar solvents. Cross-checks between several equilibrium constants indicate that the motion of the bridging hydrogen atom is strongly coupled to the dynamics of the molecular skeleton. (11 refs.)

100498 Determination of nonadiabatic potential curves from wavefunctions obtained by configuration interaction calculations. M.C.Bacchus-Montabonel, G.Chambaud, B.Levy (Lab. de Chimie, ENSJF, Montrouge, France).
J. Chim. Phys. & Phys.-Chim. Biol. (France), vol.80, no.5, p.425-39 (May 1983). In French.
Non-adiabatic potential-energy surfaces are evaluated from adiabatic ones. In the non-adiabatic representation, an effective hamiltonian $\underline{H}$ is defined on a small space $\bar{S}$—the reference space; the eigenfunctions of $\bar{H}$ are the projections of the open-channels obtained in the adiabatic calculations, the eigenvalues of $\bar{H}$ are the adiabatic ones. The choice of the basis describing the reference space has been investigated in the case of the $(ArH)^+$ system. The results are good for large distances (more than 4 a.u.). (14 refs.)

100499 Molecular interactions of some picolines with benzene and carbon tetrachloride. M.G.Botros, M.M.Naoum, H.G.Shinouda, H.A.Rizk (Dept. of Chem., Cairo Univ., Cairo, Egypt).
J. Chim. Phys. & Phys.-Chim. Biol. (France), vol.80, no.5, p.441-8 (May 1983).
Excess volumes, $V4^E$, of binary mixtures of α-picoline, β-picoline, and γ-picoline with benzene and carbon tetrachloride, and dipole moments, μ_2, of picolines in these mixtures have been measured as a function of a composition at 20° to 50°C. The V^E data are negative for all mixtures studied, and exhibit a minimum at a 1:1 molar ratio, suggesting that alternate molecules of the two components are probably involved in a packing pattern. The μ_2^2 data are greatest in the very dilute solutions and gradually decrease with increasing picoline concentration, indicating the applicability of Onsager's model over the entire concentration range of picolines. The results are discussed in terms of dipole association which seems to be stronger in carbon tetrachloride solutions than in benzene solutions. (34 refs.)

100500 The proton potential in short hydrogen bonds. D.Hadzi (Boris Kidric Inst. of Chem., Ljubljana, Yugoslavia).
J. Mol. Struct. (Netherlands), vol.100, p.393-402 (July 1983).
The state of knowledge of the proton potential in systems for which double minimum and symmetrical, single minimum type curves have been envisaged is critically reviewed. In particular, the proposed model potentials for carboxylic acids, for KDP type ferroelectrics and for the shortest hydrogen bonds are confronted with experimental data, particularly from vibrational spectra. The early attempts at explaining the complex features in the AH stretching region by level splitting in one-dimensional double minimum potentials have not been successful. The interest in the profile of the potential surface is shifted from this aspect to its role in anharmonic interaction based general band-shaping mechanisms. (54 refs.)

100501 A comparative study of lithium, sodium and hydrogen bonds formed by 1:1 interaction of electron donor molecules with lithium, sodium and hydrogen halides. G.V.Kulkarni, C.N.R.Rao (Solid State & Structural Chem. Unit, Indian Inst. of Sci., Bangalore, India).
J. Mol. Struct. (Netherlands), vol.100, p.531-7 (July 1983).
Dissociation energies of 1:1 complexes of hydrogen, lithium and sodium halides with water, methanol and ammonia vary in the order $LiX > NaX > HX$, the dissociation energy in the case of lithium bonds being of the order of 200 kJ mol^{-1}. The magnitude of charge transfer, Δq, between the donor and acceptor molecules is also highest in the case of lithium bonds. The dissociation energies and Δq have been related with various properties of the complexes. (7 refs.)

100502 Use of *l*-dependent pseudopotentials in the study of alkali-metal-atom-He systems. The adiabatic molecular potentials. J.Pascale (Service de Phys. des Atomes et des Surfaces, CENS, Gif-sur-Yvette, France).
Phys. Rev. A (USA), vol.28, no.2, p.632-44 (Aug. 1983).
Molecular-structure calculations have been performed to obtain the adiabatic potentials for ground state and numerous excited states of alkali-metal-He systems. They use l-dependent pseudopotentials defined from spectroscopy data or scattering data to describe the e^--M^+ and e^--He interactions (where M is any alkali-metal atom). Standard variational calculations are made, and a large basis set of Slater-type orbitals is used in order to ensure accuracy and stability of the results. The author's results are discussed along with comparisons with other theoretical and experimental data. The overall agreement which has been obtained with all available experimental data indicates that significant improvements in the calculation of the M-He adiabatic potentials have been achieved by using an l-dependent pseudopotential technique. (45 refs.)

100503 High-energy expansions for the phase shifts in screened Coulomb potentials. A.Bechler (Inst. of Theoretical Phys., Warsaw Univ., Warsaw, Poland), R.H.Pratt.
Phys. Rev. A (USA), vol.28, no.2, p.1190-2 (Aug. 1983).
A high-energy expansion is obtained for nonrelativistic phase shifts in a screened Coulomb potential, expressing their difference from the corresponding point Coulomb phase shifts as quadrature integrals over the potential. The result exhibits the role of small- and large-distance regions of the potential in determining these phase shifts. (9 refs.)

34.40 ELASTIC SCATTERING OF ATOMS AND MOLECULES

100504 Electron scattering from a potential in a radiation field. R.Shakeshaft (Phys. Dept., Univ. of Southern California, Los Angeles, CA, USA).
Phys. Rev. A (USA), vol.28, no.2, p.667-73 (Aug. 1983).
Electron scattering from a potential in the presence of a classical, monochromatic, spatially homogeneous radiation field is considered. A coupled integral equations method is formulated to calculate the cross section for stimulated photon emission or absorption. This method is applicable for field strengths such that the difference between the instantaneous velocity and the cycle-average velocity of the electron is not too large. The method has been applied to the case of a separable potential, and some results are presented. (7 refs.)

34.50 INELASTIC SCATTERING OF ATOMS AND MOLECULES

100505 Interaction potentials for Li^+-rare-gas systems. L.A.Viehland (Parks Coll., Saint Louis Univ., Cahokia, IL, USA).
Chem. Phys. (Netherlands), vol.78, no.2, p.279-94 (15 July 1983).
The accuracies of proposed interaction potentials for the Li^+-rare-gas systems are tested by comparing the transport coefficients calculated from the potentials with the experimental values. The agreement is generally good for theoretical potentials that take electron correlation into account and for potentials inferred from ion-beam measurements of high accuracy, except where the transport data are primarily influenced by the long-range tail of the potential. The transport data are also used to directly determine the Li^+-rare-gas interaction potentials, with an estimated accuracy of 10% over wide ranges of ion-atom separation. (53 refs.)

100506 On the Ne-Ne potential-energy curve and related properties. R.A.Aziz, W.J.Meath, A.R.Allnatt (Univ. of Western Ontario, London, Ontario, Canada).
Chem. Phys. (Netherlands), vol.78, no.2, p.295-309 (15 July 1983).
The construction of interatomic pair potentials according to the HFD (Hartree-Fock-dispersion) and the XC (exchange-Coulomb) models is reviewed briefly. A new XC potential is constructed for Ne; as in a successful application to Ar, the adjustable parameters in the model are fixed by fitting only second virial coefficient data. The new XC potential, two slight modifications of it, and five literature potentials, are compared with respect to their ability to predict the second virial coefficients and transport properties of dilute Ne gas, the Ne-Ne differential and total scattering cross sections, and the spectroscopic constants of the dimer. A reassessment of the experimental data leads to the conclusion that a literature HFD-C potential is less reliable than previously thought. The new potentials constructed in this paper appear preferable to the other potentials considered; they reproduce essentially all the experimental data used for test purposes to within experimental error. (71 refs.)

100507 A comparison of quantal and semiclassical perturbed-rotational-state methods in H^+-CO collisions. K.Sakimoto (Inst. of Space & Astronautical Sci., Tokyo, Japan).
Chem. Phys. (Netherlands), vol.79, no.1, p.137-46 (15 Aug. 1983).
The perturbed-rotational-state (PRS) approach introduced by Takayanagi (1982) and developed by the present author is a very powerful tool for treating low-energy ion-molecule collisions. However, all previous PRS methods are based on the semiclassical impact-parameter theory. In the present work, a quantum-mechanical PRS theory is formulated, and a preliminary application to the H^+-CO collision is performed. Semiclassical impact-parameter calculations under the assumption of a straight-line trajectory are also performed, and compared with the quantum-mechanical results. The energy range studied in the calculations covers the conditions of interstellar molecular clouds. (23 refs.)

100508 Trajectory-surface-hopping study of $Na(3p^2P)+H_2 \rightarrow Na(3s^2S)+H_2(\nu',j',\theta)$. N.C.Blais (Chem. Div., Los Alamos Nat. Lab., Los Alamos, NM, USA), D.G.Truhlar.
J. Chem. Phys. (USA), vol.79, no.3, p.1334-42 (1 Aug. 1983).
Trajectory-surface-hopping calculations involving the three lowest-energy $^2A'$ potential surfaces are reported for $Na(3p^2P)$ collisions with $H_2(\nu=0$, low $j)$ at 0.9 kcal/mol relative translational energy. In addition to the total quenching cross section, the authors report distributions of final translational energy, final vibrational and rotational quantum numbers, internal energy, scattering angle, and collision time for the quenching collisions. They also report the opacity function, the correlation of scattering angle with impact parameter, and separate product translational spectra for the forward and backward scattered halves of the quenched ensemble. These results provide a detailed picture of the chemical dynamics of a typical quenching system proceeding through a quasibound intermediate configuration with large ionic character. (27 refs.)

100509 The quantal collision integrals and transport coefficients of dilute gaseous spin-polarized deuterium with spin-polarized hydrogen and the isotopes of helium. T.K.Lim (Dept. of Phys. & Atmospheric Sci., Drexel Univ., Philadelphia, PA, USA), P.A.Maurone.
J. Chem. Phys. (USA), vol.79, no.3, p.1452-4 (1 Aug. 1983).
The collision integrals and transport coefficients of spin-polarized deuterium D↑ and its admixtures with spin-polarized hydrogen H↑ and the isotopes of helium are calculated with representative Lennard-Jones interatomic potentials at temperatures below 2K. Diffractive features previously predicted to be significant in H↑ are absent in D↑ and its admixtures. (4 refs.)

100510 Symmetry selection rules in inelastic collisions of diatomic molecules in $^3\Pi$ electron states. M.H.Alexander (Dept. of Chem., Univ. of Maryland, College Park, MD, USA), B.Pouilly.
J. Chem. Phys. (USA), vol.79, no.3, p.1545-6 (1 Aug. 1983).
Recently, considerable attention has been devoted to collisions involving open-shell diatomics, where the manifold of rotational levels is split by interactions with the electronic spin or orbital angular momenta. Some experimental work has indicated that certain transitions between the various symmetry and parity doublets are more favored than others. In a series of papers (1982, 1983) authors have shown how this type of propensity rule can be derived starting from a rigorous quantum formulation of the collision dynamics. They extend this type of analysis to collisions of molecules in $^3\Pi$ electronic states, where several new selection rules can be derived, which do not apply to the systems examined previously. (14 refs.)

100511 The dispersive collision dipole in a pair of polyatomic molecules. L.Galatry (Lab. de Phys. Moleculaire, Univ. de Besancon, Besancon, France), A.Hardisson.
J. Chem. Phys. (USA), vol.79, no.4, p.1758-65 (15 Aug. 1983).
The dipole moment appearing in a pair of polyatomic molecules during a collision, originating from the dynamic correlation of the charges between the two systems, is formulated using two different methods. The first one introduces the electro-optical effect induced in one of the partners by the fluctuating field of the other and by an externally applied field. The second method takes into account the optical rectification processes of one molecule subjected to the fluctuating field of the other. These formalisms may be applied to pairs with any molecular symmetry. An application is made to molecules belonging to the T_d group, showing that in such a case the R^{-7} part of the dispersion polarization may be competitive with inductive effects. (27 refs.)

100512 Effect of the different parts of the interaction potential on the line profile in neutral atom-atom collisions. N.F.Allard, Y.G.Biraud.
J. Phys. (France), vol.44, no.8, p.935-43 (Aug. 1983).
Line profiles of Cs perturbed by Xe are calculated in the unified theory of Anderson and Talman (1956). The short range and the long range parts of the potential are represented by two square-wells. The authors compare their respective effects on the characteristics of the profile. The results improve one's understanding of the collision process. (11 refs.)

100513 Time-dependent spectra of colliding atoms in an intense radiation field. G.Nienhuis (Fysisch Lab., Rijksuniv. Utrecht, Utrecht, Netherlands).
J. Phys. B (GB), vol.16, no.15, p.2677-93 (14 Aug. 1983).
The author expresses the time-dependent physical spectrum of any signal as a twofold convolution over frequency and time of the Page-Lampard quasi-spectrum and a smoothing function that is determined by the properties of the spectrometer. This result is applied to the collisional redistribution of intense time-dependent radiation. Without resort to the adiabatic approximation the authors derive a differential equation that determines the time-dependent redistributed spectrum for any given time variation of the incident field. In the special case of adiabatic or sudden switch on the incident radiation he evaluates the approach to the steady state of the fluorescence spectrum of a two-state atom. (21 refs.)

100514 Classical energy-sudden calculations of diffusion and viscosity cross sections for atom-diatom interactions. A.S.Dickinson, D.Richards (Dept. of Atomic Phys., Univ. of Newcastle upon Tyne, Newcastle upon Tyne, England).
J. Phys. B (GB), vol.16, no.15, p.2801-15 (14 Aug. 1983).
Trajectory calculations are reported in the sudden approximation for the Maxwellian averaged diffusion and viscosity cross sections for He-N_2, Ar-N_2 and He-CO_2 collisions. Comparison is made with classical infinite-order-sudden (IOS) calculations, also known as the Mason-Monchick approximation, and with various quantal IOS calculations. For the N_2 collisions, the energy-sudden and classical IOS results agree within 1% and differ from the quantal results by less than 2%. For the He-CO_2 collisions, the classical IOS results differ by about 5% from the energy-sudden calculations. An energy-corrected sudden approximation is introduced. This correction is significant only for viscosity-type cross sections, making a 6% difference for Ar-N_2 and He-CO_2 collisions at 300K. Criteria for the validity of the classical IOS approximation are suggested. (36 refs.)

100515 Molecular study of outer K-L shell interactions: the Na-He collisional system. C.Courbin-Gaussorgues, V.Sidis, J.Vaaben (Lab. des Collisions Atomiques et Moleculaires, Univ. de Paris-Sud, Orsay, France).
J. Phys. B (GB), vol.16, no.15, p.2817-30 (14 Aug. 1983).
A Feshbach projection operator technique involving self-consistent field (SCF) calculations in orthogonal subspaces is used to obtain diabatic orbitals of the Na-He collisional system. Analysis of the molecular orbital wavefunctions and their $\partial/\partial R$ couplings show that the Barat-Lichten correlation rule for the promoted orbital is incompatible with the diabatic smoothness criterion. The previously admitted conjecture that the strong asymmetry of the system would lead to an adiabatic behaviour of the $\sigma 1s_{He}$-$\sigma 3s_{Na}$ molecular orbital (MO) crossing is not supported by the presently calculated coupling matrix elements. The molecular mechanism for Na(3s→3p) excitation appears to be induced indirectly (as for Na-Ne collisions) by two successive curve crossings via the core-core K-L shell interaction. (39 refs.)

100516 Glory undulations in total integral collision cross sections. Centrifugal sudden calculations for Ar-N_2. D.C.Clary (Dept. of Chem., Univ. of Manchester Inst. of Sci. & Technol., Manchester, England), J.N.L.Connor, H.Sun.
Mol. Phys. (GB), vol.49, no.5, p.1139-47 (10 Aug. 1983).
The first centrifugal sudden (CS) calculations of glory undulations in total integral cross sections have been carried out for Ar-N_2 in the velocity range $g=501.2$-3258.4 m s^{-1}. A model Lennard-Jones (12, 6) interaction potential with $P_2(\cos\theta)$ anisotropy has been used and N_2 is assumed to be a rigid rotor. Close coupling (CC) calculations at three velocities have also been performed. The CS and CC calculations are used to assess the reliability of the much simpler infinite order sudden (IOS) approximation. It is found that the IOS method is a reliable technique for analysing glory undulations in the total integral cross section of Ar-N_2. The calculations are relevant to recent precise experimental measurements of glory undulations for atom-molecule collision systems. (47 refs.)

100517 Zero-energy scattering and bound states in the ^{4}He trimer and tetramer. S.Nakaichi-Maeda, T.K.Lim (Dept. of Phys. & Atmospheric Sci., Drexel Univ., Philadelphia, PA, USA).
Phys. Rev. A (USA), vol.28, no.2, p.692-6 (Aug. 1983).
Using the HFDHE2 He-He potential of Aziz et al. [J. Chem. Phys. 90, 4330 (1979)] with the Faddeev-Yakubovsky theory, the authors calculated the ^{4}He atom-triatom scattering length and found it to be −116 Å. The authors reduced the s-wave two-body t matrix to a separable form through the unitary-pole approximation and did the same for the s-wave [3+1] and [2+2] subamplitudes with the energy-dependent-pole approximation in their work. Also, the binding energies of all the states in the trimer and tetramer, and the atom-diatom scattering length, already determined in the authors' previous work with other potentials, were recalculated for the new interaction. The authors found an excited trimer bound state, apparently not an Efimov state, near the atom-diatom threshold and an atom-diatom scattering length of 195 Å. A feature of the results was the absence of an excited state in the tetramer but in its place was a resonancelike state which led to the large atom-triatom scattering length. (14 refs.)

34.50E Rotational and vibrational energy transfer

100518 On the interpretation of vibrational relaxation times. H.Teitelbaum (Dept. of Chem., Univ. of Ottawa, Ottawa, Ontario, Canada).
Can. J. Chem. (Canada), vol.61, no.6, p.1253-66 (June 1983).
Rate laws for the evolution of vibrational energy level populations are derived when the Bethe-Teller law is obeyed. It is assumed that a Boltzmann distribution is maintained via rapid V-V processes. A variety of different rate laws result depending on the size and direction of the perturbation, the extent from equilibrium, and how classical the oscillator is at the initial and final conditions. An earlier analysis by Breshear (1973) is shown to be a special case. A prescription is given for procedures to compare relaxation times obtained from shock tube experiments and from laser-induced fluorescence experiments, when T-V energy transfer processes are rate-determining. Corrections for thermal effects are included. Shock tube, fluorescence, and chemical activation experiments are proposed which provide meaningful conditions for testing the Bethe-Teller law and for testing the existence of a Boltzmann distribution. (13 refs.)

100519 Generalized rate law for vibrational relaxation of a pure diatomic gas. H.Teitelbaum (Dept. of Chem., Univ. of Ottawa, Ottawa, Ontario, Canada).
Can. J. Chem. (Canada), vol.61, no.6, p.1267-75 (June 1983).
The master equation for the vibrational relxation of a pure gas of diatomic molecules AB is reduced to a simple analytical rate law. Anharmonicity is accounted to first order, and both T-V and near-resonant V-V energy transfer processes are included with the limitation that $\Delta v=\pm 1$. Landau-Teller type transition probabilities are used to sale the rate constants. The rate law consists of a pair of simultaneous first order nonlinear differential equations—one for the mean vibrational energy, $\bar{E}$, and one for the mean squared vibrational energy E^2; or equivalently a nonlinear second order differential equation for $\bar{E}$ with respect to time, t, plus an algebraic equation for $\bar{E}^2$. The Bethe-Teller law, $\mathrm{d}\bar{E}/\mathrm{d}t=-(E-\bar{E}^{x})/\tau$, is valid only in the limit of zero anharmonicity or slow V-V processes, or when the initial population is Boltzmann, such as in shock tube experiments. A population distribution which is initially Boltzmann will remain so; whereas a nonBoltzmann distribution rapidly becomes a Boltzmann distribution on a time scale determined by the sum of T-V and V-V rate constants. The study allows one to gauge the importance of two common assumptions: the validity of the Bethe-Teller law and the existence of a Boltzmann distribution or vibrational temperature during the relaxation. (14 refs.)

100520 Solutions of the generalized rate law for vibrational relaxation of a pure diatomic gas. H.Teitelbaum (Univ. of Ottawa, Ottawa, Ontario, Canada).
Can. J. Chem. (Canada), vol.61, no.6, p.1276-87 (June 1983).
The generalized rate law for the relaxation of the vibrational energy of a pure diatomic gas, AB, derived by the author, (ibid., vol.61, no.6, p.1266, 1983) is solved analytically for a variety of initial conditions corresponding to shock tube, laser-excited fluorescence, and chemical activation experiments The resulting expressions can be used to easily predict whether a given system will relax according to a V-V or a T-V mechanism or both. The initial conditions and the molecular anharmonicity are as important, if not more important, for this purpose than the ratio of T-V and V-V rate constants. Behind shock waves the energy relaxes exponentially with a T-V time constant. The initial distribution remains Boltzmann. A short survey of various laser and chemical excitations in the literature is presented and analyzed in terms of initial conditions. In general, the larger the degree of excitation and the higher the quantum numbers of the excited levels, the more V-V character does the energy relaxation have. The master equation for the time evolution of individual level populations is reduced to a simple form for times applicable to the early V-V redistribution of vibrational energy. This leads to a simple prescription for extrapolating measured population distributions back towards the initial distributions produced by a chemical reaction. The general features of the time-evolution profiles are found by numerical integration to show an initial broadening of the distribution simultaneous with a shift towards $v=0$. (51 refs.)

100521 Surface hopping trajectory calculations for electronic rotational and vibrational inelastic collisions for the Na-N_2 system. P.Archirel (Lab. de Chimie, ENSJF, Montrouge, France), P.Habitz.
Chem. Phys. (Netherlands), vol.78, no.2, p.213-27 (15 July 1983).
The processes $Na(^2P)+N_2[^2\Sigma(v,j)]\rightleftharpoons Na(^2S)+N_2[^2\Sigma(v',j')]$ have been investigated by classical trajectory calculations on the three lowest potential surfaces of the system Na-N_2. The transition probabilities at the real and avoided crossings were determined according to the linear model. The coupling matrix elements for rotation of the quasimolecule NaN_2 were calculated with the aid of the Hellmann-Feynman theorem and those for the relative movement of the three atoms were extracted from the splitting of the adiabatic potential surfaces according to the Landau-Zener model. The total and differential cross sections for the quenching, the excitation and the elastic processes are in good agreement with experiment. The detailed theoretical results give a better understanding of the mechanism of the processes. (30 refs.)

100522 Collisional and radiational energy transfer in the system $Na^*(3^2P)+Na_2\ (X^1\Sigma^+)\rightarrow Na(3^2S)+Na_2^*(A^1\Sigma^+)$. P.Arrowsmith, S.H.P.Bly, P.E.Charters, P.Chevrier, J.C.Polanyi, H.H.Telle (Dept. of Chem., Univ. of Toronto, Toronto, Canada).
Chem. Phys. (Netherlands), vol.79, no.1, p.31-40 (15 Aug. 1983).
An experimental study of electronic energy transfer to electronic-plus-vibrational excitation, E→E, V, has been performed in the system $Na^*(3^2P)+Na_2\ (X^1\Sigma^+)$ under low-pressure conditions. The Na* was produced in the chemical reaction $F+Na_2\rightarrow NaF+Na^*$. Emission spectra of Na_2 (A-X) showed that $Na_2(A^1\Sigma^+)$ was populated by collisional transfer, $Na^*+Na_2\rightarrow Na+Na_2^*$, as well as by absorption of sodium D-line radiation. Simulations of the experimentally observed spectra indicated that both resonant and non-resonant channels contributed to the Na^*+Na_2, E→E, V collisional energy transfer. The relative contributions of the two pathways for collisional energy transfer were found to be ≈20% resonant and 80% non-resonant. (39 refs.)

100523 Theoretical investigation of rotational rainbows in $K+N_2$ and K+CO collisions. D.Hausler, R.Schinke (Max-Planck-Inst. fur Stromungsforschung, Gottingen, Germany).
Chem. Phys. (Netherlands), vol.79, no.1, p.147-58 (15 Aug. 1983).
The appearance of rotational rainbows in $K+N_2$ and K+CO collisions is investigated using ab initio SCF potential surfaces. The scattering calculations are performed within the semiclassical coupled-states (SCCS) approximation which is a combination of the semiclassical IOS and CS approximation. The authors demonstrate that this method is ideally suited to study rotational excitation in impulsive collisions. The results are compared with the experimental data of Beck et al. (1979) and satisfactory agreement is obtained for $K+N_2$. For K+CO the authors have the interesting situation that the more inelastic rainbow is nicely reproduced while the other occurring at lower transitions is poorly described. It is shown that failures of the potential surface are responsible for this artifact. The isotope effect observed experimentally in $K+C^{16}O$ and $K+C^{18}O$ collisions is accurately reproduced and an interpretation in terms of the potential surface is given. (33 refs.)

100524 A new semiclassical approach to the molecular dynamics: label variable classical mechanics. S.Shi (Dept. of Chem., Univ. of California, Berkeley, CA, USA).
J. Chem. Phys. (USA), vol.79, no.3, p.1343-52 (1 Aug. 1983).
A new semiclassical approach to molecular collision dynamics is developed. In this approach the state of a system is described by a unit vector in Hilbert space. By choosing a reference unit vector and a continuous mapping, a correspondence between the vector in Hilbert space and the point in a label space is established, i.e. the vector in Hilbert space is parametrized or labeled by complex variables. It is shown that the label variables formally obey classical mechanics. Thus, the time evolution of the vectors in Hilbert space, i.e. the evolution of the states of the system, can be determined by calculating the evolution of the label variables classically. To illustrate this idea, the formalism for calculating the vibrational transition probability in the collinear collision A+BC is presented, and a demonstrative calculation for the collinear Secrest-Johnson model of $He+H_2$ vibrationally inelastic scattering has been carried out. The comparison with the exact quantum results shows that the agreement is encouragingly good. (12 refs.)

100525 Vibrational relaxation of NO^+ (v) ions in neutral collisions. W.Dobler, W.Federer, F.Howorka, W.Lindinger (Inst. fur Experimentalphys., Innsbruck, Austria), M.Durup-Ferguson, E.Ferguson.
J. Chem. Phys. (USA), vol.79, no.3, p.1543-4 (1 Aug. 1983).
Vibrational relaxation of neutral molecules has been an active subject for a long time and a wealth of data exists. Until recently, almost no data has been available for collisional vibrational relaxation of molecular ions. The use of selected ion flow drift tubes with monitor ion probes for vibrational state now allows such measurements from thermal to ~1 eV collision energy. Vibrational relaxation of N_2^+ ($v=1$) ions by Ne, N_2, O_2, and CO_2 and by Kr and NO have been measured previously. authors report preliminary results on vibrational quenching of $NO^+(v)$. Ions are produced by impact of ~15 eV electrons on dilute NO in H and injected into the FDT by a Venturi inlet and detected by a quadrupole mass spectrometer. The ion energy was varied from thermal to ~1 eV by an applied electric field. (12 refs.)

100526 Beam-gas collision system for excitation cross-section measurements. J.M.Madson, E.A.Theby (McDonnell Douglas Res. Labs., McDonnell Douglas Corp., St. Louis, MO, USA).
Rev. Sci. Instrum. (USA), vol.54, no.8, p.958-66 (Aug. 1983).
A beam-gas collision experiment to measure excitation cross sections for translation-to-vibration (T-V) energy-transfer collision processes that produce short-wavelength infrared radiation (SWIR) has been assembled and used to obtain the $(0,0^\circ,0\rightarrow 0,0^\circ,1)$ excitation cross section for CO_2 by collision with Ar. A unique modulation technique used in this system involves pulse-modulating one of the reactants, injecting the pulses into a flowing plasma carrier, supersonically expanding the pulse and carrier, and extracting a beam from the expansion while preserving the modulation of the reactant. Enhanced radiation due to thermalization of excited CO_2 at sphere pressures greater than single collision conditions, has been measured and a correction factor for this effect obtained. Measurements of the argon velocity and flux in a helium beam, CO_2 number density in an integrating sphere, and infrared radiation at 4.25 μm were made to determine the excitation cross section at a collision velocity of 2.3 km s^{-1}. The average of three sets of measurements yields a value of $\sigma^*=3.7(\pm 3)\times 10^{-19}$ cm^2. (13 refs.)

100527 Intershell transition of atomic electrons during inner-shell ionization by heavy-ion impact. T.Mukoyama (Inst. for Chem. Res., Kyoto Univ., Kyoto, Japan).
Bull. Inst. Chem. Res. Kyoto Univ. (Japan), vol.61, no.1, p.30-5 (March 1983).
Expressions for probabilities of electron transition between *K* and *L* shells during ion-atom collisions have been derived using the semiclassical approximation. The *K*-shell ionization cross sections by heavy-ion impact have been modified by taking into account the intershell transition probabilities of *K*- and *L*-shell electrons. The results indicate that the effect of the intershell transition on the *K*-shell ionization cross sections is small. (13 refs.)

100528 Beam foil spectra, radiative lifetimes and transition probabilities of carbon. Liu Jiarui, Yu Guiju, Liu Wanyin (Inst. of Phys., Acad. Sinica, Peking, China), Wang Duanwei, Liu Hanpeng, Sun Yinguan, Shang Shixuan.
Nucl. Tech. (China), no.2, p.22-4 (April 1983). In Chinese.
When a monoenergetic (175 keV, 1 μA) beam of $^{12}C^+$ ions passed through a $5\sim10$ $\mu g/cm^2$ carbon foil, a beam-foil spectroscopic source of atomic and ionic carbon was produced in various stages of ionization and electronic excitation. Spectra, radiative lifetimes and transition probabilities had been obtained by the beam-foil method for many excited terms in C II and C III. (7 refs.)

100529 Hermitean DIM model for potential energy surfaces relevant to chemiionization processes. J.Vojtik, I.Paidarova (J. Heyrovsky Inst. of Phys. Chem. & Electrochem., Czechoslovak Acad. of Sci., Prague, Czechoslovakia).
Chem. Phys. Lett. (Netherlands), vol.99, no.2, p.93-7 (29 July 1983).
A new version of the diatomics-in-molecules (DIM) approach to the calculation of basic characteristics of chemiionization processes is presented. In this scheme the description of a resonant state (including the prediction of its width) is based on the diagonalization of only one hermitean matrix. A sample calculation on the $He(2^3S)$-H_2 system is reported. (14 refs.)

100530 Description of a measurement program for determining excitation cross section values of exhaust species. M.G.Dunn, J.A.Lordi (Aerodynamic Res. Dept., Calspan Advanced Technol. Center, Buffalo, NY, USA), S.Zakanycz.
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.366, p.50-8 (1983). (Modern Utilization of Infrared Technology VIII, San Diego, CA, USA, 26-27 Aug. 1982).
A measurement program currently underway at Calspan to determine the excitation cross section (σ^*) for the interaction of CO_2 and H_2O molecules with atomic oxygen is described. A shock-tube technique is used to drive a monoenergetic stream of atomic oxygen, in a helium plus argon diluent, into a jet of target gas injected normal to the incident beam. Subsequent radiation resulting from the collisional interaction of the highly expanded beams is observed immediately downstream using a filtered indium antimonide detector. With this experimental technique, measurements have been obtained for interaction velocities in the range of 4.5 to 7 km/sec. (3 refs.)

100531 Optimum argon-hydrocarbon Penning mixture ionization formula. A.E.D.Heylen (Dept. of Electrical & Electronic Engng., Univ. of Leeds, Leeds, England).
Int. J. Electron. (GB), vol.55, no.2, p.259-64 (Aug. 1983).
A general formula is presented which allows the Penning ionization in an argon-acetylene gas mixture to be directly obtained for any value of reduced electric field at any given gas added fraction. Agreement between this formula and experimental data is excellent. (7 refs.)

100532 Flowing afterglow studies of organic positive ions generated by Penning ionization using metastable argon atoms. D.R.Anderson, V.M.Bierbaum, C.H.Depuy, J.J.Grabowski (Dept. of Chem., Univ. of Colorado, Boulder, CO, USA).
Int. J. Mass Spectrom. & Ion Phys. (Netherlands), vol.52, no.1, p.65-94 (1 Aug. 1983).
Penning ionization of organic molecules has been used as a convenient, clean ion source for flowing afterglow studies of organic positive ion/molecule reactions. Ionization reactions of 36 compounds were investigated, including alkanes, alkenes, ketones, ethers, chlorides and silanes. In many cases the parent ion is produced solely, but a few compounds fragment to give a daughter ion as the only ion. Some of these ions were then studied in reactions with their parent neutral molecules and in hetero-ion/molecule reactions. The combination of mild ionization and rapid thermalization in helium buffer gas circumvents complications from excited reactants. The reactions between ethylene radical ion and ethylene were examined in detail and the results are compared with both low-and high-pressure results in the literature. Rate constants and branching ratios were measured and mechanistic implications are discussed. It was determined that the loss of metastable argon by diffusion and destruction at the walls is considerably slower than the comparable loss of ions and this must be taken into account in kinetic measurements. Other reactions, including proton transfer equilibria, were also studied briefly. (40 refs.)

100533 Study of $O_2(^1\Delta)$ production in a glow discharge at large molar flow rates. L.Torchin, R.Jegou, H.Brunet (Labs. de Marcoussis, Centre de Recherches de la Campagnie Generale d'Electricite, Marcoussis, France).
J. Chem. Phys. (USA), vol.79, no.4, p.2100-2 (15 Aug. 1983).
Derwent and Thrush (Faraday Discuss. Chem. Soc., vol.53, p.162, 1972) suggested that the nearly resonant energy transfer $O_2(^1\Delta)+I(^2P_{3/2})\rightleftarrows O_2(^3\Sigma)+I(^2P_{1/2})$ could be used to produce laser action in atomic iodine. Considerable efforts have been devoted to singlet oxygen production. As an iodine laser would require molar flow rates and pressure around 5-10 m mol./s and 10 Torr, the authors have studied $O_2(^1\Delta)$ production in an electric discharge under such conditions. Atomic oxygen, a rather efficient deactivator of singlet oxygen, has also been measured. (9 refs.)

100534 Ionisation of atomic hydrogen by 4.8 MeV C^{6+} ions. M.B.Shah, H.B.Gilbody (Dept. of Pure & Appl. Phys., Queen's Univ. of Belfast, Belfast, N Ireland).
J. Phys. B (GB), vol.16, no.15, p.L449-52 (14 Aug. 1983).
A crossed-beam coincidence counting technique incorporating time-of-flight spectroscopy, previously developed in the authors' laboratory, has been used to determine the cross section for ionisation of H(1s) atoms by C^{6+} ions at 400 keV amu^{-1}. The result is compared with previous measurements for bare nuclei projectiles and with recent theoretical predictions. (15 refs.)

100535 Inverted cusps in electron spectra near zero velocity in an attractive Coulomb field. J.Burgdorfer (Univ. of Tennessee, Knoxville, TN, USA).
Phys. Rev. Lett. (USA), vol.51, no.5, p.374-7 (1 Aug. 1983).
An inverted cusp in the near-zero-velocity electron-loss spectrum for a $2p$ ($m=0$) initial state is predicted for an attractive final-state Coulomb interaction. The dip occurs in the singly differential cross section $d\sigma/d\nu_e$, calculated in Born approximation, at $\nu_e=\nu_P$, where the electron velocity ν_e matches the projectile velocity ν_P and where the familiar cusp normally appears. The dip becomes more pronounced with increasing projectile velocities $\nu_P\rightarrow\infty$. Its existence is traced to the odd Π_z parity of the initial state. (13 refs.)

100536 Projectile ionization in fast heavy-ion-atom collisions. D.Schneider (Phys. Div., Argonne Nat. Lab., Argonne, IL, USA), M.Prost, N.Stolterfoht, G.Nolte, R.Du Bois.
Phys. Rev. A (USA), vol.28, no.2, p.649-55 (Aug. 1983).
Electron emission following the ionization of projectile ions has been investigated systematically in collisions with Ne^{q+} and Ar^{q+} ions at several hundred MeV incident on different target gases. The projectile electrons are concentrated within one maximum, the electron-loss peak (ELP). The variation of the shape and intensity of the ELP with the projectile energy, its charge state, the observation angle, and the target gas has been measured. Theoretical predictions which are based on the binary-encounter approximation show, in general, good agreement with the experimental data. The contributions of the different subshells to the ELP are deduced. It is shown that electronic screening of the target nucleus plays an important role in the ionization process of the projectile ions. (18 refs.)

100537 Experimental evidence of beam-foil convoy electrons being produced by an electron transfer to the continuum mechanism. P.Focke, W.Meckbach, C.R.Garibotti, I.B.Nemirovsky (Centro Atomico Bariloche, Comision Nacional de Energia Atomica, Bariloche, Argentina).
Phys. Rev. A (USA), vol.28, no.2, p.706-12 (Aug. 1983).
The origin of beam-foil convoy electrons has been a subject of many controversial interpretations and discussions. In this work, velocity distributions of electrons ejected into the forward direction from a carbon-foil target have been measured with incident proton beams of energies between 60 and 300 keV, and under the same experimental conditions as equivalent measurements recently performed in this laboratory with a He-gas target. Cusp widths are discussed as a function of projectile velocity and instrumental angular acceptance by taking fractional peak heights from the base line as well as by previously subtracting a background obtained by joining peak tails. It is concluded that neither of these procedures is valid. On the other hand, measured electron spectra can be well fitted in terms of a general parametric expression of the scattering amplitude for an electron transfer to the continuum process The absence of a strong negative cusp skewness, as was observed with the gas target, hints in the direction of an electron loss rather than an electron capture to the continuum process. A significant background contribution that is absent for a single-collision electron transfer to the continuum process is interpreted as due to the emission of secondary electrons that are not correlated to the emerging projectiles. (23 refs.)

100538 Electric field ionization of foil-excited Rydberg states of fast heavy ions. E.P.Kanter, D.Schneider, Z.Vager (Phys. Div., Argonne Nat. Lab., Argonne, IL, USA).
Phys. Rev. A (USA), vol.28, no.2, p.1193-4 (Aug. 1983).
The absolute yield of beam-foil-excited Rydberg states is measured, with the use of field-ionization techniques, for 125-MeV sulfur ions. The result, which agrees with a simple estimate, is compared with yields inferred from recent measurements of delayed *K* X-rays. (10 refs.)

100539 The production of charged fragments of energetic hydrogen cluster ions by interaction with an H_2O gas target. P.R.W.Henkes (Inst. fur Kernverfahrenstech., Kernforschungszentrum Karlsruhe, Karlsruhe, Germany), U.Pfeiffer.
Int. J. Mass Spectrom. & Ion Phys. (Netherlands), vol.52, no.1, p.43-57 (1 Aug. 1983).
Hydrogen cluster ions of 800 keV were passed through an H_2O gas target. The production and destruction of charged fragments was followed as a function of the target thickness. The comparison of the experimental results with those of a model calculation shows that the dominant process for fragment production is most probably the evaporation of H_2 molecules. Indications of the luminescence of clusters after electron impact are found from a background signal. (16 refs.)

100540 Electron capture process in proton-alkali atom collisions. K.B.Choudhury, D.P.Sural (Dept. of Phys., Jadavpur Univ., Calcutta, India).
Indian J. Phys. Part B, vol.57B, no.1, p.20-6 (Feb. 1983).
The electron capture process in proton-alkali atom collisions is studied using the wave formulation of the impulse approximation. Differential and integral cross sections for electron capture from sodium into the ground state of hydrogen are calculated for incident energy varying from 50 to 500 keV. The results are compared with those from other available works. (6 refs.)

100541 Multiple scattering of neon ions in helium in the presence of magnetic focusing. S.Kundu, T.Chakraborty, S.B.Karmohapatro (Saha Inst. of Nuclear Phys., Calcutta, India).
Indian J. Phys. Part B, vol.57B, no.1, p.51-6 (Feb. 1983).
Reports the indirect evaluation of lateral multiple scattering distributions from the peak current density of 1.5-10 keV Ne^+ ion in helium target of reduced thickness $2.25\times10^{-3}<\tau<1\times10^{-2}$ in a 210° two direction focusing mass spectrometer and compare the results with the multiple scattering theory, modified to accommodate the magnetic focusing effect. The value of

the scattering parameter and the deviations of the experimental data from the scaling properties inherent in the theory due to the low range of τ is independent of magnetic focusing. The total collision cross section of neon ions in helium is also evaluated in the same apparatus by beam attenuation technique showing the predominance of multiple scattering over charge transfer and oscillations in the cross section curve might be due to variations in multiple scattering on electrons of the target. (11 refs.)

100542 A theoretical study of coherence effects in charge transfer collisions: application to Na-Li$^+$. A.E.Orel, K.C.Kulander (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA).
J. Chem. Phys. (USA), vol.79, no.3, p.1326-33 (1 Aug. 1983).
The authors have carried out a theoretical study of charged exchange in the Na-Li$^+$ system and have examined the effects of coherent laser preparation of excited target states. Accurate potential energy curves and nonadiabatic coupling matrix elements were obtained from ab initio, all-electron configuration-interaction calculations. These were used in determining the cross sections over a range of collision energies. Significant differences between coherent and incoherent target preparation were observed in both total and partial cross sections. (22 refs.)

100543 Measurements of cross sections for inelastic collisions between $^4He^+$ ions. B.Peart, K.Rinn, K.Dolder (Dept. of Atomic Phys., Univ. of Newcastle upon Tyne, Newcastle upon Tyne, England).
J. Phys. B (GB), vol.16, no.15, p.2831-5 (14 Aug. 1983).
Cross sections for He^{2+} production and charge transfer have been measured for collisions between two unexcited He^+ ions at centre-of-mass energies between 14 and 58 keV. In this range the cross section for He^{2+} production rose with increasing energy from 5.3×10^{-18} cm^2 to 24×10^{-18} cm^2, whilst the cross section for charge transfer increased from 5.2×10^{-18} cm^2 to about 19×10^{-18} cm^2. The measurements of charge transfer were compared with theoretical and experimental results for $He(1s^2)+He^{2+}\rightarrow He^+(1s)+He^+(1s)$. Excellent agreement was found which implies that, for interactions between $^4He^+$ ions at these energies, charge transfer proceeds almost exclusively into the ground state. (6 refs.)

100544 $He^{2+}+He$ collisions in time-dependent Hartree-Fock theory. K.R.S.Devi, J.D.Garcia (Dept. of Phys., Univ. of Arizona, Tucson, AZ, USA).
J. Phys. B (GB), vol.16, no.15, p.2837-47 (14 Aug. 1983).
Reports the results of the first calculations of single- and double-electron transfer cross sections in $He^{2+}+He(1s^2)$ collisions within the time-dependent Hartree-Fock approximation. The energy range studied is 30 to 150 keV. The total cross sections are calculated in the rotating-frame approximation; the final amplitudes are determined by projection of the time-evolved two-electron wavefunction onto atomic states with appropriate translation factors. The authors compare their results with other theoretical calculations and with experiment. (17 refs.)

100545 Charge exchange in the O^{8+}-He collision at keV amu^{-1} energies. S.Bliman, D.Hitz, B.Jacquot (CENG, Grenoble, France), C.Harel, A.Salin.
J. Phys. B (GB), vol.16, no.15, p.2849-60 (14 Aug. 1983).
Charge exchange between O^{8+} and $He(1s^2)$ is studied both theoretically and experimentally. In the energy range where capture cross sections have been measured good agreement is obtained between theory and experiments. Calculations predict that in single-electron capture the electron is transferred dominantly into O^{7+} ($n=4$), which is supported by earlier experimental work. (14 refs.)

100546 Electron transfer in alkali atom CH_3NO_2 collisions. M.A.D.Fluendy, S.Lunt (Dept. of Chem., Univ. of Edinburgh, Edinburgh, Scotland).
Mol. Phys. (GB), vol.49, no.5, p.1007-16 (10 Aug. 1983).
Vibrational and electronic excitations in alkali metal atom-nitromethane collisions at relative energies of 40-160 eV have been observed. The inelastic processes observed are similar to those seen in the analagous alkyl halide systems and are interpreted via a similar sequential electron capture and recapture mechanism. The dynamics are determined by the molecular orbital into which capture occurs with the excited state corresponding to capture into the σ^* orbital rather than the lowest unoccupied orbital (π^*) dominating the dynamics. (19 refs.)

100547 Electron capture in collisions between highly charged ions and atoms. E.Salzborn (Justus-Liebig Univ., Giessen, Germany).
Phys. Bl. (Germany), vol.39, no.7, p.200-6 (July 1983). In German.
The transfer of electrons from neutral atoms with which ions collide is a three-body problem, even in the simples case of the collision of naked nuclei with hydrogen atoms. No analytical solution of this problem is possible. Perturbation theory gives approximate solutions for the capture cross-section if the impact velocity of an ion (v) is very large compared to the orbital velocity (v_0) of the target electron. $v_0=2.19\times10^8$ cm/s for the hydrogen atom. The collision cross-section increases considerably with increasing charge of the ion and decreases steeply with increasing collision energy. Perturbation theory cannot be applied for $v\leq v_0$. The suggestion has been made to consider an adiabatically formed and decaying quasimolecule on the strength of the Coulomb forces. In multielectron systems there are numerous paths for attaining electron capture. There are further complications if several electrons are captured in one collision and if transfer ionisation by the capture of so-called 'passive' electrons takes place. At low collision energies of the order of 1keV, additional target electrons are not liberated by Coulomb ionisation, but by the release of potential energy in the capture process. This potential energy is the difference between the energies of recombination and ionisation. (15 refs.)

100548 Charge-transfer cross sections by high-velocity, completely stripped boron and carbon ions from atomic hydrogen. C.R.Mandal, S.Datta, S.C.Mukherjee (Dept. of Theoretical Phys., Indian Assoc. for the Cultivation of Sci., Jadavpur, Calcutta, India).
Phys. Rev. A (USA), vol.28, no.2, p.1144-6 (Aug. 1983).
Charge-transfer cross sections in collisions of completely stripped ions of boron and carbon with the ground state of atomic hydrogen have been calculated in the framework of the continuum-distorted-wave approximation. The total charge-transfer cross sections have also been evaluated by applying n^{-3} law from n=6 levels. The present calculated results for total cross sections are found to be in better agreement with the experimental results as compared to the existing theoretical results over the entire energy region considered. (7 refs.)

100549 Atomic charge exchanges in close collisions between N^{+q} ions and gas targets in the MeV energy range. B.Rosner, D.W.Mingay, E.Barnard (Nucl. Dev. Corp. of South Africa (Pty), Pretoria.Ltd.,S Africa).
S. Afr. J. Phys. (S. Africa), vol.6, no.1, p.1-6 (1983).
Charge state distributions of nitrogen ions after small impact-parameter collisions with nitrogen, neon, argon, krypton and xenon gases were studied. The projectiles with kinetic energies between 1.5 and 3.0 MeV and incident charge states between 1^+ and 5^+ were detected after scattering under single-collision conditions to angles between 0.2° and 4.0°. Details of the experimental set-up established in a 1.1-m diameter off-set scattering chamber are described. The results indicate that after a single close collision, the outgoing charge distributions are rather insensitive to the value of the incoming charge, the scattering angle and the target gas. Comparison with the prediction of the statistical 'compound atom' model indicates that the good agreement for the observed shapes of the outgoing charge state distributions and their average values for lower energies worsens for higher energies and heavier targets. This can be qualitatively accounted for by the possibility that under the latter conditions the randomization assumed by the model was not achieved. (13 refs.)

34.80 ELECTRON SCATTERING

100550 Electron scattering from supersonic jet-cooled molecules. J.P.Doering (Dept. of Chem., Johns Hopkins Univ., Baltimore, MD, USA).
J. Chem. Phys. (USA), vol.79, no.4, p.2083-4 (15 Aug. 1983).
Reports the first results from an experiment designed to measure the electron energy loss spectrum of rotationally and vibrationally cooled free molecules. As examples of the technique, data are presented for rotational cooling of an EUV transition in N_2 as well as cooling of a number of transitions in a typical diene: 2,3-dimethyl-1,3-butadiene (DMB). (12 refs.)

100551 Stopping power of M-shell electrons for heavy charged particles. H.Bichsel.
Phys. Rev. A (USA), vol.28, no.2, p.1147-50 (Aug. 1983).
The stopping-power data given by Khandelwal and Merzbacher (1966) have been reevaluated because, according to Choi (1973) their expressions for the M-shell form factors were in error. Present results are (20-45)% smaller. In addition, the coefficients for the asymptotic expression were calculated. (13 refs.)

100552 Electron energy degradation in neon. R.P.Singhal, D.E.Rio, P.F.Schippnick, A.E.S.Green (Dept. of Phys., Univ. of Florida, Gainesville, FL, USA).
Radiat. Res. (USA), vol.95, no.1, p.32-44 (July 1983).
Spatial (radial and longitudinal) yield spectra for electron energy degradation in neon gas for 20 eV to 1 keV incident electrons are generated using a Monte Carlo technique. The differential elastic and inelastic scattering cross sections needed for these calculations are obtained from atomic independent particle models augmented by semiempirical modifications. Numerical four-dimensional yield spectra are represented analytically within the framework of a microplume model. Some special features of two-dimensional and four-dimensional yield spectra for a gas with a high threshold energy such as neon are discussed. Finally, yields of some prominent emission lines in neon are calculated and their spatial characteristics are represented by contour diagrams. (35 refs.)

Projectile ionization in fast heavy-ion-atom collisions ....See Entry 100536

34.80B Elastic scattering of electrons by atoms and molecules

100553 Elastic and rearrangement processes in positron-hydrogen collisions. A.Mukherjee, D.P.Sural (Dept. of Phys., Jadavpur Univ., Calcutta, India).
Indian J. Phys. Part B, vol.57B, no.1, p.13-19 (Feb. 1983).
The elastic and rearrangement processes in positron-hydrogen atom collisions are studied in an integral equation approach to the second order potential method. The principal value parts of the kernels are taken into account. The integral and differential cross sections for positronium formation are calculated for incident energies between 13.6 eV and 54.4 eV, and are compared with the available results. (16 refs.)

100554 Elastic and inelastic scattering of electrons by lithium atoms. H.S.Desai, N.S.Rao (Dept. of Phys., MS Univ. of Baroda, Baroda, India).
Indian J. Phys. Part B, vol.57B, no.1, p.37-9 (Feb. 1983).
An analytical expression for the differential scattering cross section (DCS) is obtained through order (K_i^{-2}), for the elastic and inelastic scattering of electrons by lithium atoms. Yates high energy higher order Born (HHOB) and Glauber eikonal series (GES) approximations are used for these derivations. The exchange scattering amplitudes for these processes are obtained by using Lewis integral technique. The present scattering amplitudes are compared with the recent scattering amplitudes of Rao and Desai (1983). (11 refs.)

100555 A classical model for the low-energy $e^{\pm}$-H(1s) elastic scattering. P.Grujic (Inst. of Phys., Belgrade, Yugoslavia), A.Tomic, S.Vucic.
J. Chem. Phys. (USA), vol.79, no.4, p.1776-82 (15 Aug. 1983).
A new one-electron atom classical semistochastic model has been proposed and used for calculations of an electron (positron)-ground state hydrogen elastic scattering in the low-energy region. Differential cross sections are evaluated numerically for $E=6.7$ eV, within the classical trajectory, extended Monte Carlo method. The results for the electron impact appear reasonably good for $\theta>90°$, but suffer from the forward scattering divergence. Except for the backward scattering, positron results turned out to be consistently higher than for the electron impacts. A thorough discussion of the classical approach and its perspectives in $e^{\pm}$-H scattering is given and further possible elaborations are proposed. (35 refs.)

100556 The angular variation of the asymmetry in scattering of spin-polarised electrons by hydrogen. P.W.Edmunds, M.R.C.McDowell (Dept. of Math., Royal Holloway Coll., Univ. of London, Egham, England), J.van de Ree.
J. Phys. B (GB), vol.16, no.15, p.L453-8 (14 Aug. 1983).
The angular distribution of the asymmetry in scattering of spin-polarised electrons by spin-polarised hydrogen atoms has been calculated for the first

time, for the 1s-1s and 1s-2s transitions, at impact energies of 35 and 54.4 eV. A full six-state calculation was done at 54.4 eV and ten-state localised exchange calculations at both energies. The predicted behaviour of $A_{1s,1s}(\theta)$ is smooth with a maximum of about −0.25 near 20° (54.4 eV). However, $A_{1s,2s}(\theta)$ is always positive and shows a strong narrow 'resonance' near 40°. (10 refs.)

100557 Potentials obtained by inversion of e-He atomic scattering data. H.Burger, L.J.Allen, H.Fiedeldey, S.A.Sofianos (Dept. of Phys., Univ. of South Africa, Pretoria, S Africa), R.Lipperheide.
Phys. Lett. A (Netherlands), vol.97A, no.1-2, p.39-41 (8 Aug. 1983).
Local potentials for e-He atomic scattering have been obtained from phase shifts fitted to the experimental data at 2 and 19 eV by means of quantum mechanical and semi-classical WKB inversion methods. (6 refs.)

34.80D Atomic excitation and ionization by electron impact

100558 Angular distribution of electrons scattered inelastically by hydrogen atoms. H.S.Desai, N.S.Rao (Dept. of Phys., Univ. of Baroda, Baroda, India).
Curr. Sci. (India), vol.52, no.10, p.480-1 (20 May 1983).
The Yates approximation (1979) is a small angle and high energy approximation. The main advantage of this approximation is that it is computationally simple and higher order Born terms can be obtained in the closed form. There is no problem of divergent integrals. This approximation is further simplified and has been applied to various atoms for the elastic processes. In all these problems, first two Born terms were derived according to Yates and the third Born term was approximated by the third Glauber eikonal series (GES) term of Yates. An attempt is made to calculate differential cross-section (DCS) for H(1S-2S) inelastic scattering. (8 refs.)

100559 Electron-impact ionization cross sections for Li and Na. V.Strzondala (Vysoka Skola Banska, Ostrava, Czechoslovakia).
Cesk. Cas. Fyz. Sekce A (Czechoslovakia), vol.33, no.3, p.251-8 (1983). In Czech.
Electron-impact ionization cross sections for Li and Na have been computed using some theoretical, semiempirical and empirical methods. The results of the calculations are plotted in diagrams and tables which, for comparison, also present the experimental results previously reported in the literature. (22 refs.)

100560 Determination of atomic cross-sections for electron impact excitation using effective Feynman diagrams and Einstein coefficients. S.Eliezer, D.Salzmann (Soreq Nuclear Res. Center, Yavne, Israel).
Laser & Part. Beams (GB), vol.1, pt.1, p.97-101 (Feb. 1983).
An 'effective Feynman diagram' technique is introduced to obtain relations between the cross-sections of various atomic processes. The technique is used to obtain a simple relation between the cross-sections of electron impact excitation and resonant photon absorption. The method is important because calculations of complicated atomic wavefunctions are eliminated. (15 refs.)

100561 Electron impact excitation of helium-like ions in Coulomb Glauber approximation. II. M.Kumar, S.N.Singh, A.N.Tripathi, M.K.Srivastava (Dept. of Phys., Univ. of Roorkee, Roorkee, India).
Indian J. Phys. Part B, vol.57B, no.1, p.1-5 (Feb. 1983).
For pt.I see Paramana (India), vol.16, no.6, p.457-65 (1981). Electron impact excitation integrated cross sections for $2^3s \rightarrow 2^3p$, $2^3s \rightarrow 3^3p$ and $2^3p \rightarrow 3s$ transitions in C^{4+}, N^{5+}, O^{6+} and Ne^{8+} are evaluated using Coulomb-Glauber approximations. The results are presented in terms of scaled integrated cross section $Z^4\sigma$ against scaled energy E/Z^2. (8 refs.)

100562 A higher order model for inelastic electron-atom scattering. D.P.Dewangan (Phys. Res. Lab., Ahmedabad, India).
Indian J. Phys. Part B, vol.57B, no.1, p.57-62 (Feb. 1983).
A new theoretical model, which fully incorporates the second Born amplitude under a closure approximation and which, in the limit of asymptotically high energy, reduces to the unrestricted Glauber approximation, is developed. A preliminary application of the model to the e-H(2*s*) excitation at 54.4 eV gives encouraging agreement with the differential cross sections measured by Williams (1981). (21 refs.)

100563 K-shell doubly differential cross sections for ionization of atoms. J.N.Das, S.Chakraborty (Dept. of Appl. Maths., Univ. Coll. of Sci., Calcutta, India).
Indian J. Phys. Part B, vol.57B, no.1, p.63-6 (Feb. 1983).
Doubly differential cross sections for the *K*-shell ionization have been calculated using a new model of the potential for the atomic scattering electron, proposed by the authors. A way of choosing the parameter in the potential is also suggested. Certain amendment to the earlier calculation has been made in order to remove some unsatisfactory aspects of the previous calculation of the authors. The results are presented in tabular form and agree better with the experimental results in general. (5 refs.)

100564 State-to-state differential and integral cross sections for vibrational-rotational excitation and elastic scattering of electrons by N_2 at 5-50 eV: calculations using extended-basis-set Hartree-Fock wave functions. J.R.Rumble,Jr. (NBS, Washington, DC, USA), D.G.Truhlar, M.A.Morrison.
J. Chem. Phys. (USA), vol.79, no.4, p.1846-58 (15 Aug. 1983).
The authors have calculated differential, integral, and momentum-transfer cross sections for vibrational-rotational excitation as well as for pure rotational excitation, pure vibrational excitation, and elastic scattering for electron collisions with N_2 at 5-50 eV impact energy. Scattering calculations were carried out in the fixed-nuclei approximation and excitation cross sections obtained using the sudden approximation. The interaction potential used in these calculations consists of three terms: static and local-exchange potentials, calculated from extended-basis-set Hartree-Fock wave functions as functions of internuclear distance, and a semiempirical polarization potential. Two different local exchange potentials were employed. The results are compared to each other, to previous calculations, and to experiment. (71 refs.)

100565 Treatment of resonances with the dilated electron propagator: the ^2P shape resonance in *e*-Mg scattering. M.Mishra, H.A.Kurtz, O.Goscinski, Y.Ohrn (Dept. of Quantum Chem., Uppsala Univ., Uppsala, Sweden).
J. Chem. Phys. (USA), vol.79, no.4, p.1896-902 (15 Aug. 1983).
The dilated electron propagator technique based on an underlying bivariational SCF and a second order self-energy is applied to study the ^2P shape resonance in *e*-Mg scattering. Basis set effects are studied and comparisons with the results from an alternative construction of the second order dilated electron propagator are made. (27 refs.)

100566 *R*-matrix calculation for the excitation of the lowest-lying autoionising level in lighter alkali metal atoms. S.N.Tiwary (Dept. of Appl. Math. & Theoretical Phys., Queen's Univ. of Belfast, Belfast, N Ireland).
J. Phys. B (GB), vol.16, no.15, p.L459-63 (14 Aug. 1983).
Low-energy electron impact total excitation cross sections of the lowest-lying autoionising level generated due to the inner-shell electron excitation $1s^22s^22p^63s^2S^e \rightarrow 1s^22s^22p^53s^{22}P^0$ and $1s^22s^22p^63s^23p^64s^2S^e \rightarrow 1s^22s^22p^63s^23p^54s^{22}P^0$ complex transitions in lighter alkali metal atoms i.e. sodium (Na) and potassium (K) atomic systems respectively have been calculated using single configuration Hartree-Fock (HF) wavefunctions for both initial and final states within the *R*-matrix method in the low bombarding energy region. The present calculated theoretical results differ significantly in nature from all earlier predictions and also disagree with the estimated values of the contribution of the lowest-lying autionising level to direct ionisation on the basis of the classical scaling law reported by McDowell (1969). (19 refs.)

100567 Electron-collision excitation cross section of the silver atom. A.Yu.Krasavin, A.N.Kuchenev, Yu.M.Smirnov.
Opt. & Spectrosc. (USA), vol.54, no.1, p.11-13 (Jan. 1983). Translation of: *Opt. & Spektrosk. (USSR)*, vol.54, no.1, p.20-4 (Jan. 1983).
The cross sections for direct excitation by electron collision were measured for fifteen transitions of the silver atom. For thirteen of these transitions the optical excitation functions were recorded, varying the energy of the exciting electrons from the threshold energy to 250 eV. The operating region of the spectrum was 2000-5500 Å. The excitation cross sections of the two principal lines exceeded the excitation cross sections of all the remaining lines by more than an order of magnitude. Reabsorption of the resonance lines was detected from the change in the ratio of intensities of the lines at 3280.68 and 3382.89 Å, and so their intensity has been corrected relative to the intensities of the nonreabsorbed lines. All radiative transitions, with the exception of resonance transitions, participate in cascade population of the lowest resonance levels, making it possible to determine the resulting direct excitation cross sections of the $5p^2P_{1/2}$ and $5p^2P_{3/2}$ levels from the ground state of the silver atom. The part played by cascade population of the resonance levels is not large and is <8% for the $5p^2P_{3/2}$ level, and 10% for the $5p^2P_{1/2}$ level, of the excitation cross sections of the corresponding resonance transitions. (5 refs.)

100568 Eikonal exchange amplitude for the excitation of hydrogen-like ions by electron impact. H.Kotegawa (Dept. of Phys., Hiroshima Univ., Hiroshima, Japan), W.-J.Chen, H.Narumi.
Prog. Theor. Phys. (Japan), vol.69, no.5, p.1369-76 (May 1983).
Validity of the Coulomb-eikonal approximation is examined in an excitation process of hydrogen-like ions. In particular, the Coulomb-eikonal exchange amplitude if formulated with a general expression which is reduced to a two-dimensional integral. The exchange amplitude evaluated for every excitation process from an arbitrary state (n,l,m) to any other state (n',l',m'). It is noted that the cross section calculated by this approximation with exchange never depends on any indefinite constant phase. (10 refs.)

100569 Angular and energy distributions of secondary electrons from helium. Slow electrons ejected by electron impact. Yong-Ki Kim (Argonne Nat. Lab., Argonne, IL, USA).
Phys. Rev. A (USA), vol.28, no.2, p.656-66 (Aug. 1983).
Recommended angular and energy distributions of slow secondary electrons produced from helium by electron impact are presented in a compact table. The table lists coefficients for the Legendre polynomials from which all angular and energy distributions can be generated for scattering angles between 0° and 180°, secondary-electron energies between 0 and 40 eV, and incident-electron energies between 100 2000 eV. The distributions represent double-differential cross sections that are consistent with expected asymptotic behavior, angular symmetry, and integrated cross sections. These cross sections should be sufficiently reliable to serve as normalization standards for experiments on secondary-electron distribution. (32 refs.)

100570 Application of the asymptotic Green's-function approximation to e^--H scattering. S.N.Tiwary (Dept. of Appl. Math. & Theoretical Phys., Queen's Univ. of Belfast, Belfast, N Ireland).
Phys. Rev. A (USA), vol.28, no.2, p.751-5 (Aug. 1983).
The author performed calculations for the excitation of the $2p_m$ states of the hydrogen atom by electron impact for λ, χ, and $d\sigma/d\Omega$ within the recently proposed asymptotic Green's function approximation, and the results are compared with the experimental observations and other theoretical predictions. Agreement between the author's calculated results and experimental data is reasonably good. (20 refs.)

34.80G Molecular excitation, ionization, and dissociation by electron impact

100571 Metastable decomposition of $Ar_3{}^+$ cluster ions into $Ar_2{}^+$ and Ar^+. K.Stephan, T.D.Mark (Inst. fur Experimentalphys., Leopold Franzens Univ., Innsbruck, Austria), E.Mark, A.Stamatovic, N.Djuric, A.W.Castleman,Jr..
Beitr. Plasma Phys. (Germany), vol.23, no.4, p.369-72 (1983).
The authors present the first account of a study of metastable (unimolecular decay) and collision-induced dissociation of $Ar_3{}^+$ cluster ions using an experimental setup consisting of a molecular beam-electron impact ion source and a double focusing (reversed Nier Johnson geometry) mass spectrometer. The existence of the following metastable decay processes (accessible by the

authors sampling time window) could be demonstrated: $Ar_3^{+*} \rightarrow Ar_2^+$ and $Ar_3^{+*} \rightarrow Ar^+$. The processes were studied as a function of electron impact energy. The present results are of importance in order to provide some guidance for the development of appropriate theoretical models for the dissociation of cluster ions. (21 refs.)

100572 Molecular and fragment ion structure for ortho- and meta-xylene isomers. F.H.Abd El-Kader, A.A.Shokhba (Phys. Dept., Cairo Univ., Cairo, Egypt).
Int. J. Mass Spectrom. & Ion Phys. (Netherlands), vol.52, no.1, p.59-63 (1 Aug. 1983).
Metastable peak characteristics have been applied to study the fragmentation behaviour of the molecular ions and the high intensity fragment ions of the ortho- and meta-xylene isomers after electron impact. Metastable peaks for the fragmentation of ions generated by field ionization have also been studied. The kinetic energy released (T) is calculated for the decomposition of molecular and fragment ions of the two isomers in the first and second field-free regions. It is also found that the T-values are lifetime independent. (15 refs.)

100573 Inner-shell resonance in differential elastic scattering of electrons from N_2. F.A.Rajgara, A.Roy, D.Mathur (Tata Inst. of Fundamental Res., Bombay, India).
Indian J. Phys. Part B, vol.57B, no.1, p.32-6 (Feb. 1983).
A new channel for detection of resonances associated with electron-impact excitation of inner-shell electrons is reported. A shape resonance in N_2 is located in the differential elastic cross section function at an electron energy of 401.9 eV. (6 refs.)

100574 Local model exchange potentials. S.Sur, A.S.Ghosh (Dept. of Theoretical Phys., Indian Assoc. for the Cultivation of Sci., Calcutta, India).
Indian J. Phys. Part B, vol.57B, no.1, p.767-70 (Feb. 1983).
A new variant of model exchange potential based on free electron gas approximation has been proposed. Model calculations have been performed for e-He and e-H_2 scattering. Predicted values are found to be superior to all other existing values. (8 refs.)

100575 Vibrational excitation of CH_4 by electron impact: 3-20 eV. H.Tanaka, M.Kubo, N.Onodera, A.Suzuki (Dept. of General Sci., Sophia Univ., Tokyo, Japan).
J. Phys. B (GB), vol.16, no.15, p.2861-9 (14 Aug. 1983).
Differential cross sections (DCS) for the vibrational excitations ($\nu_{2,4}$, 170 meV; $\nu_{1,3}$, 360 meV) of CH_4 by electron impact have been investigated for incident energies of 3 to 20 eV in the range of 30 to 140° using a crossed-beam apparatus. Integral and momentum transfer cross sections are calculated from the DCS. At about 7.5 eV, the angular distribution shows d-wave behaviour, and the integral cross sections are enhanced to about 10^{-16} cm^2. The parameters of angular correlation theory with the irreducible tensor method for the T_2 molecular symmetry of CH_4 were obtained by fitting. It was found that the d wave alone suffices to explain the angular distributions due to the presence of a broad resonant excitation process in the $\nu_{2,4}$ and $\nu_{1,3}$ channels. At incident energies of 10 to 20 eV, the angular distributions are isotropic within the experimental error. At lower energies of 3 to 5 eV, the distributions are practically constant within the angular range of 40 to 140°, but the cross sections continuously increase towards smaller angles. (13 refs.)

100576 Calculation of the polarization potential for e-N_2 collisions. K.Onda, A.Temkin (Lab. for Astron. & Solar Phys., NASA/Goddard Space Flight Center, Greenbelt, MD, USA).
Phys. Rev. A (USA), vol.28, no.2, p.621-31 (Aug. 1983).
A polarization potential (V_{pol}) for e-N_2 collisions is calculated by the generalization of the static part of the method of polarized orbitals to molecular targets. Partial differential equations (PDE) are derived for polarized orbitals, which are functions of the distance (r) from the molecular center and angle (θ) from the molecular axis. The equations are solved with the use of the noniterative PDE technique. From the polarized orbitals a polarization potential can be constructed whose r and θ dependence is found to be significantly different from the well-known phenomenological one. The two potentials are further compared by carrying out limited hybrid-theory scattering calculations. Only those scattering results based on the calculated V_{pol} are in satisfactory accord with experiment. (28 refs.)

100577 Dissociative recombination in low-energy e-H_2^+ collisions. A.Giusti-Suzor (Lab. de Photophys. Moleculaire, Univ. de Paris-Sud, Orsay, France), J.N.Bardsley, C.Derkits.
Phys. Rev. A (USA), vol.28, no.2, p.682-91 (Aug. 1983).
The theory of configuration interaction in molecules is extended to permit the simultaneous treatment of doubly excited electronic states and vibrationally excited Rydberg states which can decay by autoionization and predissociation. The method is applied to dissociative recombination and compared with the corresponding multichannel quantum-defect theory. Calculations using both techniques are reported for collisions of electrons of energy below 0.5 eV with H_2^+ ions in the lowest three vibrational states. The Rydberg states lead to narrow structures in the cross sections, mostly in the form of dips. The cross section and recombination rate for ground-state ions are anomalously low, being smaller than those for $v=1$ and 2 by a factor of ~ 6. (33 refs.)

100578 Cross sections for electron-impact excitation of the electronic states of N_2. Lee Mu-Tao, V.McKoy (Arthur Amos Noyes Lab. of Chem. Phys., California Inst. of Technol., Pasadena, CA, USA).
Phys. Rev. A (USA), vol.28, no.2, p.697-705 (Aug. 1983).
Distorted-wave cross sections are presented for the excitations of the $w^1\Delta_u$, $W^3\Delta_u$, $A^3\Sigma_u^+$, $b'^1\Sigma_u^+$, and $c'^1\Sigma_u^+$ states of N_2 by low-energy electron impact. The distorted waves are obtained in the static-exchange field of the ground electronic state. Differential and integral cross sections are presented from near threshold up to 60-eV impact. Comparison is made with available experimental data and with other calculations. (30 refs.)

100579 Elastic and rotational excitation of the oxygen molecule by intermediate-energy electrons. P.K.Bhattacharyya (Dept. of Phys., Calcutta Univ., Calcutta, India), K.K.Goswami.
Phys. Rev. A (USA), vol.28, no.2, p.713-21 (Aug. 1983).
The Glauber-type eikonal amplitude for a fixed molecular orientation is used in the framework of adiabatic approximation to compute pure elastic excitation ($J=1 \rightarrow J'=1$), rotational excitation ($J=1 \rightarrow J'=3$), and orientationally averaged elastic cross sections of the oxygen molecule in its ground electronic and vibrational states with the use of electrons as incident particles. Both differential and integral cross sections are reported at electron energies 20-200 eV. The effect of target polarization is included in the effective electron-molecule potential used, but that of electron exchange is neglected. The results are compared with the available experimental data and theoretical calculations of other workers. A comparative study of the molecules H_2, N_2, and O_2 as targets is made. (56 refs.)

100580 Energy lost in formation of fluorine atoms in the course of electron-beam dissociation of fluorine and fluoride molecules. A.S.Bashkin, A.N.Oraevskii, V.N.Tomashov, N.N.Yuryshev (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.2, p.242-3 (Feb. 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.2, p.428-9 (Feb. 1983).
It was found that the comparison of a mixture used in a chemical HF laser influenced the energy of formation ϵ_F of a fluorine atom when fluorine and fluoride molecules were associated by an electron beam. The relative uses of ϵ_F were determined for SF_6, C_5F_{12}, and CF_4. (6 refs.)

34.90 OTHER TOPICS IN ATOMIC AND MOLECULAR COLLISION PROCESSES AND INTERACTIONS

100581 Hydrogen and deuterium atoms, stabilized by condensation of an atomic beam in superfluid helium. E.B.Gordon, A.A.Pel'menev, O.F.Pugachev, V.V.Khmelenko (Inst. of Chem. Phys., Acad. of Sci., USSR).
JETP Lett. (USA), vol.37, no.5, p.282-5 (5 March 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.5, p.237-9 (5 March 1983).
Concentrations of H and D atoms, stabilized in a molecular matrix, up to 1×10^{20} cm^{-3} are achieved by condensation of an atomic beam of superfluid helium. Transformation D atoms into H atoms is observed, indicating the occurrence of tunneling chemical exchange reactions between atomic and molecular hydrogen isotopes. (7 refs.)

100582 Effect of extrinsic electric fields upon dielectronic recombination: Mg^{1+}. K.LaGattuta, Y.Hahn (Dept. of Phys., Univ. of Connecticut, Storrs, CT, USA).
Phys. Rev. Lett. (USA), vol.51, no.7, p.558-61 (15 Aug. 1983).
Recently, large discrepancies have appeared between theoretical predictions and experimental measurements of dielectronic recombination cross sections (σ^{DR}) for Mg^{1+} targets. This disagreement has provoked new work aimed at understanding, more fully, the effect of applied fields upon the process. This Letter reports calculations of σ^{DR} for Mg^{1+} in a small applied electric field. The field effect is large enough to bring the experimental σ^{DR} into much closer agreement with the theory. (11 refs.)

100583 Rotational excitation of molecules by slow neutrons. II. B.Ritchie (Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
Phys. Rev. A (USA), vol.28, no.2, p.645-8 (Aug. 1983).
The contribution of the spin-orbit interaction to the rotationally inelastic scattering of neutrons from a closed-shell diatomic molecule is studied. For small momentum transfer and $\Delta J=\pm1$ rotational transitions, the first Born-approximation amplitude depends approximately on the factor $\Delta\omega D q^{-1}$ (in atomic units), where $\Delta\omega$ is the energy transferred, D is the permanent dipole moment of the target, and q is the momentum transferred. The dependence on $\Delta\omega D$ is the same as that of the coefficient of absorption of long-wavelength radiation, and the dependence on q^{-1} is characteristic of particle scattering in a dipole potential. Essentially $\Delta J=\pm1$ cross sections are enhanced because rotational energy transfer can occur over appreciable target-neutron distances. Thus the tiny rotational transition strength $\triangle\omega D$ is weighted by the large factor q^{-1}. This means that a classical average of the cross section over molecular orientations cannot describe the physical process. The importance of this result to the theory of neutron-optical activity is discussed. (11 refs.)

100584 Use of universal Gaspar potential for evaluating the degree of ionization of atoms in an electric field. P.P.Vaitekunas, J.J.Glembockis, A.J.Savukynas (Inst. of Phys., Acad. of Sci., Lithuanian SSR).
Sov. Phys.-Collect. (USA), vol.22, no.2, p.23-6 (1982). Translation of: *Litov. Fiz. Sb. (USSR)*, vol.22, no.2, p.30-4 (1982).
A theoretical estimate is obtained for the degree of multiple-electron atoms in a strong electric field by using the universal Gaspar potential. It is shown that the resultant degree of ionization differs little from the results provided in the Thomas-Fermi approximation, if the matching parameter for the Gaspar and Coulomb potentials is determined from the hydrogen-like approximation in the case of a strong field. 100585 Resonance neutron radiography using a pulsed neutron source and a 2-dimensional scintillation detector. M.G.Strauss, G.H.Lander, R.Brenner, C.T.Roche (Argonne Nat. Lab., Argonne, IL, USA).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.519-30
Resonance neutron radiography is an imaging technique whereby a single exposure to neutrons produces several radiographs each of which shows a

distribution of a different isotope in the object. An accelerator-based pulsed spallation source has recently been completed at Argonne National Laboratory (ANL). A 2-dimensional neutron-position scintillation detector was also recently developed. It consists of a thin (1-2 mm) ^{6}Li glass scintillator coupled to an array of photomultipliers. The neutron source and detector were used in a resonance radiography experiment in which a foil sample consisting of indium and gold were radiographed. Two images were obtained; one due to resonance absorption of 1.46 eV neutrons in ^{115}In showing the extent of indium in the sample, and the other due to absorption of 4.91 eV neutrons in ^{197}Au showing the extent of gold. A radiography experiment on nuclear fuel pellets showed resonances of the uranium and plutonium isotopes in the range of 0.3-10 eV. The area of potential applications of resonance radiography below 20 eV includes isotopes ($Z > \sim 40$) of fission products, rare earths, heavy metals, and actinides. (8 refs.)

35.10D Electric and magnetic moments, polarizability

100586 **Isoelectronic wavelength predictions for magnetic-dipole, electric-quadrupole, and intercombination transitions in the Mg sequence.** J.L.Curtis, P.S.Ramanujam (Dept. of Phys. & Astron., Univ. of Toledo, Toledo, OH, USA).
J. Opt. Soc. Am. (USA), vol.73, no.8, p.979-84 (Aug. 1983).
Precise wavelength predictions are presented for the $3s3p\ ^3P_1$-$3s3p\ ^3P_2$ magnetic-dipole transitions, the $3s3p\ ^3P_0$-$3s3p\ ^3P_2$ electric-quadrupole transitions and the $3s^2\ ^1S_0$-$3s3p\ ^3P_1$, intercombination lines for all members of the Mg isoelectronic sequence with $Z \leq 45$. Magnetic-dipole and intercombination transitions of this type have recently been observed in Tokamak spectra and have applications for localized diagnostics in high-temperature plasmas. The predictions are based on interpolations and extrapolations of empirical regularities, which also provide insights into the dynamics of these atomic systems. (37 refs.)

100587 **Determination of the high-frequency dynamic polarizability of atoms by analogy with the two-center problem.** P.P.Vaitekunas, A.Yu.Savukinas.
Opt. & Spectrosc. (USA), vol.54, no.1, p.17-19 (Jan. 1983). Translation of: *Opt. & Spektrosk. (USSR)*, vol.54, no.1, p.31-5 (Jan. 1983).
It is shown that analogy with the two-center problem can be used to examine the polarizability of atoms in a nonresonant high-frequency electromagnetic field. The principal terms in the high-frequency dipole dynamic polarizability of H, He, and Be^{2+}, obtained from energy calculations of H_2^+, H_2, and He_2^{2+} molecules at small internuclear distances, are presented. 100588 **Precise determination of the $^{171}Yb^+$ ground state hyperfine separation.** R.Blatt, H.Schnatz, G.Werth (Inst. fur Phys., Univ. Mainz, Mainz, Germany).
Z. Phys. A (Germany), vol.312, no.3, p.143-7 (1983).
The authors performed a microwave-optical double resonance experiment on the ground state of $^{171}Yb^+$ ions. About 10^5 particles were confined in a r.f. quadrupole trap for periods of several hours in the presence of He buffer gas. Hyperfine pumping by a pulsed dye laser was followed by microwave transitions, which were observed via changes in the ionic fluorescence intensity. The ground state hyperfine splitting has been determined to $\Delta W = 12642812124.2 \pm 1.4$ Hz. The ultimate line width obtained in this experiment was 33 mHz, corresponding to a line Q of 3.8×10^{11}. The final error of ΔW is mainly determined by the accuracy of the available frequency reference. (14 refs.)

35.10W Weak Interactions

100590 **Parity violation in atomic cesium and alternatives to the standard model of electroweak interactions.** C.Bouchiat, C.A.Piketty (Lab. de Phys. Theorique, Ecole Normale Superieure, Paris, France).
Phys. Lett. B (Netherlands), vol.128B, no.1-2, p.73-8 (18 Aug. 1983).
The authors study the implications of the recent observation of a parity violation in atomic cesium. After a discussion of the uncertainties associated with the atomic physics calculations they derive conservative bounds for the weak charge Q_W. These bounds are used to put constraints on alternatives to the standard electroweak model, involving an 'extra U(1)' gauge group. They analyze the possibility that the extra boson might be very light and give, as a by-product, the typical range of momentum transfer explored in atomic parity violation experiments. (20 refs.)

100591 **Computer representation of molecular surfaces.** N.L.Max (Computer Grpahics Group, Lawrence Livermore Nat. Lab., Livermore, CA, USA).
Proceedings of the Fifteenth Hawaii International Conference on System Sciences 1982, Honolulu, HI, USA, 6-8 Jan. 1982 (HI, USA: Hawaii Int. Conference Syst. Sci. 1982), p.59-66 vol.2
This review article surveys recent work on computer representation of molecular surfaces. Several different algorithms are discussed for producing vector or raster drawings of space-filling models formed as the union of spheres. Other smoother surfaces are also considered. (20 refs.)

35.20B General molecular conformation and symmetry; stereochemistry

100592 **The structure of dimethylamine.** D.C.McKean (Dept. of Chem., Univ. of Aberdeen, Aberdeen, Scotland).
J. Chem. Phys. (USA), vol.79, no.4, p.2095-6 (15 Aug. 1983).
The molecule of dimethylamine has the special interest that in each methyl group there are three bonds of differing strength, the weakest by far being that trans (antiperiplanar) to the lone pair, the strongest, that trans to the other methyl group. A least squares refinement of the geometry to fit the observed inertial constants was carried out, as in the r_0 or the preferable r_z structure, with isotopic changes to bond lengths, etc., included, these being either refined to, where the data permit, or constrained to well-established empirical values, or determined from good models. (17 refs.)

100593 **Estimation of equilibrium structure and anharmonicity by use of changes in the r_z structure by isotopic substitution and vibrational excitation. I. General formulation and application to OCl_2.** M.Nkata, S.Yamamoto, T.Fukuyama, K.Kuchitsu (Dept. of Chem., Faculty of Sci., Univ. of Tokyo, Tokyo, Japan).
J. Mol. Struct. (Netherlands), vol.100, p.143-59 (July 1983).
A general formulation is presented on the differences in the average (r_z) structure caused by isotopic substitution and vibrational excitation; the differences in the average structure for both bonded and nonbonded atomic pairs are represented as linear combinations of quadratic average values of the Cartesian displacement coordinates. This method is applicable to a joint analysis of spectroscopic and electron diffraction data so that the equilibrium geometrical parameters and effective anharmonic constants for polyatomic molecules can be estimated even when only a limited number of rotational constants for isotopic species and vibrationally excited states are available. Its application to OCl_2 molecule as an example is discussed. (28 refs.)

35.20J Barrier heights (internal rotation, inversion); rotational isomerism, conformational dynamics

100594 The story of the ammonia molecule: ten years of investigation of molecular inversion. D.Papousek (J. Heyrovsky Inst. of Phys. Chem. & Electrochem., Czechoslovak Acad. of Sci., Prague, Czechoslovakia).
J. Mol. Struct. (Netherlands), vol.100, p.179-98 (July 1983).
The application of the Hougen-Bunker-Johns (HBJ) Hamiltonian to quasi-planar molecules is discussed with special emphasis on ammonia. The double-minimum potential functions of ammonia obtained in the approximation of the rigid invertor, 'harmonic' nonrigid invertor, and 'anharmonic' non-rigid invertor are compared from the point of view of their isotopic invariancy. The HBJ Hamiltonian can also be applied with advantage to the quantitative analysis of the transition frequencies obtained by high and very high resolution spectroscopy, as well as to the interpretation of the anomalous inversional dependence of the dipole moment function, quadrupole couping or of the g-tensor function. The newly determined 'true' barrier height for ammonia inversion by fitting the experimental data on vibration-inversion-rotation transitions is 1834 cm^{-1}. (48 refs.)

35.20M Electric and magnetic moments (and derivatives), polarizability, and magnetic susceptibility

100595 Measurements of depolarization ratios of gaseous linear chain molecules: a test of the principle of the additivity of bond polarizabilities. J.E.M.Haverkort, F.Baas, J.J.M.Beenakker (Huygens Lab., Rijksuniv., Leyden, Netherlands).
Chem. Phys. (Netherlands), vol.79, no.1, p.105-9 (15 Aug. 1983).
The depolarization ratio for a number of *n*-alkanes and n-perfluoro-alkanes are reported, and a discrepancy for C_2H_6 with earlier results is explained. A simple model based upon the principle of the additivity of bond polarizabilities is shown to be in disagreement with the authors' results. A model based on the classification of chemical bonds into types and subtypes, according to the chemical environment of these bonds is shown to be in considerably better agreement with their data, although the agreement is not completely adequate. (19 refs.)

100596 Polarizabilities of interacting polar molecules. A.D.Buckingham, P.A.Galwas, Liu Fan-Chen (Chem. Lab., Univ. of Cambridge, Cambridge, England).
J. Mol. Struct. (Netherlands), vol.100, p.3-12 (July 1983).
Collision-induced polarizability in the electro-optical Kerr effect is shown to be the dominant contributor to the second Kerr virial coefficient B_K of dipolar gases. It gives a positive B_K and may be orders of magnitude larger than the contribution due to the intrinsic anisotropy in the polarizability of the free molecules, thus resolving a long-standing discrepancy between experiment and theory. The collision-induced contribution provides a reasonable fit to the observed B_K for the fluoromethanes if a simple Stockmayer-type potential is used. (27 refs.)

100597 Molecular properties of pentyl-cyano mesogens having different core structures. D.A.Dunmur, A.E.Tomes (Dept. of Chem., Univ. of Sheffield, Sheffield, England).
Mol. Cryst. & Liq. Cryst. (GB), vol.97, no.1-4, p.241-53 (1983). (Proceedings of the Ninth International Liquid Crystal Conference, Bangalore, India, 6-10 Dec. 1982).
The molecular properties of polarizability, polarizability anisotropy and dipole moment have been measured for a series of mesogenic molecules having a terminal cyano group and a terminal n-pentyl chain. Molecules investigated were of the form n-pentyl-X-cyano, where X was biphenyl, cyclohexyl-phenyl, phenyl-cyclohexyl, bicyclohexyl and bicyclo-octyl-phenyl. Measured polarizabilities were compared with bond additivity calculations for the molecules having different alkyl chain conformations. The relative nematic stabilities of the mesogens and their physical properties are discussed in terms of their measured molecular properties. (35 refs.)

100598 EOM/propagator ionization potentials: extension of the excitation operator manifold. J.Baker (Dept. of Quantum Chem., Uppsala Univ., Uppsala, Sweden).
Chem. Phys. (Netherlands), vol.79, no.1, p.117-28 (15 Aug. 1983).
The excitation operator manifold required for the calculation of vertical IPs in the EOM/propagator formalism is extended to include products of five spin orbital field operators (referred to as the $\mathbf{h}_5$ basis). Spin symmetry adaptation is used for all the operators of this manifold. Using a direct diagonalization technique introduced previously the effect of inclusion of the $\mathbf{h}_5$ basis on calculated IPs is illustrated for various levels of approximation to the electron density by numerical applications to ethylene and water. The fourth-order terms thus introduced are shown to have greater magnitude than previously included third-order terms, in agreement with earlier work. (30 refs.)

100599 Calculation of the vertical ionization potentials of XBO and XBS molecules (X=H, F and Cl) by perturbation corrections to Koopmans' theorem. D.C.Frost, C.Kirby, W.M.Lau, C.A.McDowell, N.P.C.Westwood (Dept. of Chem., Univ. of British Columbia, Vancouver, British Columbia, Canada).
J. Mol. Struct. (Netherlands), vol.100, p.87-94 (July 1983).
Vertical ionization potentials of the linear triatomic molecules, HBO, FBO, ClBO, HBS, FBS, and ClBS are computed by applying Rayleigh-Schrodinger perturbation corrections to Koopmans' theorem. Comparison with the experimental data for the XBS molecules gives the authors confidence that their theoretical values for the ionization potentials will greatly assist in the identification of the, as yet, unobserved photoelectron spectra of the XBO species. (41 refs.)

100600 A study of the first ionization potential of the $CrO(X^5\Pi)$ molecule with high-temperature photoelectron spectroscopy. J.M.Dyke, B.W.J.Gravenor, R.A.Lewis, A.Morris (Dept. of Chem., Univ. of Southampton, Southampton, England).
J. Chem. Soc. Faraday Trans. II (GB), vol.79, pt.7, p.1083-8 (July 1983).
The first band in the He I photoelectron spectrum of the $CrO(X^5\Pi)$ molecule, obtained via the gas-phase reaction $Cr+O_3$, has been recorded. The adiabatic and vertical ionization potentials of the observed band were measured as 7.85 ± 0.02 and 8.16 ± 0.01 eV, respectively. Analysis of the observed vibrational structure yielded $\tilde{w}_e=640\pm30$ cm^{-1} and Franck-Condon analysis of the vibrational envelope gave $r_e=1.79\pm0.01$ Å for the ground electronic state of the ion, which is predicted on the basis of ab initio configuration-interaction calculations to be a $^4\Sigma^-$ state. 35.80 ATOMIC AND MOLECULAR MEASUREMENTS AND TECHNIQUES

100601 Stabilization of a microwave oscillator using a resonance Raman transition in a sodium beam. R.P.Hemmer, S.Ezekiel (Res. Lab. of Electronics, MIT, Cambridge, MA, USA), C.C.Leiby,Jr..
Opt. Lett. (USA), vol.8, no.8, p.440-2 (Aug. 1983).
Preliminary results on the stabilization of a 1772-MHz oscillator to a resonance Raman transition in an atomic beam of sodium are presented. Short-term stability of 5.6×10^{-11} ($\tau=100$ sec) for a 15-cm Ramsey interaction-region separation has been achieved. Sources of frequency drift are briefly discussed. (13 refs.)

36.00 STUDIES OF SPECIAL ATOMS AND MOLECULES

36.10 EXOTIC ATOMS AND MOLECULES (CONTAINING MESONS, MUONS, AND OTHER ABNORMAL PARTICLES)

100602 μ-atom energy levels-revisited. S.Bhattacharyya (Gokhale Coll., Calcutta, India), L.Chatterjee, T.Roy.
Indian J. Phys. Part B, vol.57B, no.1, p.80-4 (Feb. 1983).
Muonic atoms have been studied in the framework of a cut-off type potential $V(r)$ such that $V(r)=-ze^2 2/r$ outside the nuclear radius, and $V(r)=(kr^2+\text{constant})$ within the nuclear boundary. The energy values agree well with those obtained by other authors. (4 refs.)

100603 Positronium formation cross sections in the inert gases. M.Charlton, G.Clark, T.C.Griffith, G.R.Heyland (Dept. of Phys. & Astron., Univ. Coll. London, London, England).
J. Phys. B (GB), vol.16, no.15, p.L465-70 (14 Aug. 1983).
New measurements of positronium formation cross sections are reported for the inert gases at energies up to 150 eV. These data show pronounced structure in the cross sections of all gases in the form of secondary peaks and plateaus above the ionisation potentials. (15 refs.)

100604 Kaonic hydrogen atom X-rays. P.M.Bird, A.S.Clough, K.R.Parker (Dept. of Phys., Univ. of Surrey, Guildford, England), G.J.Pyle, G.T.A.Squier, S.Baird, C.J.Batty, A.I.Kilvington, F.M.Russell, P.Sharman.
Nucl. Phys. A (Netherlands), vol.A404, no.3, p.482-94 (15 Aug. 1983).
The X-ray spectrum obtained with kaons stopping in liquid hydrogen has been measured. Possible candidates for X-ray lines from kaonic hydrogen atoms have been indentified and the results compared with previous experiments and with theoretical predictions. X-ray lines from Σ^-p atoms may also have been observed. (9 refs.)

100605 An optical model for kaonic atoms. C.J.Batty (Rutherford Appleton Lab., Didcot, England).
Phys. Lett. B (Netherlands), vol.127B, no.3-4, p.162-4 (28 July 1983).
It is shown that a laplacian form for the optical model potential gives a significantly improved fit to the strong interaction data for kaonic atoms. (5 refs.)

100606 Rate for positronium decay to five photons. G.S.Adkins, F.R.Brown (Joseph Henry Labs., Princeton Univ., Princeton, NJ, USA).
Phys. Rev. A (USA), vol.28, no.2, p.1164-5 (Aug. 1983).
In this report the authors calculate Γ_5, the rate for orthopositronium to decay to five photons. They find that $\Gamma_5=[0.0189(11)]\alpha^2\Gamma_{LO}$, where Γ_{LO} is the lowest-order orthopositronium decay rate. The relevance of the result to the experimental situation is discussed. (8 refs.)

100607 Hyperfine structure of muonium: an analytic solution by perturbation calculations. C.J.Wotzasek, M.A.Gregorio, S.Reinecke (Inst. de Fisica, Univ. Federal do Rio de Janeiro, Rio de Janeiro, Brazil).
Rev. Bras. Fis. (Brazil), vol.12, no.3, p.517-39 (Sept. 1982). In Portuguese.
The authors compute the purely coulomb contributions to the terms of order $E_F(\alpha^2 m_e/m_\mu)\ln\alpha^{-1}$ of the hyperfine splitting of muonium. Results agree with those of other authors. The goal of the work was twofold: first, to confirm that contribution; second, and perhaps more important, to check the analytic solution of the relativistic coulomb problem of the Bethe-Salpeter equation with instantaneous kernel. 36.20 MACROMOLECULES AND POLYMER MOLECULES

(for biological macromolecules, see also 87.15; for polymer reactions and polymerization, see 82.35)

100608 Response function theory and its application to polymer dynamics. M.S.Jhon (Dept. of Chem. Engng., Carnegie-Mellon Univ., Pittsburgh, PA, USA), J.S.Dahler.
J. Chem. Phys. (USA), vol.79, no.2, p.1013-16 (15 July 1983).
A response theory is constructed for systems with deterministic, nonrandom dynamics which are not governed by Hamiltonian mechanics. This theory is used to compute the response of a polymeric solution (modelled as elastic dumbbells suspended in a Newtonian solvent) to a flow field. This externally imposed flow displaces the system from its initial state of equilibrium and causes each function of state to respond in a characteristic way. The response function of greatest interest is the fluid stress tensor. The authors present a correlation function expression for this tensor and derive Kubo-like formulas for a number of material functions, namely, the shear and extensional viscosities and the primary and secondary normal stress coefficients associated with laminar flows. Finally, an expression is obtained for the extra stress due to turbulent flow. (7 refs.)

100609 Ab initio energy calculations for the intramolecular rotational potential of polyacetylene. B.K.Rao, J.A.Darsey, N.R.Kestner (Chem. Dept., Louisiana State Univ., Baton Rouge, LA, USA).
J. Chem. Phys. (USA), vol.79, no.3, p.1377-80 (1 Aug. 1983).
Using ab initio methods, calculations have been performed on the rotational states of polyacetylene. Using a 4-31G basis set a gauche state is found involving a 40° rotation from the cis state. It is 0.6 kcal/mol lower in energy than the cis state. The trans state is the lowest energy state with an energy 2.60 kcal/mol lower than the gauche. Trans-cisoid to trans isomerization is proposed to occur by a rotation about the single C-C bonds in the backbone with a rotational barrier of 2.61 kcal/mol. The lack of sensitivity which arises when using a STO-3G poor basis set is also demonstrated. (20 refs.)

100610 Monte Carlo study of dynamics of the multichain polymer system on the tetrahedral lattice. A.Kolinski, P.Romiszowski (Dept. of Chem., Univ. of Warsaw, Warsaw, Poland).
J. Chem. Phys. (USA), vol.79, no.3, p.1523-6 (1 Aug. 1983).
Diffusion of the chain molecules in the concentrated solutions was studied by means of the computer simulation method. The computations were made for various chain lengths and polymer concentrations. It was observed that the rate of diffusion of the polymer chains strongly depends on the chain length according to the relation $D\propto n^{-b}$. It was found that the value of exponent b increases with the polymer concentration. (16 refs.)

100611 CO binding to heme proteins: a model for barrier height distributions and slow conformational changes. N.Agmon, J.J.Hopfield (Div. of Chem., California Inst. of Technol., Pasadena, CA, USA).
J. Chem. Phys. (USA), vol.79, no.4, p.2042-53 (15 Aug. 1983).
A model for the dependence of the potential energy barrier on a 'protein coordinate' is constructed. It is based on a two dimensional potential energy surface having as variables the CO-iron distance and a conceptual protein coordinate. The distribution of barrier heights observed in kinetics follows from an initial Boltzmann distribution for the protein coordinate. The experimental nonexponential rebinding kinetics at low temperatures or large viscosities (when the protein coordinates can be assumed 'frozen') can be fit with a simply parameterized energy surface. Using the same energy surfaces and the theory of bounded diffusion perpendicular to the reaction coordinate, the authors generate (in qualitative agreement with experiment) the survival probability curves for larger diffusivity, when the constraint on the protein coordinate is relaxed. On the basis of the authors' results, the outcomes of new experiments which examine the concepts underlying the theory can be predicted. (18 refs.)

100612 Statistics of the entanglement of polymers: unentangled loops and primitive paths. E.Helfand, D.S.Pearson (Bell Labs., Murray Hill, NJ, USA).
J. Chem. Phys. (USA), vol.79, no.4, p.2054-9 (15 Aug. 1983).
Attempts to apply the reptation and tube model to describe polymer disentanglement and associated relaxations have had wide success. However, questions have arisen in various applications as to the statistics of entanglement of a random walk with an obstacle net. Calculations are presented of a number of probabilities which characterize the degree to which a polymer, represented by a lattice walk, entangles with an array of obstacles. In particular, the authors have calculated the number of ways that such a walk can form unentangled closed loops of various types. If one reels in a general random walk from its ends, pulling out unentangled loops, one is left with the so-called primitive path, which is taken to represent the path of the tube. The probability that an N step random walk has a K step primitive path has been determined. Asymptotic formulas for this probability are presented. (17 refs.)

100613 The one-dimensional n→0 vector model and the helix-coil transition. G.T.Brinke, F.E.Karasz (Dept. of Polymer Sci. & Engng., Univ. of Massachusetts, Amherst, MA, USA).
J. Chem. Phys. (USA), vol.79, no.4, p.2065-71 (15 Aug. 1983).
The one-dimensional n→0 vector model is shown to be closely related to a model describing helix-coil transitions in polypeptides. This makes available a vast amount of theory developed in this area and allows a simple derivation of the self-avoiding walk length distribution corresponding to the one-dimensional n→0 vector model. The effect of the peculiar feature of this model, the extra factor 1/2 for single site walks, is shown to be minor. The interpretation of the one-dimensional n→0 vector model as a model for helix-coil transitions commits little error and the corresponding 'helix sequence' length distribution is in a first approximation identical to the helix sequence length distribution of existing models for the helix-coil transition. The equivalence between the n→0 vector model and an equilibrium polymerization model found by Wheeler et al. (1981) implies a close connection between the self-avoiding walk length distribution and the molecular weight distribution. The results confirm the mean-field predictions that the molecular weights of the polymer species are distributed exponentially. The solution of the one-dimensional n→0 vector model shows a phase transition in the limit of zero magnetic field. (28 refs.)

100614 Position-space renormalisation group for directed branched polymers. H.J.Herrmann (Service de Physique Theorique, CENS, Gif-sur-Yvette, France), F.Family, H.E.Stanley.
J. Phys. A (GB), vol.16, no.11, p.L375-9 (1 Aug. 1983).
All previous attempts to obtain accurate quantitative estimates of critical properties for directed percolation or directed animals with the position-space renormalisation group (PSRG) have failed. The authors analyse the problems that appear in the renormalisation of directed models, and then present a PSRG that avoids these problems and gives reliable predictions. (16 refs.)

100615 On the probability distribution of the end-to-end vector of a polymer chain. M.K.Kosmas (Chem. Dept., Univ. of Ioannina, Ioannina, Greece).
J. Phys. A (GB), vol.16, no.11, p.L381-4 (1 Aug. 1983).
The author calculates the fourth and sixth moments of the probability distribution of the end-to-end vector of a polymer chain, close to the critical dimensionality 4. The results support that the excluded volume interactions do not change the Gaussian structure of the probability for large distances. Depending on the value of the excluded volume parameter u', an expansion or a shrinkage to this probability occurs even for the dimensionality 4. (7 refs.)

100616 Molecular dimensions by neutron scattering. R.Ullman (Ford Motor Co., Dearborn, MI, USA).
J. Polym. Sci. Polym. Lett. Ed. (USA), vol.21, no.7, p.521-6 (July 1983).
The scattering from an assembly of randomly arranged polymer molecules varies with wave vector according to $I(q)=AMcS(q)\approx AMc(1-q^2R_g{}^2/3)+$terms of order q^4 where q, the magnitude of the wave vector, is equal to $(4\pi/\lambda)\sin(\theta/2)$; λ is the wavelength; and θ is the scattering angle. The polymer molecular weight is M, c is concentration, and A is a lumped constant containing a contrast factor, detector efficiency, and a variety of other parameters. R_g is the radius of gyration, obtained from the slope-to-intercept ratio of the $[I(q)]^{-1}$vs. q^2 plot. Unfortunately, in many neutron scattering experiments, measurements are not carried out at sufficiently low values of qR_g, and therefore both experimental slopes and experimental intercepts can be in error. To estimate these errors and to provide possible correction factors, the author has carried out calculations for three model systems: Gaussian coils, rods, and spheres. (4 refs.)

100617 Polyimides. II. Effect of structure on properties of polyimides. I.K.Varma, B.S.Rao (Indian Inst. of Technol., New Delhi, India).
J. Polym. Sci. Polym. Lett. Ed. (USA), vol.21, no.7, p.545-50 (July 1983).
Condensation polyimides based on 3,3′,4,4′-benzophenone tetracarboxylic acid dianhydride (BTDA) and several diamines have been investigated extensively as adhesives. The effect of molecular weight on the thermal stability of polyi-

mides derived from BTDA and 4,4′-diaminodiphenylether has been described in the literature. St. Clair, St. Clair, and Smith (1977) have reported the solubility studies of homopolymers of BTDA with 4,4′-diaminodiphenylether and m- or p-phenylene diamine. The purpose of the the authors' investigations was to evaluate the effect of isomeric changes in the molecular structure of these polyimides on thermal behaviour and adhesive properties. The systems selected to study the effect of positional isomerism on properties of condensation polyimides were based on BTDA and m-phenylene diamine (M), p-phenylene diamine (P), and 4,4′-diaminodiphenylether (E). Six copolyimides were prepared by taking 1:2, 1:1, and 2:1 molar ratios of E/M and P/M. (11 refs.)

100618 Small-angle X-ray scattering techniques—investigation of macromolecular structures. N.C.Sahu, S.C.Das (Dept. of Phys., Regional Engng. Coll., Rourkela, India).
J. Opt. (India), vol.12, no.1, p.12-18 (Jan.-March 1983).
Small angle X-ray scattering (SAXRS) techniques are employed to investigate structure of macromolecules. The theory is simple involving an inverse relationship between the particle dimensions and the scattering angle. The instrument however is sophisticated yielding high resolution. A Kratky Camera of the latest design was used. The authors use Kratky and Porod to investigate the pore structure of giant molecules of cellulose in Jute, and Babinet's reciprocal relationship is considered. Instrumental techniques are also discussed. (18 refs.)

100619 Effects of protonation on the conformational characteristics and geometry of the rod-like benzobisoxazole polymers. W.J.Welsh (Dept. of Chem., Coll. of Mount St. Joseph, Mount St. Joseph, OH, USA), J.E.Mark.
Polym. Eng. & Sci. (USA), vol.23, no.3, p.140-3 (Feb. 1983). [received: July 1983]
Recent experiments on model compounds suggest that rodlike polybenzobisoxazole (PBO) and polybenzobisthiazole (PBT) chains are protonated when dissolved in highly acidic solvents. The PBO model compound can exist as a $2H^+$ ion, with one proton on each nitrogen atom, or (depending on the acidity of the medium) as a $4H^+$ ion, with two additional protons on the oxygen atoms. The PBT model compounds generally form $2H^+$ ions, owing to the lower basicity of sulfur atoms relative to oxygen atoms. In the present study, geometry-optimized CNDO/2 calculations have been carried out in an attempt to predict the effect of protonation on the conformational characteristics and geometry of PBO model compounds. Values of the conformational energy vs. rotation of the endphenylenes about the heterocyclic group are calculated for cis-PBO model compounds in the unprotonated form and as $2H^+$ and $4H^+$ ions. All three species prefer the coplanar conformation with maximum barriers, occurring at the perpendicular conformation, of approximately 8.4, 33.6, and 84.0 kJ mol^{-1} for the unprotonated form, the $2H^+$ ion, and the $4H^+$ ion, respectively. (23 refs.)

100620 Study of conformational elasticity of polymer chains by Monte Carlo method. P.G.Khalatur, B.N.Klyushnik, P.M.Pakhomov.
Vysokomol. Soedin. Ser. A (USSR), vol.25, no.7, p.1510-16 (July 1983). In Russian. English translation in: *Polym. Sci. USSR (GB)*
The process of stretching of PE chains with the number of units N=30-97 has been simulated using a computer. The elastic force f acting on the macromolecule end fixed on the r distance is calculated. For short unperturbed chains the various analytical approximations described the dependence of f on r are analysed. The best results are attained using expressions including $\langle r_0^s \rangle$ moments. For moderately stretched non-self-intersecting chains the f value is proportional to $(r/N)^{3/2}$. The average number of interunit contacts per unit is practically constant for small r and is decreased $\sim(1-r/N)$ for strongly stretched chains. (13 refs.)

100621 Study of conformational structure of macromolecules under stretching. Results of computer simulation and IR-spectroscopy. P.G.Khalatur, P.M.Pakhomov, B.N.Klyushnik.
Vysokomol. Soedin. Ser. A (USSR), vol.25, no.7, p.1517-24 (July 1983). In Russian. English translation in: *Polym. Sci. USSR (GB)*
The process of stretching of PE chains has been studied by Monte Carlo methods and IR spectroscopy. In simulation the chemical structure of the chain, retardation and paired mutual dependence of internal rotations, volume interactions are taken into account. The change of conformational composition and orientation of chain elements towards the stretching axis is studied. The comparison of calculated and experimental data shows the satisfactory correlation in the change of content of various conformers and their orientation for not very high degrees of stretching ($\lambda \leq 3$-4). The reasons of discrepancies at large λ values are discussed. (13 refs.)

36.40 ATOMIC AND MOLECULAR CLUSTERS

100622 Photoionization measurements on isolated iron-atom clusters. E.A.Rohlfing, D.M.Cox, A.Kaldor (Corporate Res. Sci. Lab., Exxon Res. & Engng. Co., Linden, NJ, USA).
Chem. Phys. Lett. (Netherlands), vol.99, no.2, p.161-6 (29 July 1983).
Laser vaporization of a metal substrate within a pulsed supersonic nozzle is used to generate beams of iron-atom clusters, Fe_x, x=2-25, which are detected by laser photoionization and time-of-flight mass spectrometry. By examining the dependence of the Fe_x^+ signal on ionizing laser intensity and frequency, the authors have been able to roughly determine the ionization potentials (IPs) of the isolated iron clusters. Oscillations in the curve of IP versus cluster size are observed. (17 refs.)

100623 Quasiresonant excitation transfer in molecular aggregates. R.P.Parson, R.Kopelman (Dept. of Chem., Univ. of Michigan, Ann Arbor, MI, USA).
J. Chem. Phys. (USA), vol.79, no.3, p.1444-51 (1 Aug. 1983).
Excitation transfer in finite molecular aggregates is analyzed in the context of the Haken-Strobl model (1973). Explicit solutions are presented for a trimer and a rectangular tetramer. Special emphasis is placed upon population transfer among subunits (monomers, dimers) and its relationship to energy transfer, and upon the problems associated with coherence of this transfer process. These aggregates serve as models for the problem of excitation transfer in disordered media, where partial coherence resulting from short-range interactions has been largely ignored. The authors' most intriguing result is the greatly diminished effectiveness of the longer-ranged transfer in the presence of short-range clusters. Under some conditions the ensuing energetic mismatches may well dominate the overall energy transport and render invalid the usual description in terms of hopping among individual sites. An application to triplet energy transport in isotopic mixed naphthalene crystals is given; it is seen that the reduced efficiency of non-nearest-neighbor transfer processes reinforces the two-dimensional characteristics of the energy transport. (14 refs.)

100624 Ab initio orbital calculations on clusters of methyl fluoride. T.Oi, E.Sekreta, T.Ishida (Dept. of Chem., State Univ. of New York, Stony Brook, NY, USA).
J. Phys. Chem. (USA), vol.87, no.13, p.2323-9 (23 June 1983).
Various two-, and three-, and four-membered clusters of methyl fluoride have been studied by means of the Gaussian-70 program using the minimal STO-3G and the 4-31G basis sets. Results obtained by using the STO-3G set are more consistent with experimental results than those obtained by using the 4-31G set. The optimum C-F...H-C configuration in all clusters investigated is as follows: R_{HF}=2.1 Å, FHC angle=180°C, CFH angle=120-125°. The optimum STO-3G stabilization energies obtained for the three cluster sizes correspond to the following: −0.78, −0.82, and −0.83, in kcal/mol of F...H-C interaction, for the two-, three-, and four-membered clusters, respectively; and −0.39, −0.82, and −0.83, in kcal/mol of monomer, for the two-, three-, and four-membered systems, respectively. 100625 The cylindrical Poisson-Boltzmann equation. I. Transformations and general solutions. C.J.Benham (Dept. of Math., Univ. of Kentucky, Lexington, KY, USA).
J. Chem. Phys. (USA), vol.79, no.4, p.1969-73 (15 Aug. 1983).
In the paper the cylindrical Poisson-Boltzmann equation in reduced coordinates is transformed into an algebraically nonlinear second order ordinary differential equation, which is a particular case of Painleve's third equation. The only singularities of solutions to this equation are movable poles of second order. Series expansions are developed which express the general solution locally about points of analyticity and about a pole. Back transformation yields local solutions to the cylindrical Poisson-Boltzmann equation. The solutions throughout an interval generally require analytic continuation of these local expressions. In addition to developing exact solutions, asymptotic properties are anlayzed for the case of an isolated cylindrical polyelectrolyte. Further, an alternative technique of solution is sketched in which the cylindrical Poisson-Boltzmann equation is transformed into the sine-Gordon equation, which may then be solved by standard methods to give a one parameter family of solutions. A bibliography of references to the third Painleve equation is presented. The application of these results to the analysis of the theoretical behavior of cylindrical polyelectrolytes in ionic solutions will be presented in a subsequent contribution. (29 refs.)

100626 An analytic solution for the potential due to a circular parallel plate capacitor. W.J.Atkinson (Dept. of Radiation Oncology, Univ. of Alabama, Birmingham, AL, USA), J.H.Young, I.A.Brezovich.
J. Phys. A (GB), vol.16, no.12, p.2837-41 (21 Aug. 1983).
An analytic solution is given for the potential due to a capacitor consiting of two coaxial circular discs with equal radii and of infinitesimal thickness. The potential is expressed as a rapidly converging infinite series which can be readily evaluated. The utility of the expression is illustrated by two examples in which the potential has been computed. (11 refs.)

100627 Attenuation of low frequency fields by conducting ellipsoidal shells. F.L.Curzon, D.A.Parfeniuk (Phys. Dept., Univ. of British Columbia, Vancouver, BC, Canada).
Can. J. Phys. (Canada), vol.61, no.8, p.1260-9 (Aug. 1983).
The diffusion rate (λ, s^{-1}) of a spatially uniform, switched-on, field through a prolate spheroidal shell, has been related to the geometry of the shell, and orientation of the field with respect to it. The shell is assumed to be an isotropic ohmic conductor; the fields are described by Poisson's equation. For a spatially uniform alternating field (frequency ω), the attenuated field inside the shell is shown to be a function of λ/ω; the smaller this ratio, the lower the attenuation. The computed results have been verified experimentally and by checking them against exact solutions which are available for limiting cases of the general problem. The results are relevant to the properties of an electric field meter whose sensor is a gas-filled glass bulb. The breakdown frequency of the gas depends on the field within it. (6 refs.)

100628 The nonlinear generation of a steady magnetic field in a conducting sphere placed in an oscillatory magnetic field. W.N.Hugrass (School of Phys. Sci., Flinders Univ. of South Australia, Bedford Park, Australia).
J. Appl. Phys. (USA), vol.54, no.8, p.4280-4 (Aug. 1983).
It is shown that the nonlinear 'Hall' force generated in a conducting sphere placed in an oscillatory (AC) magnetic field has a nonzero curl. It therefore drives a poloidal current which has a steady (DC) component and a second harmonic component. A general analytic expression for the DC toroidal magnetic field generated by the Hall current is obtained for the weakly nonlinear case: $\omega_{ce}/\nu \ll 1$, where $\omega_{ce}=eB/m$ is the electron cyclotron frequency in the AC magnetic field and ν is the effective collision frequency. The DC magnetic field is evaluated numerically (using the general analytic formulae) for the special case where the applied AC magnetic field is uniform. (10 refs.)

100629 Compact uniform field electrode profiles [laser system applications]. G.J.Ernst (Dept. of Appl. Phys., Twente Univ. of Technol., Enschede, Netherlands).
Opt. Commun. (Netherlands), vol.47, no.1, p.47-51 (1 Aug. 1983).
By modification of the conformal transformation used by Chang in determining uniform field electrode profiles, a large improvement can be achieved in the uniformity of the electric field strength distribution over the surface of the electrodes. When such electrodes are used in a TEA laser system smaller electrodes can be used for the same gas discharge width. (3 refs.)

41.10H Electromagnetic waves: theory

100630 Mie scattering subroutines (DBMIE and MIEV0): a comparison of computational times. J.D.Felske, Z.Z.Chu, J.C.Ku (Dept. of Mech. & Aerospace Engng., State Univ. of New York, Amherst, NY, USA).
Appl. Opt. (USA), vol.22, no.15, p.2240-1 (1 Aug. 1983).
Although the theoretical description of the scattering of a planar electromagnetic wave by a homogeneous spherical particle has been known for some time, the ability to accurately compute the scattered field for particles of arbitrary size and refractive index is relatively recent. This is a result not only of the need for a digital computer but also of the fact that a simple straightforward programming of the theoretical result can lead to serious computational errors. Dave's (1968) DBMIE subroutine established a reliable numerical algorithm for performing such calculations. Most codes in use today possess Dave's algorithmic structure. Recently, Wiscombe (1979) developed a new set of Mie scattering codes (MIEV0 and MIEV1), which incorporate several advances in computational technique as well as some more efficient ways to organize the computation. The authors assess the effectiveness of these techniques by making a direct comparison of computational times of the DBMIE and the unvectorized MIEV0 subroutines using the same computing machine—a CDC Cyber 170/173 (single precision=14 decimal digits). (3 refs.)

100631 n-Fold polarization measures and associated thermodynamic entropy of N partially coherent pencils of radiation. R.Barakat (Div. of Appl. Sci., Harvard Univ., Cambridge, MA, USA).
Opt. Acta (GB), vol.30, no.8, p.1171-82 (Aug. 1983).
An n-fold ($n=2, \ldots, N$) measure of the degree of polarization associated with an $N \times N$ coherency matrix characterizing N pencils of radiation is discussed. The measure is cast in terms of the N possible scalar invariants of the coherency matrix and automatically takes into account possible rank deficiency. When $N=2$, the single polarization measure reduces to the usual expression for polarization as the fraction of the intensity contained in the polarized component. The $N=3$ case is discussed as an illustrative example, with special reference to the rank deficiency of a plane wave arbitrarily oriented with respect to the given coordinate system. Finally, these results are used to redevelop von Laue's theory of the thermodynamic entropy of partially coherent pencils of radiation. (17 refs.)

100632 Propagation of electromagnetic wave packets in nondispersive dielectric media. S.Bosanac (R. Boskovic Inst., Zagreb, Yugoslavia).
Phys. Rev. A (USA), vol.28, no.2, p.577-91 (Aug. 1983).
The speed of tunneling of the electromagnetic wave packets propagating in nondispersive dielectric media is analyzed on the basis of Maxwell's equations. It is shown that under certain conditions this speed can exceed the speed of light in vacuum. (15 refs.)

100633 Diffraction of plane electromagnetic wave by anisotropic spheroid. S.S.Oganesyan (Erevan Inst. of Nat. Economy, Erevan, USSR).
Radiophys. & Quantum Electron. (USA), vol.25, no.9, p.693-7 (Sept. 1982). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.25, no.9, p.971-6 (Sept. 1982).
Considers the scattering of a plane electromagnetic wave by an anisotropic oblong spheroid. The problem is solved by the method of vector harmonics. The cross section for scattering is calculated as a function of the anisotropy factor. (12 refs.)

100634 Three-dimensional problem of inverse scattering in stratified randomly inhomogeneous media. B.M.Shevtsov (Pacific Ocean Oceanological Inst., Acad. of Sci., USSR).
Radiophys. & Quantum Electron. (USA), vol.25, no.9, p.742-9 (Sept. 1982). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.25, no.9, p.1032-40 (Sept. 1982).
Inverse scattering upon the incidence of a wave packet on a half-space of a stratified randomly inhomogeneous medium is discussed on the basis of a nonlinear equation for the reflection coefficient. Expressions are obtained in general form for the average intensity of the backscattered field, which are compared by the example of an incident Gaussian wave packet with the results of radiative transfer theory, as well as with different forms of perturbation theory. The behavior of the higher moments of the intensity of the backscattered field is investigated. (8 refs.)

100635 Approximate solution of the problem of the coefficient of reflection from a layer of a one-dimensional randomly inhomogeneous medium. V.L.Brekhovskikh (Inst. of Atmospheric Phys., Acad. of Sci., USSR).
Radiophys. & Quantum Electron. (USA), vol.25, no.9, p.749-53 (Sept. 1982). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.25, no.9, p.1041-5 (Sept. 1982).
The problem of the reflection of a plane wave from an absorbing one-dimensional stochastic medium, the fluctuations of whose dielectric constant are represented in the form of a telegraphic random process, is considered. A simple formula is proposed for the probability distribution density of the reflection coefficient as a function of the layer thickness which is valid over a wide range of values of the parameters. (8 refs.)

100636 Excitation of an infinite periodic structure by a local harmonic source with an imprecisely known frequency. A.A.Bykov (Moscow State Univ., Moscow, USSR).
Radiophys. & Quantum Electron. (USA), vol.25, no.9, p.753-8 (Sept. 1982). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.25, no.9, p.1046-52 (Sept. 1982).
The excitation of an infinite periodic structure by a harmonic source is investigated. The distribution function of the modulus of the directivity function of the scattered field at a large distance from the source is plotted on the assumption that the frequency of the excitation field is a random variable with a specified distribution function. It is shown that if the distance from the source to the periodic structure is large in comparison with the period, the directivity distribution function is preferable to the directivity pattern for describing the scattered field, because the number of lobes of the latter grows without bound as the source is moved to infinity. (9 refs.)

100637 Electromagnetic field transformation upon change in properties of the medium with time within a limited region. V.V.Borisov (Leningrad State Univ., Leningrad, USSR).
Radiophys. & Quantum Electron. (USA), vol.25, no.9, p.759-64 (Sept. 1982). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.25, no.9, p.1053-9 (Sept. 1982).
A solution containing the transient process is constructed for differing time dependence of the initial field (unit Heaviside function, inclusion of harmonic oscillations). It is shown that the solution reduces to Lommel functions of two variables. It is found that with special choice of the initial field, a harmonic regime is established instantaneously in the wave exiting from a region with changing properties. (7 refs.)

100638 A study of statistical moments of shortwave fields, propagating in a medium with strong, Gaussian random inhomogeneities. The system of moment equations. N.A.Armand, V.N.Sekistov.
Radio Eng. & Electron. Phys. (USA), vol.27, no.10, p.1-6 (Oct. 1982). Translation of: *Radiotekh. & Elektron. (USSR)*, vol.27, no.10, p.1857-63 (Oct. 1982).
A new asymptotic method is developed which allows one to compute the statistical moments of the field of SHF waves, propagating in a medium with strong, Gaussian random inhomogeneities. (12 refs.)

100639 Fundamental electrodynamic relationships for nonperiodic processes in a linear nonstationary medium without dispersion. E.I.Krupitskiy.
Radio Eng. & Electron. Phys. (USA), vol.27, no.10, p.21-6 (Oct. 1982). Translation of: *Radiotekh. & Elektron. (USSR)*, vol.27, no.10, p.1881-7 (Oct. 1982).
The auxiliary quadratic relationships, the Umov-Poynting theory, the reciprocity relationship and the integral representations of vectors of nonperiodic fields are extended to the case of a linear, anisotropic and nonstationary medium without dispersion. (5 refs.)

100640 The shaping properties of zoned Fresnel lenses at millimeter wavelengths. G.A.Andreyev, O.V.Bazarskiy, A.I.Kolesnikov, Ya.L.Khlyavich.
Radio Eng. & Electron. Phys. (USA), vol.27, no.10, p.151-3 (Oct. 1982). Translation of: *Radiotekh. & Elektron. (USSR)*, vol.27, no.10, p.2027-30 (Oct. 1982).
These lenses decrease significantly the weight and the thermal losses below those encountered in ordinary dielectric lenses. At the same time the invariance of the product $\sqrt{\lambda} f$ of the ZFL (λ is the wavelength and f is the focal length), which causes the radiation from various Fresnel zones to be in phase when λ is varied, provides a constant impulse response and a constant spatial spectrum over a wide range of frequencies. The authors investigate the shaping properties of the ZFL at millimeter wavelengths for the paraxial and the nonparaxial cases. The radio images were formed by using a Fresnel lens with ten zones, constructed from organic glass. The lens has an apertures $D=400$ mm and a focal length $f=500$ mm at the frequency of 75 GHz. The SHF radiation in the frequency range from 40 to 80 GHz was provided by the generator G4-104. (5 refs.)

100641 On the scattering of an *E* polarized planar wave by a finite number of tapes located in one plane. N.V.Kvach, V.G.Sologub.
Radio Eng. & Electron. Phys. (USA), vol.27, no.10, p.154-6 (Oct. 1982). Translation of: *Radiotekh. & Elektron. (USSR)*, vol.27, no.10, p.2031-7 (Oct. 1982).
In this communication a method is extended to the case of the *E* polarization. Just as in the case of *H* polarization, the solution of the problem is determined by a function which (except for a constant multiplier) is the Fourier transform of the surface current density in the plane containing the metallic tape screens, which now satisfies a system of pairs or integral equations. (3 refs.)

100642 On the Abel transformation in the problem of diffraction by a thin strip. S.S.Vinogradov, Yu.A.Tuchkin, V.P.Shestopalov (Inst. of Radiophys. & Electronics, Acad. of Sci., Kharkov, Ukrainian SSR).
Sov. Phys.-Dokl. (USA), vol.27, no.11, p.916-18 (Nov. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.1-3, p.330-4 (Nov. 1982).
A method has previously been developed by Vinogradov (1978, 1980) for solving dual series equations which makes essential use of integral transformations with a kernel of Abel type. It is of interest to generalize this approach to the case of dual integral equations. The authors make such a generalization to the case of the dual integral equations arising in the classical problem of diffraction by a thin strip. The connection of the present method with other approaches is also discussed. (9 refs.)

100643 Eigenwaves in an inhomogeneous azimuthally bigyrotropic medium. V.A.Mescheryakov, A.E.Mudrov, G.A.Red'kin (V.D. Kuznetsov Physicotech. Inst., Tomsk State Univ., Tomsk, USSR).
Sov. Phys. J. (USA), vol.25, no.11, p.1015-18 (Nov. 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.11, p.46-9 (Nov. 1982).
The problem of natural electromagnetic waves in an azimuthally magnetized bigyrotropic medium which is inhomogeneous in the radial direction is solved analytically. A system of generalized wave equations is obtained in the longitudinal components of the electrical and magnetic fields. Particular solutions

of the system are represented in the form of generalized power series. The series exponents are determined and recursion formulas are built up for calculating their coefficients. The passage to particular cases of a homogeneous gyrotropic and inhomogeneous isotropic medium is realized, and the results are compared with known data from the literature. (6 refs.)

100644 A characterization of the range of the divergent beam X-ray transform. D.V.Finch, D.C.Solmon (Dept. of Math., Oregon State Univ., Corvallis, OR, USA).
SIAM J. Math. Anal. (USA), vol.14, no.4, p.767-71 (July 1983).
The authors give a characterization of the range of the divergent beam X-ray transform when the source set is a sphere. The result is analogous to the theorem of Helgason (1965) and Ludwig (1966) on the range of the Radon transform. (11 refs.)

100645 Adiabatic invariant and evolution equations for the motion of a particle in a strongly inhomogeneous magnetic field. K.Sh.Khodzhaev, A.G.Chirkov, S.D.Shatalov (Leningrad Polytech. Inst., Leningrad, USSR).
Radiophys. & Quantum Electron. (USA), vol.25, no.9, p.703-10 (Sept. 1982). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.25, no.9, p.983-91 (Sept. 1982).
Considers a new example of motions of a charged particle in electric and magnetic fields which can be studied by an asymptotic method (the electric field is not assumed to be weak and the magnetic field is assumed to be weakly inhomogeneous). In the present case the authors find the adiabatic invariant which depends on all values of the magnetic field intensity along the trajectory loop. In the first approximation they obtain the Hamiltonian structure of the evolution equations. The motion is analyzed by using the obtained evolution equations and adiabatic invariant. (9 refs.)

100646 Characteristics of the formation of an electromagnetic wave field with an instantaneous change in the states of charges. V.L.Kon'kov, G.P.Novikova (Gorki Res. Inst. of Phys. & Technol., N.I. Lobachevskii State Univ., Gorki, USSR).
Sov. Phys. J. (USA), vol.25, no.11, p.1057-9 (Nov. 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.11, p.93-5 (Nov. 1982).
It is shown that in the process of annihilation and neutralization of two moving charges of opposite sign, energy is not radiated at the instant of the disappearance of the charges, but is formed later from the energy of the magnetic fields of the disappearing charges, i.e. a reaction effect occurs. An analogous effect will also occur in other radiation processes such as the instantaneous starting and stopping of charges, their instantaneous creation and the electrification of bodies, etc. The existence of the reaction effect in the radiation of electromagnetic energy by charges seems to be an essential defect in macroscopic electrodynamics. 100651 Use of axially symmetric electrostatic fields for ion beam focusing. E.Colton (Phys. Div., Argonne Nat. Lab., Argonne, IL, USA), J.C.Kelly.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2734-6 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The 1/r electric field obtained between charged coaxial cylindrical electrodes is useful for focusing hollow ion beams in ion microprobe and ion implantation applications. The focusing strengths are mass independent at nonrelativistic energies. Focused particle densities can be enhanced by using a diverging-converging pair to flatten the dependence of focal length on incoming beam radius. Transport of 425 keV and 1 MeV protons has been simulated and results are presented. (4 refs.)

41.90 OTHER TOPICS IN ELECTRICITY AND MAGNETISM

100652 Is magnetic flux quantized in a toroidal ferromagnet?. A.Tonomura, H.Umezaki, T.Matsuda, N.Osakabe, J.Endo, Y.Sugita (Central Res. Lab., Hitachi Ltd., Tokyo, Japan).
Phys. Rev. Lett. (USA), vol.51, no.5, p.331-4 (1 Aug. 1983).
Total magnetic flux trapped in a tiny toroidal magnet is measured by an electron holography technique to test predicted flux quantization. The experimental results show that the magnetic flux is quantized neither by h/e units nor by $h/2e$ units. This fact provides further evidence for the existence of the Aharonov-Bohm effect. (10 refs.)

42.00 OPTICS

100653 New aspects of Huygens principle. J.Tabin (Inst. of Phys., Tech. Univ., Gliwice, Poland).
Appl. Phys. B (Germany), vol.B31, no.4, p.225-8 (Aug. 1983).
In the case of two-dimensional problems the vector field determined by Huygens' integral and its derivatives of the first and second order are continuous in the space including the surface of integration except edges and corners. In many applications, however, the determined potential, its normal derivative and those presumed by Helmholtz's formulation differ essentially. A procedure partially analytical and partially numerical is described yielding a field more exactly satisfying the presumptions. (6 refs.)

42.10 PROPAGATION AND TRANSMISSION IN HOMOGENEOUS MEDIA

100654 Scattering from a V-shaped groove in the resonance domain. G.S.White, J.F.Marchiando (US NBS, Washington, DC, USA).
Appl. Opt. (USA), vol.22, no.15, p.2308-12 (1 Aug. 1983).
Radiation scattered from a *V*-shaped groove in the resonance domain was measured and compared to predictions from a rigorous theory. The calculated scattering accurately predicted the number of peaks and general shape of the observed scattering. Small variations in groove shape were found to alter peak heights noticeably and peak positions slightly. Finite beam size caused unavoidable discrepancies between calculated and measured scattering. (3 refs.)

100655 Selective reflection of light by helical piles of birefringent plates. G.Joly, N.Isaert (Lab. de Dynamique des Cristaux Moleculaires, CNRS, Villeneuve-d'Ascq, France).
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.15, p.1135-8 (25 April 1983). In French.
Helical piles of transparent plates with rectilinear birefringence, lightened in the direction of the screw axis, show two series of selective reflection domains. The piles studied experimentally reflect totally right handed circular vibrations for one series and left handed circular vibrations for the other. (11 refs.)

100656 Scattering from sinusoidal gratings: an evaluation of the Kirchhoff approximation. A.Wirgin (Lab. de Mecanique Theorique, Univ. de Paris VI, Paris, France).
J. Opt. Soc. Am. (USA), vol.73, no.8, p.1028-41 (Aug. 1983).
The Brekhovskikh variant of the Kirchhoff approximation (KA), as it applies to the description of the scattered field at large distances from a perfectly conducting sinusoidal grating (of amplitude h and period d) exposed to a plane wave of wavelength λ and incidence angle θ_i, is evaluated by means of energy-balance error calculations and comparisons with quasi-rigorous reference results obtained from the extensive form of the Rayleigh theory (RT). The RT is theoretically exact for all d/λ provided that $h/d \lesssim 0.072$ and can be made to yield accurate numerical solutions at all θ_i and for all polarizations roughly for $h/d < 0.39\text{-}0.0177\ (d/\lambda)$ when $d/\lambda \leq 15$. The KA is found to yield sufficiently accurate solutions at normal incidence not only for roughly $h/d < 0.011\ (d/\lambda)$. Furthermore, the quality of the KA diminishes rapidly with increasing angle of incidence, as is shown by the fact that unacceptable errors occur for $h/d \gtrsim 0.1$ above $\theta_i \simeq 6°$, for $h/d \gtrsim 0.05$ above $\theta_i \simeq 37°$, and for $h/d \gtrsim 0.016$ above $\theta_i \simeq 63°$ at the period/wavelength ratio of 10. At higher frequencies ($d/\lambda \simeq 36$) there is some improvement in that, for example, the error becomes excessive for $h/d \gtrsim 0.1$ only above $\theta_i \simeq 25.5°$. The KA proves to be unsafe at any frequency and incident angle as soon as h/d exceeds 0.13. This threshold is shown to be related to the onset of multiple scattering in the sense of geometrical optics. (62 refs.)

100657 Analysis of diffraction of an ellipsoidal wavefront. P.Rajagopala Rao (Electrical Engng. Dept., Baghdad Univ. of Technol., Baghdad, Iraq), M.M.Mahmoud, G.V.P.Rao.
J. Opt. (India), vol.12, no.1, p.8-11 (Jan.-March 1983).
Derives an expression from first principles for diffraction at an ellipsoidal wavefront. The diffraction of spherical and planar wavefronts are shown as specific cases from the same. The areas of Fresnel half period zones from the ellipsoidal wavefront are shown to be dependent on the ellipticity of the wavefront. (3 refs.)

100658 A note on wedge functions and echelette gratings. R.C.McPhedran (Dept. of Theoretical Phys., Univ. of Sydney, Sydney, Australia).
Opt. Acta (GB), vol.30, no.8, p.1029-34 (Aug. 1983).
The diffraction formalism of Jovicevic and Sesnic (see J. Opt. Soc. Am., vol.62, p.865, 1972) for echelette gratings has been the subject of much controversy. The authors outline how the formalism may be altered to make it rigorous. The cases of symmetric and asymmetric groove profiles are considered separately. In the latter situation, two separate modal expansions must be used in the groove region. (12 refs.)

100659 Comments on 'Determination of the absorption coefficient of thin absorbing films from measurements on the change of phase in transmission'. J.Casset (Dept. de Phys. du Solide, Univ. de Provence, Marseille, France).
Opt. Acta (GB), vol.30, no.8, p.1039-40 (Aug. 1983).
Comments on the paper by N. Barakat (see ibid., vol.29, p.1309, 1982) giving examples of similar methods used for particular cases. (6 refs.)

100660 Number of degrees of freedom in inverse diffraction. M.Bertero (Istituto Matematico l'Univ. di Genoa, Genoa, Italy), C.De Mol, F.Gori, L.Ronchi.
Opt. Acta (GB), vol.30, no.8, p.1051-65 (Aug. 1983).
The problem of inverse diffraction from plane to plane is considered in the case where a finite aperture exists in the boundary plane. Singular values and singular functions for the problem are introduced, and the number of degrees of freedom is defined in terms of the distribution of the singular values. Numerical computations are presented for the one-dimensional problem and it is shown that the effect of evanescent waves disappears at a distance of approximately one wavelength from the boundary plane, even when the dimension of the slit is comparable with the wavelength of the diffracted field. (16 refs.)

100661 The spatial coherence properties of Gaussian Schell-model beams. A.T.Friberg, R.J.Sudol (Dept. of Phys. & Astron., Univ. of Rochester, Rochester, NY, USA).
Opt. Acta (GB), vol.30, no.8, p.1075-97 (Aug. 1983).
The transverse and longitudinal spatial coherence properties of the light beams generated by planar Gaussian Schell-model sources are discussed. It is found that for all Gaussian Schell-model beams the ratio of the transverse coherence length to the beam width remains invariant upon propagation. An examination of the longitudinal coherence for both on-axis and off-axis pairs of points indicates that the longitudinal coherence will not, in general, die out as the separation between the points is increased. Rather, the degree of longitudinal coherence will approach a finite (non-zero) value as long as the source contains a finite coherence area, regardless of how small this area may be. Gaussian quasi-homogeneous beams are studied as a limiting case. The relation of the present work to the analysis of speckle size is briefly discussed. (33 refs.)

100662 Semiapertures quadrature. A.Magiera, L.Magiera (Inst. of Phys., Tech. Univ. of Wroclaw, Wroclaw, Poland).
Opt. Appl. (Poland), vol.13, no.1, p.91-100 (1983).
Contains the results obtained from the application of Hilbert transforms to present the diffraction patterns of the real semiapertures in analytical form with a quadrature component of the aperture function. The results have been compared with those obtained for amplitude-apodized optical systems. (4 refs.)

100663 A simple graphical method to determine the action of a system of retarders. S.Y.Keshavan (Dept. of Mech. Engng., Univ. of the West Indies, St. Augustine, Trinidad).
Strain (GB), vol.19, no.3, p.115-25 (Aug. 1983).
Graphical methods for the study of the transformation of polarised light are essentially pictorial representations of the changes in the polarisation of light as it passes through a system of polarisers and retarders. The analysis is common in both photoelasticity and crystallography. In the proposed method, knowing the characteristic parameters along a particular light path, a simple graphical method for determining the linear retarders which cause the variation of polarisation of light along the light path is illustrated. In a general loaded three dimensional photoelastic model, the characteristic parameters can be found at intervals along the light path. This graphical method makes use of the characteristic parameters and splits the light path into individual retarders which cause the combined effect for the light path. (6 refs.)

100664 On the structure of the diffraction field in the Fraunhofer zone. V.A.Zverev, T.P.Kosoburd, N.S.Stepanov (N.I. Lobachevski State Univ., Gorki, USSR).
Sov. Phys.-Dokl. (USA), vol.27, no.11, p.950-1 (Nov. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.1-3, p.604-6 (Nov. 1982).
Fraunhofer diffraction for planar objects is one of the classical divisions of wave optics. A rectangular structure, even if it is contained in the transparency, is not preserved in the diffraction pattern. With increasing angle of inclination there is a tendency for the appearance of axial symmetry (with the symmetry axis y_1 corresponding to the line of intersection of the plane of incidence and the transparency itself). (4 refs.)

100665 Calculation of the parameters of a laser beam transmitted by a focusing rod. A.A.Kuznetsov, A.B.Tsibulya (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.2, p.243-5 (Feb. 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.2, p.430-2 (Feb. 1983).
Expressions are derived for relating the parameters of a laser beam at the entry and exit of a focusing rod with a parabolic refractive index profile. The derivation is made by using the framework of paraxial geometric optics and by modeling a laser beam by a ray packet equivalent in result to the Kogelnik model. (4 refs.)

42.20 PROPAGATION AND TRANSMISSION IN INHOMOGENEOUS MEDIA

100666 Theoretical and experimental investigations of light scattered from a rotating ground glass. V.Harwalkar, H.Bohidar, S.Chopra (Phys. Dept., Indian Inst. of Technol., New Delhi, India).
Appl. Phys. B (Germany), vol.B31, no.4, p.215-20 (Aug. 1983).
The authors report on a theoretical analysis and experimental observations on the statistical properties of light scattered from a rotating ground glass using a multichannel analyser based photon correlator system. Analysis of data indicates that the linewidth of scattered radiation depends on the scattering angle, which contradicts evidence presented earlier by Estes et al. (1971) and others. (4 refs.)

100667 Photon correlation spectroscopy of polydisperse samples. I. Histogram method with exponential sampling. G.C.Fletcher, D.J.Ramsay (School of Math. & Phys., Macquarie Univ., North Ryde, Sydney, New South Wales, Australia).
Opt. Acta (GB), vol.30, no.8, p.1183-96 (Aug. 1983).
The method of cumulants for analysing data from polydisperse solutions of scatterers works well for fairly narrow distributions of particle radii. With broader distributions cumulants analysis is less successful, largely because of truncation errors in the series expansions. The authors have represented continuous broad distributions of decay rates by exponentially spaced δ functions and histogram steps in order to compare these two approaches and to determine an optimal practical procedure. Different histograms, obtained by varying slightly the step positions, are 'overlaid' to obtain more detail in the recovered distribution function. Results of this procedure for analysing light-scattering data are presented for both synthetic data of known distribution function and also for real data from a polydisperse suspension of fat particles in milk. For the synthetic data the mean decay rate (and hence the mean particle size), polydispersity and skew of the distribution are recovered more effectively by the histogram method than by cumulant analysis. The distribution functions of decay rate are also converted to distribution functions of particle radius. (12 refs.)

42.30 OPTICAL INFORMATION, IMAGE FORMATION AND ANALYSIS

100668 Introduction to two-dimensional Fourier analysis. M.S.Rzeszotarski (Case Western Reserve Univ., Cleveland, OH, USA), F.L.Royer, G.C.Gilmore.
Behav. Res. Methods & Instrum. (USA), vol.15, no.2, p.308-18 (April 1983). (12th National Conference on the Use of On-Line Computers in Psychology, Minneapolis, MN, USA, 1982).
An introduction is given to some of the methods used in two-dimensional Fourier analysis and to two-dimensional image processing in general. (9 refs.)

100669 Pattern recognition. E.S.Gelsema.
Informatie (Netherlands), vol.25, no.6, p.58-64 (June 1983). In Dutch.
Pattern recognition by computer is concerned with the classification of perceived objects either from the nature and sequence of constituent elements syntactic pattern recognition or based on an analysis of statistical features (dimensions, surface structure, light reflection etc.). In everyday language the term 'picture processing' is used. The author presents a survey of the methodological background to 'picture processing' is used. The author presents a survey of the methodological background to 'picture processing' and statistical-analytical pattern recognition. (4 refs.) *R.S.*

100670 Focus-error operator and related special functions. J.Ojeda-Castaneda (Phys. Inst., Univ. Erlangen, Erlangen, Germany).
J. Opt. Soc. Am. (USA), vol.73, no.8, p.1042-7 (Aug. 1983).
The effect of focus error in image formation under coherent illumination is described in terms of a differential operator of exponential type. Fourier or Talbot images of periodic objects are described in terms of the eigenfunctions and the eigenvalues of this operator. The approach is also employed to generate special functions that indicate the influence of focus error on the point-spread function, the line-spread function, and the edge response. One set of functions is identified with Boivin's functions; the other seems to be new. Several properties of these functions (e.g. recurrence relations, power series, and differential equations) are given. (19 refs.)

100671 Critical issues in high-density magnetic and optical data storage. I. A.E.Bell (IBM Res. Div., San Jose, CA, USA).
Laser Focus (USA), vol.19, no.8, p.61-6 (Aug. 1983).
The storage of machine-readable information is of fundamental importance in today's highly complex and computer-oriented society. During the past thirty years, data storage has been synonymous with magnetic data storage, and enormous advances have been made in the performance of magnetic storage peripherals. Research and development into current configurations for optical data storage devices began in the late 1960s with early work on the read-only consumer videodisc, and this work has now advanced to a stage where optical disc data storage densities in the range 10^8-10^9 BPI have been demonstrated, i.e. well beyond current magnetic disc product densities. The author reviews and discusses the fundamental limits and identifies the key engineering issues that must be faced by each of these technologies as they evolve towards increasingly high density data storage. (16 refs.)

100672 Scale and rotation invariant real time optical correlator using computer generated hologram. Y.Saito, S.Komatsu, H.Ohzu (Dept. of Appl. Phys., Waseda Univ., Tokyo, Japan).
Opt. Commun. (Netherlands), vol.47, no.1, p.8-11 (1 Aug. 1983).
Scale and rotation invariant optical correlation is performed with a combination of the $\ln r-\theta$ coordinate transformation and the conventional optical matched filtering. The mask for the $\ln r-\theta$ coordinate transformation is made of the computer generated hologram whose transmission function is derived by the use of the stationary phase method. For the real time processing, a BSO incoherent-to-coherent device is placed on the coordinate transformed plane. (9 refs.)

100673 Fourier amplitude and Fourier phase in image sequences. Ch.Thum (Phys. Inst., Erlangen, Germany).
Opt. Commun. (Netherlands), vol.47, no.1, p.31-5 (1 Aug. 1983).
In an image sequence, the single images often look very similar except for shifts of one particular object. The author's investigations show that the Fourier amplitudes of the single images within an image sequence do not change very much, too. But the Fourier phases may change significantly. The author wants to make use of the almost-constancy of the Fourier amplitudes. As a consequence of this result, the author replaced the Fourier amplitude of every image in the sequence by the same estimate, and reconstructed every image from its correct Fourier phase and from the estimated Fourier amplitude. This concept can be used in transform coding, where one can achieve a data compression factor of about 1/2. (2 refs.)

100674 Grating coding for image subtraction with uneven bar widths. G.Rodriguez (Centro de Investigaciones en Optica AC, Mexico City, Mexico).
Opt. Lett. (USA), vol.8, no.8, p.455-7 (Aug. 1983).
A discussion is presented of the main features of grating coding when the encoder ruling has unequal widths in clear and dark bars. It is shown that the use of such a grating does not alter difference information. Alterations occur on the addition information. The validity of this analysis for the partially coherent case is shown. (8 refs.)

100675 Line-spread function relatively insensitive to defocus. J.Ojeda-Castaneda, L.R.Berriel-Valdos, E.L.Montes (Inst. Nacional de Astrofisica, Optica y Electronica, Puebla, Mexico).
Opt. Lett. (USA), vol.8, no.8, p.458-60 (Aug. 1983).
A new approach for obtaining line-spread functions (LSFs), which vary slowly in out-of-focus planes, is described. Based on this approach, the authors report a LSF that shows relatively less sensitivity to focus errors than that shown by both the diffraction-limited LSF and a LSF previously reported. (5 refs.)

100676 Pseudocolouring of directional structures by spatial frequency filtering. R.Nowak, M.Zajac (Inst. of Phys., Tech. Univ. of Wroclaw, Wroclaw, Poland).
Opt. Appl. (Poland), vol.13, no.1, p.39-46 (1983).
The results of pseudocolouring of the directional structures with the help of an optical setup for spatial frequency filtering with a quasipoint white light source and multicolour sectional spatial filter are presented. Apart from the test objects the examples of pseudocoloured biological and metallographic photomicrographs as well as aerial and satellite photographs are shown. (27 refs.)

100677 Apodization by a set of slits in one- and two-dimensional optical systems. A.Magiera (Inst. of Phys., Tech. Univ. of Wroclaw, Wroclaw, Poland).
Opt. Appl. (Poland), vol.13, no.1, p.73-91 (1983).
Previously (see ibid., vol.12, p.363, 1982) the influence of selected amplitude apodizers on the resolving power of a two-point image was analysed. The critical values of two-point resolution distance were determined when using the Rayleigh criterion. In this paper the intensity distributions of slits image obtained by using apodizers in an incoherent optical system are analysed as a supplement to the previous considerations. (2 refs.)

100678 Recognition of optical signals with polymodal probability distributions. V.I.Vorob'yev.
Telecommun. & Radio Eng. Part 2 (USA), vol.37, no.8, p.67-71 (Aug. 1982). Translation of: *Radiotekhnika, Moskva (USSR)*, vol.37, no.8, p.14-19 (Aug. 1982).
Estimation algorthms and the accuracy of estimates of the parameters of random, binary 'checkerboard' patterns, with application to the joint recognition of superimposed images of objects with a partial mutual shading, are considered. (4 refs.)

100679 Optimal multiple-parameter estimation in optical communications and quantum-mechanics—case of concentrated prior probabilities and finite dimensional Hilbert spaces. D.Ilic (Ilic Computers Corp. Inc., Santa Fe, CA, USA).
1983 IEEE International Symposium on Circuits and Systems, Newport Beach, CA, USA, 2-4 May 1983 (New York, USA: IEEE 1983), p.884-8 vol.2
An entirely new concept of minimum error variance quantum-mechanical estimation is developed for optical communications and quantum-mechanical applications. From the general results the author constructs the optimal quantum estimator for the case of concentrated prior probabilities and finite dimensional underlying Hilbert space. The quantum estimation problem treated is reduced to an equivalent unconstrained minimization problem of a real-valued polynomial functional of real variables which has the property that all local solutions are also global solutions. Consequently, the problem whose solution is beyond the comprehension of contemporary mathematics is reduced to a problem that is conceptually the simplest conceivable optimization problem. (1 ref.)

42.40 HOLOGRAPHY

(for acoustic holography, see 43.63)

100680 Survey of display hologram types. S.A.Benton (Res. Labs., Polaroid Corp., Cambridge, MA, USA).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.353, p.2-5 (1983). (Industrial and Commercial Applications of Holography, San Diego, CA, USA, 24-25 Aug. 1982).
Some characteristics of four principal types of display holograms are outlined in order to permit accurate identification and comparison by observers in the field. Several well-known non-holograms are also discussed. (15 refs.)

100681 New research in holographic pattern recognition. D.Casasent (Dept. of Electrical Engng., Carnegie-Mellon Univ., PA, USA).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.353, p.6-11 (1983). (Industrial and Commercial Applications of Holography, San Diego, CA, USA, 24-25 Aug. 1982).
The major use of holography in optical pattern recognition systems has been in matched spatial filter correlators. The author discusses new uses of holographic techniques in optical pattern recognition applications. These include: optical pattern recognition architectures of reduced size, weight and volume; optical pattern recognition architectures with reduced component tolerances; new nonlinear local optical preprocessing architectures; and optical pattern recognition systems that operate when geometrical and other differences are present in the input image. (20 refs.)

100682 Real time holographic interferometry with photorefractive Bi$_{12}$SiO$_{20}$ crystals. A.Marrakchi (Dept. of Electrical Engng., Univ. of Southern California, Los Angeles, CA, USA), J.P.Herriau, J.P.Highnard.
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.353, p.24-8 (1983). (Industrial and Commercial Applications of Holography, San Diego, CA, USA, 24-25 Aug. 1982).
The high sensitivity combined with the externally controlled spatial frequency response of photoconductive electrooptic $Bi_{12}SiO_{20}$ crystals (BSO) allow real-time nondestructive testing either by phase conjugation in the four-wave mixing configuration (FWM) or by energy transfer in two-wave mixing experiments (TWM). Applications to image amplification and mode pattern visualisation of a vibrating 3-D diffuse object is demonstrated. (12 refs.)

100683 Industrial applications of holographic testing. D.W.Nicholls (AiRes. Mfg. Co., St. Torrance, CA, USA).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.353, p.33-9 (1983). (Industrial and Commercial Applications of Holography, San Diego, CA, USA, 24-25 Aug. 1982).
Several applications of holographic testing are described together with the holographic methods used. Test subjects include components of gas turbine engines, cooling turbines, as well as statically loaded structures. Several typical examples are shown. (no refs.)

100684 Large aperture thermoplastic film computer driven holographic recording system. P.Meyrueis, C.Liegeois, F.Lamy, B.Ineichen (Louis Pasteur Univ., Strasbourg, France).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.353, p.40-6 (1983). (Industrial and Commercial Applications of Holography, San Diego, CA, USA, 24-25 Aug. 1982).
Describes a new opportunity in holographic industrial use with a large aperture thermoplastic film recording system. This system is computer-driven and can be synchronized with other stages in the holographic control. The system is designed and tested for use in an industrial context. (10 refs.)

100685 Hologram scanner design and fabrication in dichromated gelatin (DCG). R.Rallison, R.Lowe (Internat. Dichromate Corp., Draper, UT, USA).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.353, p.47-51 (1983). (Industrial and Commercial Applications of Holography, San Diego, CA, USA, 24-25 Aug. 1982).
Two major applications of holographic scanners are considered, the first is the code reader scanner now in use in supermarkets and soon to be used in automated warehousing. The second is the multipurpose line scanner currently used in line printers and soon to be included in automated inspection systems. Code reader facets perform multiple functions, each one deflects and focuses laser light at a unique angle and scans a short arc, the return light from a bar code is collimated by the same facet and is subsequently focused through a small aperture. Ambient light is diffracted at other angles and focused at points all around the aperture giving a high signal to noise ratio and the large height efficiency facets gather sufficient return light so that photodiodes and low power lasers can be used in the system. Line scanners can be made in a large variety of sizes and configurations inexpensively and with perfect fidelity, each one being a holographic replica of a master hologram. Focused arcs as well as parallel straight lines and even arbitrary computer generated scans are possible. The limitations and considerations of such devices are discussed along with design criteria related to fabrication problems and actual production line results. (3 refs.)

100686 Use of holographic optical elements as beam splitters in holography of weakly moving objects. E.S.Ebied, D.Courjon, J.Bulabois (Lab. de Phys. Generale et Optique, Faculte des Sci. et des Tech., Besancon, France).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.353, p.52-60 (1983). (Industrial and Commercial Applications of Holography, San Diego, CA, USA, 24-25 Aug. 1982).
The necessity of perfect stability of the object during the holographic recording step is one of the chief problems which limits the use and the development of such an optical coding technique. The authors show that the quality of the reconstructed image depends upon several parameters, first of all the object motion, the structure of the object, the type of recording set-up, the nature of the coding and finally the linearity of the transfer intensity to density, in the hologram. Taking into account such different parameters, it is then possible to design holographic set-ups characterized by a relative insensitivity to motion and more generally to perturbations of the object during the recording step. The adopted device is based on imagery which ensures optical paths of equal lengths and on the use of holographic optical elements as beam splitters. Thanks to holographic beam splitters it is possible to modify the distribution of the object information in the hologram plane. Two holographic codings are studied: (i) a small hologram area codes one object point (point to point coding), (ii) a small hologram area codes the whole object information (object to point coding). Although the second coding gives a better result than the first in the case of a fixed object, the first one enables one to retrieve images of good quality even for object displacements of a few millimeters. The developed technique should be carried out in holographic microscopy of living cells. (7 refs.)

100687 Holographic concentrator insuring a chromatic dispersion on a photovoltaic cell array. N.Aebischer, C.Bainier, M.Guignard, D.Courjon (Lab. de Phys. Generale et Optique, Faculte des Sci. et des Tech., Besancon, France).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.353, p.61-7 (1983). (Industrial and Commercial Applications of Holography, San Diego, CA, USA, 24-25 Aug. 1982).
Presents a preliminary study and a prototype of a holographic solar concentrator where both focusing and dispersive properties of holographic optical elements are exploited. In such a concentrator, the image of the sun is chromatically dispersed and projected on a photovoltaic cell array; each cell corresponds to a specific band of the solar spectrum. This configuration insures the matching between the spectral response of the cells and the solar spectrum. Due to this matching, the photovoltaic cells can work in optimal conditions, that is, with maximum energy efficiency. The aim of this work is to underline the different problems and a perspective of such a realization. The problems are connected to chromatic aberrations, amplitude of dispersion, diffraction efficiency, stability in time, etc. (12 refs.)

100688 Ion-etching as a means of blazing and optimizing holographic diffraction gratings. J.M.Lerner (Instruments SA Inc., Metuchen, NJ, USA), J.Flamand, A.Thevenon.
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.353, p.68-71 (1983). (Industrial and Commercial Applications of Holography, San Diego, CA, USA, 24-25 Aug. 1982).
Holographic diffraction gratings, when used in a spectroscopic application, produce excellent image quality and stray-light rejection, but sometime lack optimum efficiency. Ion-etching through a sinusoidal photoresist groove into a glass substrate can produce triangular profiles comparable with the groove shape produced by classical diamond burnishing. This can be accomplished in both plano, spherical and aspheric substrates to produce gratings comparable in efficiency to classically ruled gratings. (10 refs.)

100689 Holographic nondestructive evaluation with on-line acquisition and processing. Y.Katzir, A.A.Friesem, I.Glaser, B.Sharon (Dept. of Electronics, Weizmann Inst. of Sci., Rehovot, Israel).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.353, p.74-81 (1983). (Industrial and Commercial Applications of Holography, San Diego, CA, USA, 24-25 Aug. 1982).
A holographic non-destructive evaluation (HNDE) system with on-line acquisition and processing of real-time interferograms is presented. The system comprises; photoconductor-thermoplastic recording materials, an image acquisition system based on a photodiode-array line scanner, a microprocessor for controlling acquisition and other system functions and a link to a large computer. The system is capable of fringe detection down to an accuracy of 1/100th of a fringe. Applications for the non-destructive evaluation of an actual industrial specimen, as well as mapping the derivatives of deformation of a 2-D object are presented. (7 refs.)

100690 Automatic computer analysis of double exposure hologram in industrial nondestructive control. F.Lamy, C.Liegeois, P.Meyrueis (Univ. Louis Pasteur, Strasbourg, France).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.353, p.82-9 (1983). (Industrial and Commercial Applications of Holography, San Diego, CA, USA, 24-25 Aug. 1982).
A software package based on symbolic form recognition algorithms has been established for holographic fringe characterization through a video camera. This program also includes sections for separating the inner defects from the outer ones in periodic structures. It has been tested successfully on cylindrical containers made of wired keolar on which all other non-holographic testing methods are inapplicable. (6 refs.)

100691 Nd:YAG holographic interferometer for aerodynamic research. J.E.Craig (Spectron Dev. Labs. Inc., Costa Mesa, CA, USA), G.Lee, W.D.Bachalo.
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.353, p.96-103 (1983). (Industrial and Commercial Applications of Holography, San Diego, CA, USA, 24-25 Aug. 1982).
A holographic interferometer system has been installed in the NASA Ames 2- by 2-Foot Transonic Wind Tunnel. The system incorporates a modern 10 pps, Nd:YAG pulsed laser which provides reliable operation and is easy to align. The spatial filtering requirements of the unstable resonator beam are described, as well as the integration of the system into the existing schlieren system. A two-plate holographic interferometer is used to reconstruct flow

field data. For static wind tunnel models, the single exposure holograms are recorded in the usual manner; however, for dynamic models such as oscillating airfoils, synchronous laser hologram recording is used. (12 refs.)

100692 Holographic measurement of particulate contamination in sealed sterile containers. J.C.Zeiss, J.Z.Knapp (R&D Engng. Dept., Schering Corp., Bloomfield, NJ, USA), J.S.Crane, P.Dunn, B.J.Thompson.
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.353, p.106-13 (1983). (Industrial and Commercial Applications of Holography, San Diego, CA, USA, 24-25 Aug. 1982).
The presence of particulates in injectable solutions can be medically hazardous depending on their size and shape. Hence, a mandatory particulate inspection is performed prior to the release of any injectable drug. However, the determination of realistic quality limits has been hampered by the absence of any physical non-destructive measurement or comparison technique. The authors describe a far-field holographic method for the measurement of particulate contamination in sealed sterile containers. This application of holography provides the pharmaceutical industry with a non-destructive technique to inspect production containers and to classify the size and quantity of contaminants. (12 refs.)

100693 Automatic evaluation of angular movements and linearity with holographical methods. M.Celaya, D.Tentori, C.Lopez, C.G.Lopez (Dept. of Centro de Investigacion Cientifica y de Educacion Superior, Appl. Phys., Ensenada, Mexico).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.353, p.114-20 (1983). (Industrial and Commercial Applications of Holography, San Diego, CA, USA, 24-25 Aug. 1982).
A real time holographic interferometer coupled to an automatic fringe analyzing system is presented to evaluate the linearity of the axial displacement of a translation stage. The basic holographic set up can separate the lateral from the longitudinal displacements and simplifies the fringe analysis. In plane rotation is identified by observing the nature of the variation of the fringe contrast with change in the viewing aperture stop. Tilt is identified and measured in the conventional manner that requires a simple modification (a change in the point of illumination) of the basic setup. The automatic fringe analyzing system identifies the center of a fringe as the midpoint between any two consecutive points of inflexion of the cosine density variation that may be ride on a variable dc bias due to noise and amplitude fluctuation in the reconstructed image. (4 refs.)

100694 Holography in Europe. H.Steinbichler (Lab. Hans Steinbichler, Endorf, Germany).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.353, p.138-49 (1983). (Industrial and Commercial Applications of Holography, San Diego, CA, USA, 24-25 Aug. 1982).
Holographic interferometry offers some essential advantages over other kinds of testing and measuring methods. Therefore this technology has arrived at such an advanced development stage that it is suited for use in the industrial manufacturing process. In composite materials holographic testing has already provided its worth. In addition to such pure material testing, vibration processes in structures and complete units can be investigated by holography. The methods described are verified by concrete examples. (16 refs.)

100695 Present state of holography in Japan. M.Suzuki (Dept. of Optical Instrument, Fuji Photo Optical Co., Ltd., Saitama, Japan), Y.Hayashi, Y.Yamamoto.
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.353, p.150-7 (1983). (Industrial and Commercial Applications of Holography, San Diego, CA, USA, 24-25 Aug. 1982).
Studies into the practical applications of holography started in universities and research institutions in Japan in the early 1960s. In addition, the development of a holographic system for practical use was facilitated by the cooperation of optical manufacturers with many university research laboratories. Since the first holographic system was sold on the market in 1979, the systems have found wide acceptance in the industrial field. Although the use of holography yields a wide variety of industrial applications, the most popular applications utilized at the present time in Japan are display generation and interferometry. (32 refs.)

100696 Display holography: a frontier of high resolution photography. N.J.Phillips (Dept. of Phys., Loughborough Univ. of Technol., Loughborough, England).
J. Photogr. Sci. (GB), vol.31, no.4, p.134-42 (July-Aug. 1983).
Since the invention of holography by Dennis Gabor (*c*.1948) and the invention of the laser in 1960, the field of display holography has seen great advances. The early promise of the modern work in the early 1960s was clearly blocked by a lack of understanding of basic photographic science. More recent work based on a better understanding of photographic chemistry has at least revealed many of the obvious problem areas. The author seeks to outline the important holographic imagery regimes, to offer an understanding of how each depends on specific photographic manipulative methods as far as chemistry is concerned, and how they interrelate with the special photographic materials in the recording process. (18 refs.)

100697 Holographic phase aberration balancing with an inexpensive liquid gate. V.G.Kulkarni, D.Sen (Stand. Div., Nat. Phys. Lab., New Delhi, India).
J. Opt. (India), vol.12, no.1, p.1-5 (Jan.-March 1983).
A method of constructing a liquid gate of good optical quality by using inexpensive glass sheets as windows is described. Experimental results are presented to demonstrate the performance of the liquid gate. Such a liquid gate is useful for production of correction holograms for optical imaging and optical data processing applications. (6 refs.)

100698 Possibilities of holographic separation of the useful signal. O.V.Angel'skii, V.K.Polyanskii.
J. Appl. Spectrosc. (USA), vol.37, no.4, p.1185-8 (Oct. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.4, p.636-40 (Oct. 1982).
Real media encountered in the path of beams taking part in the construction of images are unavoidably light-scattering. Scattering or radiation leads to the appearance of a background (reduction in contrast) in the observed image of the object. A comparative estimate of the effectiveness of the methods of 'averaging' and 'accumulating' holograms is made, and the optimum choice of geometry for recording holograms through scattering media is discussed. The case when a nonsteady medium (mist, haze) serves as the scatterer is considered. (8 refs.)

100699 Contrast enhancement in holographic moire fringes. P.K.Rastogi, P.Jacquot, L.Pflug (Swiss Federal Inst. of Technol. of Lausanne, Lausanne, Switzerland).
Opt. Acta (GB), vol.30, no.8, p.1067-74 (Aug. 1983).
Reports on the multiplicative holographic moire fringes in quasireal time. The work overcomes the drawback of low contrast fringes inherent to holographic moire patterns for the measurement of the in-plane displacements. The factors affecting the visibility of the fringes are discussed, and experimental results are presented. (22 refs.)

100700 Diffraction efficiency of blazed holographic gratings. L.Mashev, S.Tonchev (Inst. of Solid State Phys., Bulgarian Acad. of Sci., Sofia, Bulgaria).
Opt. Commun. (Netherlands), vol.47, no.1, p.5-7 (1 Aug. 1983).
The diffraction efficiency of blazed holographic gratings for the visible region was measured as a function of wavelength and angle of incidence for S and P polarization. (6 refs.)

100701 Spurious waves in thick phase gratings. J.W.Lewis, L.Solymar (Dept. of Engng. Sci., Oxford Univ., Oxford, England).
Opt. Commun. (Netherlands), vol.47, no.1, p.23-6 (1 Aug. 1983).
Phase gratings recorded sequentially by a reference wave and two object waves are studied with the aid of a coupled wave approach. It is shown that waves not participating in the recording process may be present with large amplitudes at replay when the two object waves are sufficiently close to each other. (3 refs.)

100702 Increasing the sensitivity of interference measurements. L.T.Mustafina, N.P.Kutikova.
Opt. & Spectrosc. (USA), vol.54, no.1, p.85-7 (Jan. 1983). Translation of: *Opt. & Spektrosk. (USSR)*, vol.54, no.1, p.149-52 (Jan. 1983).
It is shown that shearing interferometers can be used for simultaneous recording of holograms with symmetric orientation of the reference beam and for increasing the sensitivity of interference measurements. A method for additionally increasing the sensitivity of interference measurements is discussed wherein the reconstructing wave used is a wave reconstructed from the same hologram but having undergone a π phase shift. Experimental data are cited which confirm the feasibility of increasing the sensitivity of the measurements by more than an order of magnitude while leaving the quality of the interference fringes almost unaffected. (5 refs.)

100703 The use of a fibre-optic reference beam in a focused image holographic interferometer. D.M.Rowley (Dept. of Mech. Engng., Loughborough Univ. of Technol., Loughborough, England).
Opt. & Laser Technol. (GB), vol.15, no.4, p.194-8 (Aug. 1983).
Holographic interferograms recorded in the image plane of an optical system may be referenced by a beam transmitted through an incoherent fibre-optic bundle. In such a system the object to reference beam intensity ratio is noncritical, and path-length matching is easily achieved with commercial push fit connectors. Such an interferometer gives the user greater flexibility and can be used in a wide range of environments. (5 refs.)

100704 Preliminary results on underwater holography. J.Watson, P.W.Britton (School of Electronic & Electrical Engng., Robert Gordon's Inst. of Technol., Aberdeen, Scotland).
Opt. & Laser Technol. (GB), vol.15, no.4, p.215-16 (Aug. 1983).
The growth of the offshore oil and gas industries has created interest in performing optical holography underwater for purposes of inspection and archiving. An investigation is proceeding to establish the influence of a disturbing medium, such as water on holographic image quality and to determine the parameters required of an underwater holographic camera. Preliminary holograms have been produced, in the laboratory, of objects in water-filled tanks. Early indications of this work are that some of the prospective problems associated with underwater holography are likely to present constraints less severe than was first envisaged. (6 refs.)

100705 Digital and optical moire detection of flaws applied to holographic nondestructive testing. Xu Youren, C.M.Vest, E.J.Delp (Coll. of Engng., Univ. of Michigan, Ann Arbor, MI, USA).
Opt. Lett. (USA), vol.8, no.8, p.452-4 (Aug. 1983).
Superposition of two double-exposure holographic interferograms creates moire patterns that can be used to detect flaws. Relative magnification can be used to correct for imprecise replication of loading when the second interferogram is formed; it also can be used to detect flaws when only a single interferogram is used if the basic deformation field is radially symmetric. Digital image processing is a rapid and versatile technique for forming such moire patterns. (6 refs.)

100706 Single-wavelength coding of colour in one-step rainbow holography. E.Jagoszewski, H.Podbielska (Inst. of Phys., Tech. Univ. of Wroclaw, Wroclaw, Poland).
Opt. Appl. (Poland), vol.13, no.1, p.100-6 (1983).
The basic role in colour coding in rainbow holograms is played by the change in reconstructing beam direction with respect to those of reference beams used in recording of particular zones of the object in the hologram. The pseudocolouring method does not lead to exact reconstruction of natural object colour. It enables one however to code and next to reconstruct the image in the chosen colours. If the object is two-dimensional and focused by an optical system exactly in the recording medium plane, the reconstruction obtained is good, free of diffusion caused by dispersion, which is of particular importance in application of this method. (4 refs.)

100707 Estimate of the influence of secondary scattering on the diffraction efficiency of volume holograms of diffuse objects. A.P.Yakimovich (Inst. of Automation & Electrometry, Acad. of Sci., Novosibirsk, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.2, p.180-2 (Feb. 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.2, p.332-6 (Feb. 1983).
An analysis is made of the influence of secondary scattering of reconstructed waves on the diffraction efficiency of transmission and reflection holograms of diffuse objects. It is shown that such secondary scattering may be approximated by an exponential attenuation of the reconstructing and reconstructed waves in the interior of a hologram. The attenuation constant of this process is proportional to the angular dimensions of an object and inversely proportional to the hologram thickness. The dependences of the diffraction efficency on the modulation amplitude of holograms are obtained for different strengths of secondary scattering. (2 refs.)

42.50 QUANTUM OPTICS

100708 Photoinduced angular motion of states and field splitting of levels. A.G.Rudavets (Inst. of Automation & Electrometry, Acad. of Sci., USSR).
JETP Lett. (USA), vol.37, no.4, p.220-3 (20 Feb. 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.4, p.184-7 (20 Feb. 1983).
Wave equations are derived for the probability amplitudes for the angular motion of degenerate states of a resonant transition induced by elliptically polarized light. The spectrum of the field-induced splitting of levels is found by quantizing the azimuthal motion of quasiparticles described by these equations. (4 refs.)

100709 Superfluorescence pulse shape. I.R.Gabitov, V.E.Zakharov, A.V.Mikhailov (L.D. Landau Inst. of Theoretical Phys., Acad. of Sci., USSR).
JETP Lett. (USA), vol.37, no.5, p.279-82 (5 March 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.5, p.234-7 (5 March 1983).
It is shown that the superfluorescence pulse in a laser without mirrors has a universal self-similar shape, which is determined by a single parameter: the pulse delay time. (7 refs.)

100710 Superfluorescence in a cavity. R.Bonifacio, L.A.Lugiato (Istituto di Fisica dell Univ., Milan, Italy).
Opt. Commun. (Netherlands), vol.47, no.1, p.79-83 (1 Aug. 1983).
The authors analyze the superfluorescent emission from an extended atomic sample contained in a unidirectional ring cavity, such that the atomic linewidth is smaller than the cavity linewidth. This system is governed by a sine-Gordon-type equation which includes a linear loss term, with a suitable boundary condition. The authors show that the time evolution is well described by the mean field model, and discuss extensively the role of the cavity parameters, emphasizing the differences from superfluorescence in free space. (11 refs.)

100711 Observation of sub-Poissonian photon statistics. R.Short, L.Mandel (Dept. of Phys. & Astron., Univ. of Rochester, Rochester, NY, USA).
Phys. Rev. Lett. (USA), vol.51, no.5, p.384-7 (1 Aug. 1983).
The number of photons emitted in a short time interval by a single atom in the process of resonance fluorescence is measured, and it is shown that the probability distribution of this number is sub-Poissonian. (18 refs.)

100712 Photon interference and correlation effects produced by independent quantum sources. L.Mandel (Dept. of Phys. & Astron., Univ. of Rochester, Rochester, NY, USA).
Phys. Rev. A (USA), vol.28, no.2, p.929-43 (Aug. 1983).
Interference effects produced by independent quantum sources are investigated, when the state of the field is not describable as a simple mixture of coherent states. The results of classical and quantum-mechanical calculations are compared. Whereas correlation effects are predicted both classically and quantum mechanically when the sources have random phases, there are important differences when the number of atoms is small. In particular, when each source consists of just one atom, the joint probability of detecting two photons at two different points in the receiving plane is found to vanish when the distance between them is an odd number of half fringes. Finally it is shown that when the number of atoms of each source is subject to Poisson fluctuations, one recovers the solution given by classical optics for thermal light, no matter how weak the sources may be on the average. (23 refs.)

100713 Quantum noise in adaptive optical systems. II. V.I.Tatarskii (Inst. of Atmospheric Phys., Acad. of Sci., USSR).
Radiophys. & Quantum Electron. (USA), vol.25, no.9, p.731-42 (Sept. 1982). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.25, no.9, p.1018-31 (Sept. 1982).
For pt.I see ibid., vol.25, no.8, p.882 (1982). Considers the example of a random electromagnetic field of constant amplitude, with Gaussian phase fluctuations whose phase difference at two points can be measured using two photon counters. The authors compute conditional coherence functions for such a field, which correspond to the detection of some number of photons by these counters. It is shown that an adaptive optical system may be used to advantage no matter how weak the radiant flux. The statistical moments of the sine of the phase difference measured using two photon counters are analyzed. (4 refs.)

100714 Three non-degenerate wave processes. A.Hengeltraub, F.S.Dos Reis (Inst. de Fisica 'Gleb Wataghin', Univ. Estadual de Gampinas, Gampinas, Brazil).
Rev. Bras. Fis. (Brazil), vol.12, no.4, p.721-8 (Dec. 1982).
The authors have solved the Heisenberg equations of motion, for the creation operator of three independent optical modes, in a system described by a trilinear Hamiltonian. They did a unitary transformation that is equivalent to the short-time approximation when truncated in the second order. This rendered possible the calculation of the normal ordered characteristic functions of each of the three modes. (8 refs.)

100715 New results and analysis of the sequential optimization algorithm for multiparameter quantum estimation. D.Ilic (Dept. of Electrical Engng. & Computer Sci., Univ. of California, La Jolla, CA, USA).
24th Midwest Symposium on Circuits and Systems, Albuquerque, NM, USA, 29-30 June 1981 (North Hollywood. CA, USA: Western Periodicals 1981), p.154-8
Proposes an improved version of the quantum estimation method and proves that the proposed method leads to the solution of the best known problem of simultaneous quantum estimation of the parameters of a laser field at the aperture of a quantum optical receiver. Furthermore, the author demonstrates that the optimization functional is a coercive form. The analysis of the optimization constraints for the case of essentially bounded random variables is given. (10 refs.)

42.52 MASERS

100716 A classical electron-cyclotron maser with axial electron beam injection. J.L.Vomvoridis (Western Res. Corp., Arlington, VA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3124-6 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
It is shown that the Electron-Cyclotron Maser interaction can be made compatible with exclusively axial injection of the electron beam, by introducing an appropriate slow-wave structure. With an appropriate choice for the relevant parameters, the resulting interaction is found to be extremely efficient, with efficiencies approaching 100 percent, and to possess a moderate frequency upshift from the nonrelativistic gyrofrequency. The nonlinear theory of the interaction is outlined and preliminary designs are presented. (8 refs.)

100717 Demonstration of a two-stage backward-wave-oscillator free-electron laser. Y.Carmel, V.L.Granatstein, A.Gover (Naval Res. Lab., Washington, DC, USA).
Phys. Rev. Lett. (USA), vol.51, no.7, p.566-9 (15 Aug. 1983).
An experimental study of a two-stage millimeter-wave source in which the same intense relativistic electron beam first produces powerful (500 MW) radiation at 12.5 GHz and then uses that radiation as a 'pump' for a free-electron-laser interaction at frequency f>140 GHz is described. Implication for two-stage free-electron-laser experiments with reduced electron energy requirements are discussed. (21 refs.)

42.55 LASING PROCESSES

100718 Longitudinal voltage distribution in transverse RF discharge waveguide lasers. D.He, D.R.Hall (Dept. of Appl. Phys., Hull Univ., Hull, England).
J. Appl. Phys. (USA), vol.54, no.8, p.4367-73 (Aug. 1983).
The longitudinal variation in the voltage across a waveguide channel, excited by a transverse radio-frequency discharge has been analyzed in terms of simple transmission line theory. It is shown that the voltage variation follows a cosine curve for the waveguide structure in the absence of a discharge, and that this behavior is only slightly modified when a discharge is running. The voltage may exhibit variations of 30% for cases where the relevant waveguide length is only one tenth of the effective RF wavelength. However, it is shown that this variation may be reduced to below 5%, by the use of multiple feed points or by appropriate inductive termination of the line. Experimental results are in good agreement with theoretical predictions. (3 refs.)

100719 A solvable master equation for population inversion. W.M.Zheng (Ilya Prigogine Center for Studies in Statistical Mech., Univ. of Texas, Austin, TX, USA).
J. Phys. A (GB), vol.16, no.11, p.2497-500 (1 Aug. 1983).
The master equation derived for population inversion in a three-level model is solved exactly. The time-dependent behaviour of the process can then be discussed. (7 refs.)

100720 Dynamic symmetries in quantum electronics. F.T.Hioe (Dept. of Phys., St.John Fisher Coll., Rochester, NY, USA).
Phys. Rev. A (USA), vol.28, no.2, p.879-86 (Aug. 1983).
The author shows that two distinct realizations of the SU(3) symmetry—the Gell-Mann SU(3) symmetry in quark physics and the Elliott SU(3) symmetry in nuclear physics—can be applied to the same dynamical system in intense-field electrodynamics under different experimental conditions. The author also presents a set of simultaneous soliton solutions in the Elliott SU(3)-symmetry scheme which has not been derived previously. (25 refs.)

42.55B General theory of lasing action

100721 Rate equation theory of two-photon lasers. Lin Fucheng (Shanghai Inst. of Optics & Fine Mech., Acad. Sinica, Shanghai, China).
Chin. Phys. (USA), vol.3, no.2, p.450-8 (April-June 1983).
Two-photon lasers and laser amplifiers are studied by using the rate equations. The steady solution is obtained and its stability is analyzed. The time evolution of large deviation from the steady solution is studied by using computer simulation. The population inversion and the trigger input must exceed certain thresholds to operate a two-photon laser. The method for producing giant pulse is discussed. The possibility of building a practical two-photon laser is analyzed based on the known data. A Doppler-free two-photon laser needs much lower threshold but much more serious frequency matching among the atom system, cavity, and the trigger input. Such a Doppler-free two-photon laser could find applications in laser spectroscopy and in the accurate metrology. Two-photon laser amplifiers distort the input waveform seriously. This distortion depends strongly on the input intensity. (10 refs.)

100722 On the high power limit of the laser linewidth. A.Yariv, K.Vahala (California Inst. of Technol., Pasadena, CA, USA).
IEEE J. Quantum Electron. (USA), vol.QE-19, no.6, p.889-90 (June 1983). (8th IEEE International Semiconductor Laser Conference, Ottawa, Ont., Canada, 13-15 Sept. 1982).
The quantum mechanical limit of the laser linewidth is shown to imply a residual constant linewidth rather than obey an inverse power dependence as is usually assumed. (2 refs.)

100723 Correlation of radiation field and the translational motion of atoms in a single-mode laser. E.P.Gordov, G.A.Koganov, A.M.Khazanov (Inst. of Atmospheric Optics, Acad. of Sci., Tomsk, USSR).
Opt. Acta (GB), vol.30, no.8, p.1035-8 (Aug. 1983).
Considers a model of a single-mode laser based on two-level atoms having translational degrees of freedom. Correlation of the field and the atomic motion due to the recoil effect is taken into account. The self-consistent theory describing dynamic properties of the system is performed on the basis of semiclassical approximation. It is shown that due to the weak friction of resonant atoms in the buffer gas, their translational motion is strongly coupled with the radiation field. The field intensity and the momentum of atoms in the stationary state are calculated. The stationary momentum distribution is obtained and is shown to be far from an equilibrium distribution in the case of weak friction. (6 refs.)

100724 Self-pulsing and chaos in inhomogeneously broadened single mode lasers. R.Graham, Y.Cho (Fachbereich Phys., Univ. Essen, Essen, Germany).
Opt. Commun. (Netherlands), vol.47, no.1, p.52-6 (1 Aug. 1983).
Self-pulsing and chaos in inhomogeneously broadened single mode lasers is investigated in the framework of two models with 4 and 6 degrees of freedom, respectively. These models are derived as the first two steps of an infinite hierarchy of approximations of increasing sophistication. Numerical examples of self-pulsing and chaotic dynamics are presented.

100725 Directivity of the amplified spontaneous emission of active cylinders with end mirrors. G.N.Vinokurov, V.A.Gorbunov, V.I.Zhulin.
Opt. & Spectrosc. (USA), vol.54, no.1, p.82-4 (Jan. 1983). Translation of: *Opt. & Spektrosk. (USSR)*, vol.54, no.1, p.144-8 (Jan. 1983).
Radiation transport equations and balance equations for the population inversion are used to calculate the spatial characteristics of the amplified spontaneous emission and the steady-state population inversions for a uniformly pumped cylinder with end mirrors. A 3-*D* analysis of this problem leads in a natural way to the concept of a threshold pumping rate and makes it possible to distinguish between lasing and spontaneous emission. (9 refs.)

100726 Small-signal gain in lethargic and conventional laser amplifiers. F.A.Hopf, S.Stenholm (Optical Sci. Center, Univ. of Arizona, Tucson, AZ, USA).
Phys. Rev. A (USA), vol.28, no.2, p.1176-8 (Aug. 1983).
The lethargic regime of a swept-gain laser amplifier is investigated theoretically to determine the procedure for passing over to the conventional limit T_1(level lifetime) $\gg T_2$(phase memory time) of laser amplifiers. The calculation is done with a model in which the transit time of the atoms t_0, is less than T_1, which is soluble in closed form. The conventional limit is taken as $t_0 \rightarrow \infty$. The general and conventional limits involve contradictory conditions of operation; nonetheless, both agree with experiment. This apparent contradiction is resolved by the finding that the conventional limit is a singular case. (15 refs.)

Coherent radiation of electron bunches in free-electron lasers .... See Entry 100787

42.55D CO_2 lasers

100727 Operation of an inductively ballasted helical TE-CO_2 laser. D.J.Biswas, P.K.Bhadani, P.R.K.Rao, U.K.Chatterjee, A.K.Nath, U.Nundy (Bhabha Atomic Res. Centre, Bombay, India).
Appl. Phys. Lett. (USA), vol.43, no.3, p.224-5 (1 Aug. 1983).
The authors report here the successful operation of a Beaulieu-type TE-CO_2 laser using equalizing inductances. An improvement of 50% or more in the efficiency was observed over resistance-ballast system. (8 refs.)

100728 Investigation of the optical homogeneity of the active medium of an atmospheric-pressure electron-beam-controlled CO_2 laser during stimulated emission. S.A.Dimakov, L.N.Malakhov, V.E.Sherstobitov, V.P.Yashukov.
Sov. J. Quantum Electron. (USA), vol.13, no.2, p.221-4 (Feb. 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.2, p.397-402 (Feb. 1983).
An investigation was made of the optical homogeneity of the active medium of an electron-beam-controlled CO_2 laser at the moment of emission of a pulse. Inhomogeneities due to the dependence of the rate of thermal relaxation of the vibrational levels of the CO_2 molecules on the power of the laser radiation extracted from the excited region were observed experimentally. It was found that the resultant fluctuations of the refractive index at the edge of a laser beam amounted to 3×10^{-6}. It was also observed that when the structure of the radiation field was jagged, similar inhomogeneities could appear not only at the edge of a laser beam but throughout the active medium occupied by the radiation. (11 refs.)

100729 Calculation of the maximum output power of a continuous-flow CO_2 laser. V.A.Kuklin, Yu.E.Pol'skii (Aviation Inst., Kaza, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.2, p.236-8 (Feb. 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.2, p.420-2 (Feb. 1983).
It is shown that the relaxation losses in the resonator zone and the influence of the radiation field on a redistribution of the populations of the upper and lower active levels must be allowed for in the calculation of the maximum output power of a continuous-flow CO_2 laser. A system of equations is obtained for the description of the relaxation kinetics under the conditions of maximum output power. (5 refs.)

100730 Influence of the inhomogeneity of the process of energy deposition on the gain coefficient of high-power gas lasers. V.M.Baginskii, V.N.Gorshkov, A.I.Shchedrin (Inst. of Phys., Acad. of Sci., Kiev, Ukrainian SSR).
Sov. J. Quantum Electron. (USA), vol.13, no.2, p.238-40 (Feb. 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.2, p.423-5 (Feb. 1983).
A calculation is made of the distribution of the small-signal gain coefficient over a small aperture in a transverse section of a discharge chamber of a high-power CO_2 gas laser with a nonself-sustained discharge. It is shown that, in spite of a considerable inhomogeneity of the specific energy deposited in the discharge between the cathode and the anode, the gain coefficient of such systems can be practically constant for certain pump times. This equalization of the gain coefficient is due to an increase in temperature and a corresponding change in the relaxation constants in the region where the rate of energy deposition is high. (15 refs.)

100731 Determination of the rate constants used in design calculations relating to low-temperature CO_2-D_2 gasdynamic lasers. V.F.Gavrikov, A.P.Dronov, A.K.Piskunov, N.B.Rodionov.
Sov. J. Quantum Electron. (USA), vol.13, no.2, p.251-2 (Feb. 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.2, p.438-41 (Feb. 1983).
A comparison of the theoretical values of the gain coefficient with those found experimentally yielded the rate constants of the processes of near-resonant vibrational exchange between $CO_2(01^11)$ and $D_2(1)$ (1.59×10^3 Pa/sec), and of the vibrational-translational relaxation of $CO_2(00^01)$ ($2Pa^{-1}.sec^{-1}$) and of the bending mode of CO_2($4 \times 10^2 Pa^{-1}.sec^{-1}$) by interaction with deuterium. The temperature dependences of these constants were obtained in the range 100-800K. The variation of the vibrational mode temperatures along the nozzle was determined. (16 refs.)

42.55F Inert gas lasers

100732 He-Ne laser frequencies near 2.4 μm and their application to hydrogen fluoride detection. J.E.Eberhardt, A.W.Pryor (CSIRO, Lucas Heights Res. Labs., Sutherland, NSW, Australia).
IEEE J. Quantum Electron. (USA), vol.QE-19, no.6, p.891-3 (June 1983). (8th IEEE International Semiconductor Laser Conference, Ottawa, Ont., Canada, 13-15 Sept. 1982).
He-Ne lasers can provide three frequencies near 2.4 μm, one of which coincides with the $1R(5)$ frequency of HF at 4173.98 cm^{-1}. Either of the other frequencies may serve as a reference for absorbance measurements. One of these, at 4169.33 cm^{-1}, is a new lasing transition not previously observed ($4d_4'$-$3p_9$). Operating conditions are discussed. (17 refs.)

100733 Routes to chaotic emission in a CW He-Ne laser. C.O.Weiss, A.Godone, A.Olafsson (Phys. Tech. Bundesanstalt, Braunschweig, Germany).
Phys. Rev. A (USA), vol.28, no.2, p.892-5 (Aug. 1983).
Chaotic emission is observed from a 3.39-μm He-Ne laser. The authors find different sequences leading from coherent to chaotic states depending on the laser frequency. In particular, all three theoretically known sequences—'period doubling', 'Ruelle-Takens', and 'intermittency'—are observed. (12 refs.)

100734 Resonance phenomena, appearing in a He-Ne laser in the presence of discharge current modulation. V.V.Tuchin.
Radio Eng. & Electron. Phys. (USA), vol.27, no.10, p.110-13 (Oct. 1982). Translation of: *Radiotekh. & Elektron. (USSR)*, vol.27, no.10, p.1984-7 (Oct. 1982).
The results of experimental studies of the effect of low-frequency discharge current modulation on the radiation output power of a He-Ne laser with a wavelength $\lambda = 0.63$ μm are presented. It is found that for certain modulation frequencies a resonant increase of the DC component of the output power occurs (by a maximum of 10%). The short-term and long-term output power stabilities are investigated in the artificial striation excitation regime. (9 refs.)

100735 Amplitude characteristics of striations in the active elements of helium-neon lasers. Ya.A.Fofanov.
Radio Eng. & Electron. Phys. (USA), vol.27, no.10, p.113-19 (Oct. 1982). Translation of: *Radiotekh. & Elektron. (USSR)*, vol.27, no.10, p.1987-93 (Oct. 1982).
The suppression of striations in the active elements of He-Ne lasers by means of an external feedback via the spontaneous capillary emission is investigated. An equation is obtained that relates the amplitude of the striations to the gain and losses at the frequency of the striations in the system comprising the active element and external circuit. The results of experimental studies of the dependence of the amplitude of the striations on the relative excitation value are presented. (6 refs.)

100736 Mechanism of pulse emission from high-pressure electric-discharge He-Ar, He-Kr, and He-Xe infrared lasers. A.R.Sorokin (Inst. of Heat Phys., Acad. of Sci., Novosibirsk, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.2, p.165-72 (Feb. 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.2, p.308-18 (Feb. 1983).
A study was made of the time dependences of the amplitudes of stimulated and spontaneous emission from pulsed electric discharges in He-Ar, He-Kr, and He-Xe mixtures, and the processes involved in populating the active levels were analyzed. Direct and stepwise excitation by electrons was taken into account, as was population resulting from relaxation processes (collisions of the second kind with electrons, radiative cascades, recombination processes, collisions with atoms of the active and buffer gases, excitation transfer from the helium molecules). A qualitative picture was obtained of the characteristic processes for populating the atomic levels of Ar, Kr, and Xe as a function of the composition and pressure of the mixtures. It was established that the decisive mechanism at high presures involves direct excitation by electron impact from the ground states. (23 refs.)

100737 Laser action in xenon pumped by pulsed beams of runaway electrons. G.V.Kolbychev, E.A.Samyshkin (Inst. of Atmospheric Optics, Acad. of Sci., Tomsk, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.2, p.249-50 (Feb. 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.2, p.437-8 (Feb. 1983).
A report is given of the use of pulsed beams of runaway electrons for the pumping of gas lasers. Electron beams were generated inside a laser chamber. The average energy of these electrons was 1-4 keV. lasing was observed as a result of the $3d_2$-$2p_7$ transition in xenon. An analysis was made of the possibility of using runaway-electron beams in other types of gas laser. (2 refs.)

42.55H Lasing action in other gas lasers

100738 Lasing in CuCl+Na system. W.Winiarczyk (Inst. of Phys., Jagellonian Univ., Cracow, Poland).
Acta Phys. Pol. A (Poland), vol.A64, no.1, p.1235-7 (July 1983).
Preliminary results on using the CuCl+Na system as a medium for copper laser are presented. It is found that the Cu/(CuCl+NA) laser is similar to the Cu/CuCl laser, at least at temperatures lower than 550°C. The plasma processes leading to the creation of population inversion in cuprous chloride laser are not negatively affected by the addition of a low ionisation potential element like sodium. Similarly, the possible chemical reactions in Cu+Cl+Na system seem not to thwart the laser action. A similar experiment is now being prepared to find out whether the quenching of $^2D_{3/2}$ metastable level of atomic copper by potassium can increase the energy of the copper laser pulse. (7 refs.)

100739 Computer modelling of *e*-beam-pumped KrF lasers. C.B.Edwards, F.O'Neill (Rutherford Appleton Lab., SERC, Chilton, Didcot, England).
Laser & Part. Beams (GB), vol.1, pt.1, p.81-95 (Feb. 1983).
A computer kinetics model has been developed to predict the steady state behaviour of *e*-beam-pumped KrF lasers. The model can be used to calculate species densities, gain, loss and laser efficiency. Close agreement is obtained between the model predictions and a wide range of experimental measurements of optical gain, loss, and laser efficiency as a function of *e*-beam pump power, taken at various laboratories. (42 refs.)

100740 Vibrational relaxation and laser extraction in rare gas halide excimers. W.L.Morgan, N.W.Winter, K.C.Kulander (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA).
J. Appl. Phys. (USA), vol.54, no.8, p.4275-9 (Aug. 1983).
Recent experiments have demonstrated that the finite rate of vibrational relaxation in the formation of KrF affects the saturation characteristics of the KrF(B) state during extraction of laser light. The authors have assembled a collisional radiative model using calculated Einstein A coefficients for the lowest twenty KrF states and an approximate calculation of the rate of vibrational energy transfer between KrF and a buffer gas. The model describes the flow of excitation through the vibrational levels of KrF and demonstrates the effects of vibrational relaxation on KrF(B) saturation and spectra. The results of these calculations agree qualitatively with the published experimental results. In addition, the authors find that, due to the relaxation kinetics of KrF, Kr_2F, a major absorber, is not truly saturable. (10 refs.)

100741 Simple and efficient preionization system for gaseous lasers. A.D.Tavares,Jr., P.A.M.Dos Santos, C.A.Masone, A.A.Tagliaferri (Inst. of Phys., Univ. Federal Fluminense, Niteroi, Brazil).
Rev. Bras. Fis. (Brazil), vol.12, no.2, p.337-42 (June 1982).
A new preionization system for pulsed gas lasers was developed. It does not require special electronic circuits and has an extreme simplicity. The system was applied to an N_2 laser, and results are shown. (2 refs.)

100742 Optically pumped molecular laser utilizing C_2H_5Br and C_2H_5I halogen derivatives of ethane. V.A.Bugaev, E.P.Shilteris (Inst. of Radio Engng. & Electronics, Acad. of Sci., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.2, p.150-4 (Feb. 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.2, p.283-9 (Feb. 1983).
The observation of 15 lasing transitions in the 327.6-1059 μ range by pumping C_2H_5Br and C_2H_5I vapor with radiation from a low-pressure CO_2 laser is reported. The laser optoacoustic spectrum of the molecules and the absorption spectra are presented. The rotational quantum numbers J of the observed transitions are identified. (13 refs.)

100743 Investigaton of the power stability of a CW carbon monoxide laser. V.S.Aleinikov, V.I.Masychev, V.K.Sysoev (P.N. Lebedev Phys. Inst., Acad. of. Sci., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.2, p.224-8 (Feb. 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.2, p.402-7 (Feb. 1983).
The results are given of investigations of the output-power stability of a sealed CW carbon monoxide laser, simultaneously emitting as a result of a large number of cascade-coupled vibrational-rotational transitions. The investigations were carried out taking into account the spectral composition of the laser radiation after different degrees of monochromatization (with spectrally selective and broad-band optical resonators, a multimoding regime, and suppression of high-order modes). It was found that, despite the relatively large fluctuations in the output power of each of the laser transitions, the integrated laser output power of a multiresonance active medium and a broadband resonator showed only very small variations. A short discussion is given of the mechanism whereby the power fluctuations of the individual vibrational-rotational components are compensated in the integrated nonselected laser beam. Practical recommendations are given concerning the applications of CW carbon monoxide laser, with spectrally selective and nonselective optical resonators, in technology and in spectroscopic investigations. 100744 Chemical laser amplifier using a photon-branched reaction in an aerosol medium. V.I.Igoshin, S.Yu.Pichugin (P.N. Lebedev Phys. Inst., Acad. of Sci., Kuibyshev, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.2, p.267-9 (Feb. 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.2, p.458-61 (Feb. 1983).
An analysis is made of the possibility of a photon-branched process in a chemically active aerosol medium. The medium in question is that of a chemical DF-CO_2 laser in which disperse aluminum particles of definite concentration n and with an average of r_0 are injected. When this medium is subjected to infrared laser radiation aluminum is evaporated and interacts with fluorine to form free F atoms. It is shown that the proposed initiation method may be used to construct purely chemical pulsed amplifiers of coherent radiation with an energy gain 10-20. (6 refs.)

100745 Investigation of the threshold conditions for the generation of induced radiation by binary dye solutions. A.V.Aristov, D.A.Kozlovskii, M.B.Levin, A.S.Cherkasov.
J. Appl. Spectrosc. (USA), vol.37, no.4, p.1127-33 (Oct. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.4, p.569-76 (Oct. 1982).
The amplification cross section σ, which characterizes the induced radiative deactivation of excited molecules, practically coincides with the value determined from luminescence experiments. Therefore, the lasing and luminescence characteristics supplement each other as means for investigating the molecular parameters of laser media. This made it possible to determine certain kinetic and spectroscopic constants of intra- and intermolecular transitions in the generation of laser radiation. Of particular interest in this connection is research on multicomponent dye solutions for the purpose of clarifying the details of the conversion of the excitation energy into induced radiation in such system. The authors restrict their considerations to the case of binary solutions containing dyes with overlapping absorption and luminescence spectra. In such an active medium, the dye acceptor (Ac) with its greater wavelength can be excited not only directly by irradiation with pumping light but also by energy transfer from the molecules of a donor luminophor (Dn) with radiation of shorter wavelength. The spectral overlapping of the amplification bands of Dn and Ac implies their simultaneous participation in the induced radiation flux. The radiation parameters can be noticeably influenced also by an increase in the overall loss coefficient k_ν in the resonator (at the frequence ν) due to induced absorption (Dn) in the spectral range of laser-radiation generation. (29 refs.)

100746 Lasing and fluorescent characteristics of nine, new, flashlamp-pumpable, coumarin dyes in ethanol and ethanol:water. A.N.Fletcher, D.E.Bliss (Energy Chem. Branch, Naval Weapons Center, China Lake, CA, USA), J.M.Kauffman.
Opt. Commun. (Netherlands), vol.47, no.1, p.57-61 (1 Aug. 1983).
Improved flashlamp-pumped laser outputs and/or lifetimes are observed through the use of ethanol:water and the proper cover gas with many of nine new coumarin dyes. The new dyes are all rigidized and substituted in the 3-position. (11 refs.)

100747 Nature of the temperature effect on the lasing characteristics of dyes under laser excitation. V.M.Krasnoshchekov, A.B.Nikolaev, A.V.Aristov, A.S.Eremenko, S.M.Lankova, Yu.S.Lebedev, V.V.Rylkov.
Opt. & Spectrosc. (USA), vol.54, no.1, p.67-70 (Jan. 1983). Translation of: *Opt. & Spektrosk. (USSR)*, vol.54, no.1, p.118-22 (Jan. 1983).
The mechanism of the temperature effect on the lasing and spectral characteristics of solutions of rhodamine, oxazine, polymethine, and some other dyes is studied experimentally. An important role is established for the variation of concentration ratios with temperature of different types of dye in solution in shaping the lasing characteristics of dye-based active liquids. 100748 Carrier leakage and temperature dependence of InGaAsP lasers. T.R.Chen, B.Chang, L.C.Chiu, K.L.Yu, S.Margalit, A.Yariv (California Inst. of Technol., Pasadena, CA, USA).
Appl. Phys. Lett. (USA), vol.43, no.3, p.217-18 (1 Aug. 1983).
A direct measurement of electron and hole leakage in InGaAsP/InP lasers has been carried out. The effect of electron leakage on the temperature sensitivity of InGaAsP/InP lasers has been revealed. (6 refs.)

100749 Suppression of feedback-induced noise in short-cavity V-channeled substrate inner stripe lasers with self-oscillation. S.Matsui, H.Takiguchi, H.Hayashi, S.Yamamoto, S.Yano, T.Hijikata (Central Res. Labs., Sharp Corp., Nara, Japan).
Appl. Phys. Lett. (USA), vol.43, no.3, p.219-21 (1 Aug. 1983).
Self-oscillations of V-channeled substrate inner stripe (VSIS) lasers with index guiding and the influence of external feedback on low-frequency noise generation are presented. The self-oscillation is induced by means of shortening a cavity length of VSIS laser to 110 μm. VSIS lasers with self-oscillation have the fundamental linewidth of 0.56 Å below 3 mW and are not sensitive to both phase and amplitude of the externally reflected light. Signal to noise ratio of short-cavity VSIS laser at 1 MHz with a 10-kHz bandwidth was 97 dB at 0.05% optical feedback. (8 refs.)

100750 Streak camera study of short pulse generation in an optically pumped GaAs/(GaAl)As laser. M.D.Dawson, W.Sibbett, J.I.Vukusic (Blackett Lab., Imperial Coll., London, England), P.Dawson, G.Duggan, C.T.Foxon.
Appl. Phys. Lett. (USA), vol.43, no.3, p.226-8 (1 Aug. 1983).
A synchronously operated picosecond streak camera has been used in a direct time-resolved study of luminescence and laser emission from a GaAs/(GaAl)As double heterostructure laser pumped by <90 ps, 514-nm optical pulses from a mode-locked Ar ion laser. Semiconductor laser pulse widths down to 20 ps were recorded and the dependence of the temporal characteristics of these pulses on average pump power was investigated. (8 refs.)

100751 Anomalous longitudinal mode behavior of a deep Zn-diffused GaAs/GaAlAs laser. H.K.Choi, Shyh Wang (Dept. of Electrical Engng., Univ. of California, Berkeley, CA, USA).
Appl. Phys. Lett. (USA), vol.43, no.3, p.230-2 (1 Aug. 1983).
Observation of anomalous longitudinal mode behavior from deep Zn-diffused GaAs/GaAlAs lasers is reported. Single longitudinal mode operation is maintained without any mode hopping over a temperature range of more than 40°C when the current is fixed. The spectrum, however, is quite sensitive to current changes. (4 refs.)

100752 Effect of an active layer thickness on lateral and longitudinal modes of a gain guiding laser with a tapered stripe structure. T.Mamine (Semiconductor Res. Dept., Sony Corp., Atsugi-shi, Japan), H.Kawai.
Appl. Phys. Lett. (USA), vol.43, no.3, p.235-7 (1 Aug. 1983).
Effect of an active layer thickness on the lateral and longitudinal modes of the gain guiding laser with a tapered stripe structure has been studied. The authors observed broadening in the linewidth of each longitudinal mode as well as continuous emission spectra for the tapered stripe lasers with the thicker active layer of more than 0.1 μm. From the measurement of longitudinal as well as lateral modes, it is concluded that hole burning effect is enhanced in the thicker active layer as was pointed out by Copeland (1980). The experimental results observed for the tapered stripe lasers are inherent to gain guiding lasers with a stripe geometry structure. (9 refs.)

100753 Spontaneous emission into index-guided and gain-guided waveguide modes—a simple explanation [diode lasers]. G.Grau (Inst. fur Hochfrequenztech. und Quantenelektronik, Univ. Karlsruhe, Karlsruhe, Germany).
Arch. Elektron. & Uebertragungstech. (Germany), vol.37, no.7-8, p.280-1 (July-Aug. 1983).
The enhancement of spontaneous emission into gain-guided modes as compared with index-guided modes has been subject of some debate. A simple visualization existed before this debate; it is briefly described, because it leads to physical insight which might prove valuable in analogous problems. (5 refs.)

100754 Efficient backward and forward pumping CW Raman amplification for InGaAsP laser light in silica fibres. Y.Aoki, S.Kishida, H.Honmou, K.Washio, M.Sugimoto (Opto-Electronics Res. Labs., NEC Corp., Kawasaki, Japan).
Electron. Lett. (GB), vol.19, no.16, p.620-2 (4 Aug. 1983).
By pumping a small-core single-mode silica fibre with a 1.32 μm CW Nd:YAG laser, continuous-wave Raman amplification of InGaAsP laser diode light, with unsaturated gain as high as 21 dB, has been obtained in both backward as well as forward pumping configurations. (10 refs.)

100755 Influence of spectral hole burning on quaternary laser transients. M.J.E.Adams (British Telecom Res. Labs., Ipswich, England), M.Osinksi.
Electron. Lett. (GB), vol.19, no.16, p.627-8 (4 Aug. 1983).
Multimode rate equations including inhomogeneous gain saturation have been solved both numerically and by an analytic small-signal analysis. The results indicate that the principal effect of spectral hole-burning on transient behaviour is to reduce the damping time of relaxation oscillations. (11 refs.)

100756 Spectral characteristics of emission from stripe-geometry GaAs-GaAlAs double heterostructure lasers. Zhan Suzen (Yongchuan Photo-Electronics Res. Inst., China).
Chin. J. Lasers (Cina), vol.10, no.3, p.164-7 (20 March 1983). In Chinese.
Four types of emission spectra from stripe-geometry GaAs-GaAlAs double heterostructural lasers are described and their origin studied. It has been found that the multimode configuration is caused by the nonuniformity in the active region and its adjacent area. Mode shift and competition have been measured at different current levels. It has been noticed that wave lengths shift toward the shorter ones with an increase of current. The experimental results for devices with higher thermal resistance are contrary to the above conclusions. (2 refs.)

100757 Intensity noise associated with the lasing mode of a (GaAl)As diode laser. R.Schimpe (Lehrstuhl fur Allgemeine Elektrotech. und Angewandte Elektronik, Tech. Univ. Munich, Munich, Germany).
IEEE J. Quantum Electron. (USA), vol.QE-19, no.6, p.895-7 (June 1983). (8th IEEE International Semiconductor Laser Conference, Ottawa, Ont., Canada, 13-15 Sept. 1982).
Measurement of the intensity fluctuations of an index guided CW (GaAl)As diode laser are reported. The narrowing of the laser emission spectrum causes a sharp decrease of the low-frequency noise associated with the lasing mode. This observation agrees well with a theoretical relationship derived from the multimode rate equations. (6 refs.)

100758 A nondestructive method for predicting laser emission wavelength from photocurrent spectra of GaAlAs double heterostructure wafers. S.F.Nygren (Bell Labs., Reading, PA, USA).
IEEE J. Quantum Electron. (USA), vol.QE-19, no.6, p.898-905 (June 1983). (8th IEEE International Semiconductor Laser Conference, Ottawa, Ont., Canada, 13-15 Sept. 1982).
Using nondestructive pressure contacts, a GaAlAs double heterostructure (DH) wafer may be operated as a solar cell. When the spectrum of the photocurrent is observed, the band edge of the active layer is clearly identifiable. A model of photocurrent in a GaAlAs DH wafer shows that a reliable measurement of the active layer band edge can be made in spite of substantial variations in spectral shape that can be caused by variations in the GaAs cap layer thickness. Using this method, the emission wavelength of a laser can be predicted to ±62 Å with 90 percent confidence, making photocurrent spectroscopy a useful tool for characterizing wafers. (14 refs.)

100759 Minority carrier lifetime and luminescence efficiency of 1.3 μm InGaAsP-InP double heterostructure layers. C.H.Henry, B.F.Levine, R.A.Logan, C.G.Bethea (Bell Labs., Murray Hill, NJ, USA).
IEEE J. Quantum Electron. (USA), vol.QE-19, no.6, p.905-12 (June 1983). (8th IEEE International Semiconductor Laser Conference, Ottawa, Ont., Canada, 13-15 Sept. 1982).
Minority carrier lifetimes and quantum efficiencies were measured for a series of 1.3 μm InGaAsP active layers. Radiative and nonradiative components of lifetime as a function of electron and hole density were determined from this data. The measured lifetimes were $T \approx 26(10^{18}\ \mathrm{cm}^{-3}/\mathrm{p})^{1.2}$ ns for p-type, and $T \approx 33(10^{18}\ \mathrm{cm}^{-3}/\mathrm{n})^{0.8}$ ns for n-type material. The drop in efficiency with doping is consistent with the ratio of nonradiative and radiative rates being proportional to carrier density. The nonradiative and radiative rates being proportional to carrier density. The nonradiative and radiative rates are equal at $p=(2.5 \pm 0.9)10^{18}\ \mathrm{cm}^{-3}$ and $n=(3.3 \pm 0.7)10^{18}\ \mathrm{cm}^{-3}$. A lifetime of 200 ns was observed for an undoped sample with a 0.2 μm thick active layer. The long lifetime shows that recombination with background traps is quite small, and that the interface recombination velocity is less than 50 cm/s, an order of magnitude less than for AlGaAs-GaAs double heterostructures. The minority carrier lifetime increases with temperature is lightly doped samples, as expected for radiative recombination, and shows little change with temperature in heavily doped samples. If the measured nonradiative rate is assumed to be due to the free carriers and not due to doping related traps, it can nearly account for the temperature dependence of laser threshold currents and for light-emitting diode efficiency. (23 refs.)

100760 Losses in GaInAs(P)/InP and GaAlSb(As)/GaSb lasers—the influence of the split-off valence band. A.Mozer (Stuttgart Univ., Stuttgart, Germany), K.M.Romanek, O.Hildebrand, W.Schmid, M.H.Pilkuhn.
IEEE J. Quantum Electron. (USA), vol.QE-19, no.6, p.913-16 (June 1983). (8th IEEE International Semiconductor Laser Conference, Ottawa, Ont., Canada, 13-15 Sept. 1982).
GaInAs(P)/InP and GaAlSb(As)/GaSb are interesting material systems for long wavelength optical fiber communication. However, laser fabricated from these materials exhibit a substantially higher temperature dependence of the threshold current than GaAs/GaAlAs lasers ('T_0-problem'). Intervalence band absorption and CHSH-Auger-recombination have been suggested as two possible causes for the strong temperature dependent losses in long wavelength lasers. Both mechanisms, if present, should lead to a population of the split-off valence band. In GaInAsP/InP lasers, the authors have studied this population by directly observing the radiative high-energy recombination of electrons with holes in the split-off valence band. In the case of the band structure of GaAlSb(As), the band gap energy E_0 is close or equal to the spin-orbit splitting energy Δ_0, which favors hole-Auger recombination and intervalence band absorption, as confirmed by the authors experimental results. (41 refs.)

100761 The effects of loss and nonradiative recombination on the temperature dependence of threshold current in 1.5-1.6 μm GaInAsP/InP lasers. M.Asada, Y.Suematsu (Dept. of Phys. Electronics, Tokyo Inst. of Technol., Tokyo, Japan).
IEEE J. Quantum Electron. (USA), vol.QE-19, no.6, p.917-23 (June 1983). (8th IEEE International Semiconductor Laser Conference, Ottawa, Ont., Canada, 13-15 Sept. 1982).
Various factors influencing the temperature dependence of the threshold current of GaInAsP/InP lasers in the wavelength region of 1.5-1.6 μm were measured in terms of the gain, the loss, the spontaneous emission, and the carrier lifetime. The effects of the intervalence band absorption influence the differential quantum efficiency or the loss, while the nonradiative recombination and the carrier leakage over the heterobarrier influence the carrier lifetime. It is shown from the measured results that both the absorption and the nonradiative components significantly influence the temperature characteristics of threshold current. The rapid increase in the threshold current near room temperature is a reflection of the increase in the intervalence band absorption. The heating effect due to the injection current is also significant. The possible maximum temperature of CW operation is expected to be as high as 150°C with optimized structural parameters. (22 refs.)

100762 Auger recombination effect on threshold current of InGaAsP quantum well lasers. A.Sugimura (Musashino Electrical Communication Lab., Nippon Telegraph & Telephone Public Corp., Tokyo, Japan).
IEEE J. Quantum Electron. (USA), vol.QE-19, no.6, p.932-41 (June 1983). (8th IEEE International Semiconductor Laser Conference, Ottawa, Ont., Canada, 13-15 Sept. 1982).
The Auger recombination effect on the threshold current of the InGaAsP quantum well (QW) laser is studied theoretically. All possible transitions between the quantized subbands of two-dimensional carriers are taken into account in evaluating the radiative process with the *k*-selection rule and the Auger process. The calculated threshold current agrees well with the reported experimental results for 1.07 μm InGaAsP QW lasers. The Auger component of the threshold current and its temperature dependence strongly depend on the QW structure, resulting in the necessity for an elaborate QW structure design, although both cannot be optimized at the same time. A design procedure is elucidated for a structure which gives the lowest threshold current density of the 1.07, 1.3, and 1.55 μm InGaAsP QW lasers. (23 refs.)

100763 Circuit modelling of the effect of diffusion on damping in a narrow-stripe semiconductor laser. R.S.Tucker, D.J.Pope (Dept. of Electrical Engng., Univ. of Queensland, St. Lucia, Queensland, Australia).
IEEE J. Quantum Electron. (USA), vol.QE-19, no.7, p.1179-83 (July 1983).
This paper describes a circuit modelling technique for directly modulated narrow-stripe semiconductor lasers with strong carrier confinement and index guiding. It is shown that diffusion damping of the modulation response, due to a nonuniform electron density distribution in the active layer, can be accounted for in terms of an equivalent optical gain saturation. Based on this equivalence, a small-signal AC circuit model of a narrow-stripe laser is derived. The model can be used to determine the intensity modulation and frequency modulation response characteristics of a packaged device. (14 refs.)

100764 Analysis of a multistable semiconductor light amplifier. K.Otsuka, H.Iwamura (Musashino Electrical Communication Lab., Nippon Telegraph & Telephone Public Corp., Musashino-shi, Tokyo, Japan).
IEEE J. Quantum Electron. (USA), vol.QE-19, no.7, p.1184-6 (July 1983).
A multistable operation in semiconductor laser amplifiers, based upon the carrier density dependence of the active region refractive index is proposed. Simple analytical expressions describing the optical multistability are given, using the so-called antiguidance factor, which is the ratio of the decrease in the real refractive index to the increase in the imaginary refractive index. (17 refs.)

100765 Optical waveguiding in (In, Ga)(As, P) inverted rib waveguide lasers at 1.3 μm wavelength. S.Turley (Standard Telecommunication Labs. Ltd., Harlow, England).
IEEE J. Quantum Electron. (USA), vol.QE-19, no.7, p.1186-95 (July 1983).
A theory is presented for waveguiding in inverted rib waveguide (IRW) lasers. For the first time, theory has been compared with experiment for these structures in (In,Ga)(As,P). Consideration is given to dielectric constant models in the quaternary system. After including the large negative effect of carriers on the dielectric constant, the modified single effective oscillator model is found to be suitable. By applying the dielectric constant values so obtained to the waveguide theory, IRW design curves are produced. Measurements of lateral farfield widths and spectral separations of zero and first order modes are used to test the validity of the predictions. The agreement is very good. The guide strengths are in the range $\Delta\epsilon_G = 3\text{-}11 \times 10^{-2}$ ($\Delta n_G = 5\text{-}17 \times 10^{-3}$). (30 refs.)

100766 Phase noise in semiconductor lasers: a theoretical approach. P.Spano, S.Piazzolla, M.Tamburrini (Fondazione Ugo Bordoni, Rome, Italy).
IEEE J. Quantum Electron. (USA), vol.QE-19, no.7, p.1195-9 (July 1983).
Noise phenomena in semiconductor lasers have been extensively studied from an experimental point of view because of their importance in designing optical communication systems. Recently, a semiclassical theory of laser noise has been presented (Yahala & Yariv, ibid., to be published). In this paper, following a different and simpler approach, the authors obtain analytical expressions for the intensity and phase noise power spectra which agree with experimental results. (12 refs.)

100767 All-binary AlAs-GaAs laser diode. W.D.Laidig, P.J.Caldwell, K.Kim, J.W.Lee (Dept. of Electrical & Computer Engng. North Carolina State Univ., Raleigh, NC, USA).
IEEE Electron Device Lett. (USA), vol.EDL-4, no.7, p.212-14 (July 1983).
Thin layers of AlAs and GaAs, grown by molecular beam epitaxy (MBE), are used to simulate the properties of Al$_x$Ga$_{1-x}$As. These AlAs-GaAs superlattices (SLs) are used as cladding layers (instead of Al$_x$Ga$_{1-x}$As) in heterostructure lasers capable of room temperature operation. It is thus possible to obtain laser diodes which are composed only of the binary compounds GaAs and AlAs. The all-binary lasers are compared to conventional Al$_x$Ga$_{1-x}$As-GaAs double-heterostructure (DH) lasers grown and fabricated under similar conditions. (12 refs.)

100768 High pressure measurements on photopumped low threshold Al$_x$Ga$_{1-x}$As quantum well lasers. M.D.Camras, N.Holonyak,Jr., J.J.Coleman (Electrical Engng. Res. Lab., Univ. of Illinois, Urbana, IL, USA), H.G.Drickamer, R.D.Burnham, W.Streifer, D.R.Scifres, C.Lindstrom, T.P.Paoli.
J. Appl. Phys. (USA), vol.54, no.8, p.4386-9 (Aug. 1983).
Data are presented on the continuous (CW) 300K photopumped laser operation of a low threshold Al$_x$'Ga$_{1-x}$'As-GaAs ($x' \sim 0.30$) single quantum well heterostructure (quantum well size $L_z \sim 60$ Å) subjected to high pressure (0-11 kbar) in a simple opposed anvil apparatus. Beyond ~11 kbar where the central Al$_x$'Ga$_{1-x}$' As waveguide region undergoes a direct-indirect transition, and the waveguide confinement begins to weaken and deep levels tend to become important, the laser threshold increases rapidly and 'quenches' CW 300K operation. Pulsed 300K photopumped laser operation of an undoped 121-period Al$_x$Ga$_{1-x}$As-GaAs ($x \sim 0.5$) superlattice in the pressure range from 0-11 kbar is shown for reference. The pressure coefficients of the quantum well heterostructure and the superlattice lasers are comparable (~11 meV/kbar). (13 refs.)

100769 Spatial and spectral characteristics and a new model of laser generation for CdS-type single crystals under one-photon excitation. M.S.Brodin, N.I.Vitrikhovskii, A.A.Kypen, S.G.Shevel, N.I.Yanushevskii (Inst. of Phys., Acad. of Sci., Kiev, Ukrainian SSR).
Phys. Status Solidi a (Germany), vol.78, no.1, p.349-63 (16 July 1983).
Spatial and spectral characteristics of lasing from Zn$_x$Cd$_{1-x}$S ($0 \leq x \leq 0.5$), CdSe$_x$S$_{1-x}$ ($0 \leq s \leq 0.25$), and CdS single crystals are investigated at temperatures 4.2, 77, and 300K under nitrogen laser excitation. The samples are vapour-grown platelets as well as hexagonal-prism-shaped 'needles'. The inconsistence of the previously wide-spread Fabry-Perot cavity model is shown and an interpretation is proposed in terms of a new model, namely, that of partial cavities (PC), each of them being a rectangular microbox (or microprism for 'needles'). The importance of intermode scattering and optical coupling between the different PC in the process of lasing is shown experimentally. (20 refs.)

100770 Radiative characteristics of injection lasers with short resonators. T.V.Batyunina, Yu.L.Bessonov, V.I.Borodulin, M.V.Zverkov, V.P.Konyaev, O.A.Pashko, S.A.Pashko, V.A.Simakov, V.I.Shveikin (Inst. of Radio Engng., Electronics & Automation, Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.2, p.201-4 (Feb. 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.2, p.364-70 (Feb. 1983).
An investigation was made of the threshold, power, and spectral characteristics of radiation emitted by GaAs-AlAs heterostructure injection lasers with double confinement and short (up to 16 μm) plane-parallel resonators. The lasers had mesastripe contacts 10-14 μm wide. The gain coefficient was a linear function of the pump current density in the gain coefficient range 10-400 cm^{-1}. The minimum threshold currents in the lasers were 27-30 mA and single-frequency lasing regime was observed right up to pump currents of $(1.6\text{-}1.7)I_{\mathrm{th}}$. The maximum single-frequency output power was 35 mW. It should be possible to retain single-frequency regime in such lasers when the pump current was subjected to high-frequency modulation. (11 refs.)

100771 External-cavity diode laser emitting in the middle infrared range. I.I.Zasavitskii, Yu.V.Kosichkin, P.V.Kryukov, A.I.Nadezhdinskii, A.N.Perov, S.Raab, E.V.Stepanov, A.P.Shotov (P.N.Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.2, p.256-7 (Feb. 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.2, p.445-7 (Feb. 1983).
Stimulated emission from an external-cavity diode laser was obtained for the first time in the region of the 10 μ wavelength and high-resolution spectra were recorded under intracavity absorption conditions. (5 refs.)

100772 Subharmonic excitation of injection lasers. F.K.Vaitekunas, Yu.B.Vishnyauskas, S.K.Kurshyalis (V. Kapsukas State Univ., Vilnius, Lithuanian SSR).
Sov. J. Quantum Electron. (USA), vol.13, no.2, p.258-9 (Feb. 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.2, p.447-9 (Feb. 1983).
An analysis was made of resonant subharmonic excitation of injection lasers and a physical interpretation of the process was developed. The range of frequencies in which pulse excitation was possible at the frequency of the first subharmonic of the modulating signal was determined experimentally as a function of a constant pump current. The possibility of excitation of injection lasers at the frequencies of the second and third subharmonics was demonstrated. (7 refs.)

42.55R Lasing action in other solids

(inc. solid Raman lasers)

100773 Intracavity mode-locked and frequency-doubled Nd:YAG laser: pump-and mode-size effects. D.G.Hall (Inst. of Optics, Univ. of Rochester, Rochester, NY, USA), K.C.Scholten.
Appl. Opt. (USA), vol.22, no.15, p.2390-2 (1 Aug. 1983).
The performance of an intracavity mode-locked and frequency-doubled Nd:YAG laser has been analyzed using a method that takes into account the transverse spatial variation of both the gain and the laser mode. The technique leads to a simple numerical procedure that determines the second harmonic power and pulse width in terms of the parameters that characterize the various spatial distributions. (10 refs.)

100774 A YAG:Nd^{3+} ring laser. Zhang Guifen (Shanghai Inst. of Optics & Fine Mech., Acad. Sinica, Shanghai, China).
Chin. Phys. (USA), vol.3, no.2, p.438-43 (April-June 1983).
A directional ratio of about thirty has been obtained in a ring resonator with an additional mirror. The linewidth is compressed by ten times that of the standing-wave resonator without decrease of output power. A new opinion is put forward for the time characteristics of oscillation. (4 refs.)

100775 The NMR-laser—a nonlinear solid state system showing chaos. E.Brun, B.Derighetti, R.Holzner, D.Meier (Phys.-Inst., Univ. Zurich, Zurich, Switzerland).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.825-36 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
The authors report novel experimental observations along the road to chaos of a tuned low-Q solid state spin-flip NMR laser which, according to their earlier work, (Meier et al. 1982) should show the universal Feigenbaum (1978) scenario under certain conditions. They have studied the nonlinear low-frequency response of the NMR laser activity to an external sinusoidal perturbation of one of its system parameters. Comparison of experimental results with computer solutions of an approximate theoretical model based on Bloch-type order parameter differential equations reflect some of the difficulties an experimental may encounter when he is out to detect unpaved physical roads to chaos. (9 refs.)

100776 Lithium niobate laser with frequency-degenerate pumping. S.G.Odulov, M.S.Soskin (Inst. of Phys., Acad. of Sci., Ukrainian SSR).
JETP Lett. (USA), vol.37, no.5, p.289-93 (5 March 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.5, p.243-7 (5 March 1983).
For the first time, lasing has been achieved in a frequency-degenerate four-wave interaction of beams for a helium-cadmium laser in lithium niobate crystals with nonlocal nonlinearities. The nonlinearities result from a redistribution of space charge during diffusion of the photoexcited carriers or from photovoltaic currents that oscillate over space. (17 refs.)

100777 Stimulated emission of Ho^{3+} in BaTm$_2$F$_8$ and Tm^{3+} ions in BaYb$_2$F$_8$:Er^{3+} crystals. A.A.Kaminskii, B.P.Sobolev, T.V.Uvarova (A.V. Shubnikov Inst. of Crystallography, Acad. of Sci., Moscow, USSR).
Phys. Status Solidi a (Germany), vol.78, no.1, p.K13-17 (16 July 1983).
The authors deal with the stimulated emission (SE) investigation of Ho^{3+} ions in BaTm$_2$F$_8$ and Tm^{3+} in BaYb$_2$F$_8$:Er^{3+} single crystals. The spectral composition of SE generation (λ_g) was studied by the photoelectric method (accuracy ±0.0005 μm). The excitation of 2 μm SE of Ho^{3+} and Tm^{3+} ions in the crystals is promoted by an effective energy transfer from sensitizer ions. For Ho^{3+} this role is played by Tm^{3+}, and for Tm^{3+} by Yb^{3+} and Er^{3+} ions. Under experimental conditions laser action of Ho^{3+} was obtained til ≈230K, that of Tm^{3+} till ≈150K. (13 refs.)

100778 Single-frequency YAG:Nd^{3+} laser with ring resonator. P.A.Andreev, S.V.Kruzhalov, L.N.Pakhomov, V.Yu.Petrun'kin (Leningrad Polytech. Inst., Leningrad, USSR).
Radiophys. & Quantum Electron. (USA), vol.25, no.9, p.727-31 (Sept. 1982). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.25, no.9, p.1012-17 (Sept. 1982).
Emission of a YAG laser in the single-frequency mode is analyzed on the basis of equations of a semiclassical theory, taking into account the effect of backscattering and of the small difference between Q factors of the ring resonator with respect to opposing waves. It is demonstrated that the small difference between the respective Q factors has a large effect on the stability of unidirectional emission, with hardly any effect on the intensity ratio of opposing waves. Corrections are added to the relaxation frequencies which account for the interaction of opposing waves through the backscattering mechanism. (9 refs.)

100779 Steady-state emission from a Y$_3$Al$_5$O$_{12}$:Er^{3+} laser (λ=2.94 μ, T=300K). Kh.S.Bagdasarov, V.I.Zhekov, V.A.Lobachev, T.M.Murina, A.M.Prokhorov (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.2, p.262-3 (Feb. 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.2, p.452-4 (Feb. 1983).
Experimental and theoretical studies demonstrated that steady-state emission was possible from an YAG:Er^{3+} laser utilizing the self-terminating $^4I_{11/2}$-$^4I_{13/2}$ transition with a cross-relaxing lower level ($^4I_{13/2}$). (1 ref.)

42.55T Free electron lasers

100780 Operating conditions for free-electron lasers. Lei Shezhan, Zhou Zhongyi (Shanghai Inst. of Optics & Fine Mech., Acad. Sinica, Shanghai, China).
Chin. Phys. (USA), vol.3, no.2, p.444-9 (April-June 1983).
Conditions for amplifying light radiation by relativistic electrons in the interaction between light and electrons have been analyzed. It is shown that only when both the phase relation and the frequency relation are satisfied would the incident radiation have higher net gain. (2 refs.)

100781 High-efficiency free-electron laser results. K.Boyer, C.A.Brau, B.E.Newnam, W.E.Stein, R.W.Warren, J.G.Winston, L.M.Young (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3076-7 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Results obtained with a tapered-wiggler free-electron laser demonstrate the concepts proposed by Morton (1980) for enhanced efficiency. They show deceleration of electrons by as much as 7%, and extraction of more than 3% of the total electron-beam energy as laser energy when the laser is operated as an amplifier. The experiment is presently being reconfigured to examine its performance as a laser oscillator. (4 refs.)

100782 The UK free electron laser project. M.W.Poole, G.Saxon, R.P.Walker (SERC, Daresbury Lab., Daresbury, Warrington, England), S.D.Smith, C.R.Pidgeon, W.J.Firth, J.M.Reid, M.G.Kelliher, W.A.Gillespie.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3091-3 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Construction of apparatus for a free electron laser experiment is being undertaken by a collaboration involving principally groups at the Heriot-Watt and Glasgow Universities and at the SERC Daresbury Laboratory. The experiments will be centred on 10.6 μm but a tuning range of at least 2-20 μm will be investigated. The gain has been optimised in a regime of large linewidth broadening arising from the electron beam and wiggler magnet properties. The performance of the electron linac source is being improved and a new beam line is under construction. A periodic magnet design utilising samarium cobalt blocks has been chosen and will be assembled and tested shortly. (8 refs.)

100783 Subharmonic triple buncher for a high-efficiency free electron laser. J.S.Fraser (Los Alamos Nat. Lab., Los Alamos, NM, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3115-17 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A high-efficiency free electron laser oscillator experiment is being constructed at Los Alamos National Laboratory. A buncher system has been designed to deliver 30-ps, 5-nC electron bunches to a 20-MeV standing-wave linac at the 60th subharmonic of the 1300-MHz accelerator frequency. The first 108.3-MHz buncher cavity accepts a 5-ns, 5-A peak current pulse from a triode gun. Following a 120-cm drift space, a second 108.3-MHz cavity is used, primarily to enhance the bunching of the trailing half of the bunch. A 1300-MHz cavity with 20-cm drift spaces at each end completes the beamline components. The bunching process continues into the linac's first three accelerating cells. Two thin iron-shielded lenses and seven large-diameter solenoids provide axial magnetic fields for radial focusing. (7 refs.)

100784 Time-resolved electron beam diagnostics for the Los Alamos free-electron laser oscillator experiment. A.H.Lumpkin, J.S.Fraser, R.W.Warren, C.A.Brau (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3139-41 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Measurement of the time-dependent electron beam energy distributions in the Los Alamos Free-Electron Laser (FEL) Oscillator Experiment will be accomplished by employing gated proximity focussed microchannel-plate intensified vidicon cameras, an electron spectrometer employing a fluorescent target, and synchronized electron beam deflection techniques. General diagnostic system design features are described that provide information in the 30-ps, 50-ns, 10-μs, and 100-μs time regimes. These techniques provide a real-time electron micropulse optimization diagnostic and an on-line, time resolved measurement of the energy lost by the electrons within the optical cavity. (7 refs.)

100785 Wiggler-free free electron waveguide laser in a uniform axial magnetic field: single particle treatment. A.Fruchtman (Center for Plasma Phys., Racah Inst. of Phys., Hebrew Univ. of Jerusalem, Jerusalem, Israel).
J. Appl. Phys. (USA), vol.54, no.8, p.4289-94 (Aug. 1983).
A wiggler-free free electron laser operating in a waveguide is analyzed by using a single particle treatment. The use of either a TE or a TM mode is shown to enhance the gain for a resonant frequency much higher than the cyclotron frequency. It is demonstrated that a source of a submillimeter radiation, based on this analysis, may have output power comparable to that of a wiggler-type free electron laser. (14 refs.)

100786 Stimulated emission from a relativistic electron beam in a variable-parameter longitudinal magnetic wiggler. W.A.McMullin, R.C.Davidson, G.L.Johnston (Plasma Fusion Center, MIT, Cambridge, MA, USA).
Phys. Rev. A (USA), vol.28, no.2, p.517-23 (Aug. 1983).
The single-particle equations of motion are used to study the stimulated emission from a tenuous relativistic electron beam propagating in the combined solenoidal and variable-parameter longitudinal wiggler magnetic fields produced near the axis of a multiple-mirror (undulator) field configuration. The specific case of constant field amplitude and variable wiggler periodicity is studied. It is found that the efficiency of radiation generation can be increased by orders of magnitude relative to the case where the wiggler periodicity is constant. This is due to the fact that the phase velocity of the ponderomotive potential in which the electrons are trapped is decreasing, allowing the electrons to exchange energy with the radiation field. (8 refs.)

100787 Coherent radiation of electron bunches in free-electron lasers. L.A.Gevorgyan, N.K.Zhevago (Phys. Inst., Erevan, USSR).
Sov. Phys.-Dokl. (USA), vol.27, no.11, p.946-8 (Nov. 1982). Translation of: *Dokl. Akad. Nauk SSSR,* vol.267, no.1-3, p.599-601 (Nov. 1982).
The possibility of increasing the efficiency of conversion of the energy of an electron beam into energy of coherent radiation and also of generation in the shorter-wavelength range of the ultraviolet region is usually associated with the use of electron-storage rings. The authors consider another possibility: increasing the efficiency of free-electron lasers. In the case considered, use is made of coherence of the radiation from different electrons—an effect which arises when the electron beam is grouped in a particular way into individual bunches with a rather high particle density. 42.60 LASER SYSTEMS AND LASER BEAM APPLICATIONS

100788 High dynamic range laser energy distribution mapping using dual charge injected device (CID) cameras as an imaging radiometer. R.W.Priddy (US Army Missile Command, Redstone Arsenal, AL, USA), G.L.Boylston.
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.356, p.106-15 (1983). (Field Measurement and Calibration Using Electro-Optical Equipment: Issues and Requirements, San Diego, CA, USA, 24-25 Aug. 1982).
Radiometric imaging techniques have direct application for measurement of reflected laser energy distribution. Common camera techniques have certain shortcomings stemming from limited dynamic range and imaging characteristics associated with specific detector and camera systems. The authors discuss various techniques which can be used to overcome camera deficiencies and a technique for cascading multiple camera systems over a range of sensitivities, thereby increasing the overall dynamic range. When coupled with suitable software routines, multiple camera systems can be used as an imaging radiometer suitable for measuring laser energy distribution and developing distribution maps. (4 refs.)

100789 Influence of nozzle profile on the characteristics of a gas-dynamic laser. V.I.Kireev, S.N.Minin, U.G.Pirumov.
Fluid Dyn. (USA), vol.17, no.6, p.948-52 (Nov.-Dec. 1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Zhidk. & Gaza,* vol.17, no.6, p.163-7 (Nov.-Dec. 1982).
The results are given of numerical profiling and analysis of the influence of nozzle shape and the gas-dynamic parameters on the characteristics of gas-dynamic lasers. Investigation of the two-dimensional nonequilibrium flow in a family of similar nozzles and nozzles with different angles of inclination of the contracting part show that it is expedient to choose a shape of the subsonic part that ensures a straight sonic line. Relationships between the geometrical parameters of the subsonic and transonic part of the nozzle are recommended which ensure separationless flow and a shape of the sonic surface that is nearly flat. A parametric investigation was made of the supersonic section of two classes of planar gas-dynamic laser nozzles constructed on the basis of uniform and symmetric characteristics at the exit. The parametric investigations of the influence of the degree of expansion, the total pressure and the temperature, and also the gas composition show that the smallest losses of useful vibrational energy in the cavity was achieved for nozzles constructed on the basis of uniform characteristics. (15 refs.)

100790 A cyclotron resonance laser accelerator. P.Sprangle, L.Vlahos, C.M.Tang (US Naval Res. Lab., Washington, DC, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3177-9 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A laser acceleration mechanism which utilizes a strong static, almost uniform, magnetic field together with an intense laser pulse is analyzed. The interaction and acceleration mechanism relies on a self resonance effect. Since the laser field is assumed to be diffraction limited, the magnetic field must be spatially varied to maintain resonance. The effective accelerating gradient is shown to scale like $1/\sqrt{E_b}$, where E_b is the electron energy. For a numerical illustration the authors consider a 1×10^{13} W/cm^2, CO_2 laser and show that electrons can be accelerated to more than 500 MeV in a distance of 15 m (approximately two Rayleigh lengths). (9 refs.)

100791 Measurement of XeCl laser system high-voltage pulses employing a quartz Pockels cell. E.A.Ballik (Dept. of Engng. Phys., McMaster Univ., Hamilton, Ontario, Canada), D.W.Liu.
IEEE J. Quantum Electron. (USA), vol.QE-19, no.7, p.1166-8 (July 1983).
A high-voltage measuring system, employing a quartz Pockels cell, is described. The system is capable of a large voltage range, a fast response time (ns), a high SNR, an excellent accuracy, a good linearity, and high reliability. Furthermore, the Pockels cell can be isolated from ground potential. Equally important, the detection system can be isolated from sources of electrical noise present in, for example, fast discharges. (7 refs.)

100792 Laser measurement services at NBS. C.N.Smith (Dept. of Commerce, NBS, Boulder, CO, USA).
Laser Focus (USA), vol.19, no.8, p.53-5 (Aug. 1983).
Describes the calibration procedures and standards provided by the National Bureau of Standards (NBS) which are available to end users and manufacturers of lasers, energy and power meters, mirrors, beam splitters and other devices. (no refs.)

100793 A simple passive technique for generating short pulses. S.A.Shakir (Dept. of Phys., Yarmouk Univ., Irbid, Jordan).
Opt. Commun. (Netherlands), vol.47, no.1, p.1-4 (1 Aug. 1983).
It is shown that the pulse reflected from a thin optical slab is related in a simple way to the transmitted pulse. When the thickness of the slab is chosen such that the CW reflectance amplitude at the carrier frequency is zero (anti-reflecting), the reflected pulses can be of durations much shorter than the incident pulse. (7 refs.)

100794 High-efficiency pulse compression with intracavity Raman oscillators. R.Frey, A.de Martino, F.Pradere (Lab. d'Optique Quantique, CNRS, Ecole Polytech., Palaiseau, France).
Opt. Lett. (USA), vol.8, no.8, p.437-9 (Aug. 1983).
High-efficiency pulse compression has been obtained by using an intracavity Raman oscillator. The energy of a primary laser stored in its high-*Q* cavity is extracted at the Stokes frequency by means of a Stokes laser having a high Raman gain and a low-*Q* cavity. This technique, using hydrogen gas as the Raman medium, permits shortening of the pulse duration of a ruby laser by a factor of 6.7 with 87% effective quantum efficiency. It would be especially useful with low-gain (alexandrite) and with short-storage-lifetime lasers. (6 refs.)

42.60B Design of specific laser systems

100795 Fabrication technique of fine gratings in two-dimensional diode lasers. M.Kohno, K.Uomi, H.Taniguchi, I.Suemune, M.Yamanishi.
Bull. Fac. Eng. Hiroshima Univ. (Japan), vol.30, no.2, p.75-81 (Nov. 1982). In Japanese.
Reports the establishment of the fabrication technique for two-dimensional diode lasers. A key point for realizing two-dimensional diode lasers is to fabricate gratings with a sufficient angular accuracy on GaAs. The gratings on GaAs were fabricated by chemical etching after holographic exposure of photoresist film. The required angular accuracy of the perpendicularity was assured by a He-Ne laser beam reflected from the cleaved facet of the sample and the error was within 0.02°. Finally, the authors demonstrate a successful operation of their transverse-distributed-feedback cavity (TDFB/Cavity) laser fabricated by the present technique. (10 refs.)

100796 New single-pulse generation technique for distributed feedback dye lasers. Z.Bor, F.P.Schafer (Max-Planck-Inst. fur Biophys. Chem., Gottingen, Germany).
Appl. Phys. B (Germany), vol.B31, no.4, p.209-13 (Aug. 1983).
The distributed feedback dye laser (DFDL) generates a train of picosecond pulses when pumped well above threshold. This DFDL emission can be quenched by injecting a laser pulse into DFDL. By proper timing of the quencher laser pulse only the first DFDL pulse is generated while the successive pulses are suppressed. Operational characteristics and practical design considerations of such a quenched DFDL are given. With 2.5 ns long pump pulses from a N_2 laser, a shortest DFDL pulse of 17 ps was obtained at 380 nm. (10 refs.)

100797 Cleaning of GaAs surfaces with low-damage effects using ion-beam milling. C.Lindstrom, P.Tihanyi (Xerox Palo Alto Res. Centers, Palo Alto, CA, USA).
IEEE Trans. Electron Devices (USA), vol.ED-30, no.6, p.711-13 (June 1983).
A low-damage ion-beam cleaning technique for GaAs surfaces is presented. The technique is utilized on GaAs/GaAlAs diode lasers, using the cleaved mirrors to analyze the milling performance. The authors found that (which also have been indicated by another author) nitrogen ions give no or very little surface damage. Contrarily, the commonly used argon ions are shown to create mirror surface damage detrimental to the laser diode performance. Auger depth profile of the GaAs oxygen contaminants reveals that 100-Å etch depth is sufficient to remove the native surface oxide. This etch depth is within the limits studied in this investigation. (7 refs.)

100798 Long pulse DCM dye laser. P.G.Weber (Los Alamos Nat. Lab., Los Alamos, NM, USA).
IEEE J. Quantum Electron. (USA), vol.QE-19, no.7, p.1200-2 (July 1983).
The author describes a flashlamp pumped dye laser, incorporating both prepulse and simmer enhancement, which is capable of kW outputs for the 0.1 ms duration of the flashlamp pulse. The laser has been operated with the new dye DCM; the author finds that using oxygen or nitrogen gas in the dye solution greatly increases both laser amplitude and pulse duration. (14 refs.)

100799 New class of gain guiding laser with a tapered-stripe structure. T.Mamine, T.Oda, O.Yoneyama (Semiconductor Res. Dept., Sony Corp., Atsugi-shi, Japan).
J. Appl. Phys. (USA), vol.54, no.8, p.4302-4 (Aug. 1983).
A new class of gain guiding laser with a tapered-stripe structure has been developed which exhibits a linear dependence of light output on CW current, a stable single-lobe far-field pattern along the junction at the power level of more than 10 mW, and an amount of astigmatism below 20 μm. It is also shown that a thin active layer thickness is desirable to achieve a stable lateral mode. The main feature of the tapered-stripe structure is that it offers an additional degree of freedom in controlling the beam spot size and the radius of curvature of the phase front separately, by varying the widths as well as the length of the tapered stripe. (12 refs.)

100800 A simplified, miniature TEA-CO_2 laser using a semiconductive pre-ionization technique. P.Pace, M.Hale, J.Cruickshank (Defence Res. Establ., Valcartier, Quebec, Canada).
Opt. & Laser Technol. (GB), vol.15, no.4, p.189-90 (Aug. 1983).
Using a pre-ionization system based on a silicon carbide compound and a pulse-forming network using a vacuum relay, the authors have been able to significantly reduce TEA-CO_2 laser complexity while maintaining high output energy densities. The design and construction are detailed along with the experimentally obtained laser characteristics. (12 refs.)

100801 A long-pulse xenon ion laser as a pumping source for dye lasers. G.Bergamasco (Istituto di Fisica Univ., Ferrara, Ferrara, Italy), W.Cecchetti, R.Polloni.
Opt. & Laser Technol. (GB), vol.15, no.4, p.191-3 (Aug. 1983).
A simple xenon ion laser that is either sealed or has a gas flow mode is described. The laser delivered long pulses (~15 μs) of almost 1 kW peak power. It has been used to pump a dye laser employing the same configuration as CW dye lasers. The system is inexpensive and can be mode-locked, enabling it to yield ultrashort pulses comparable in duration to those delivered by CW argon laser-pumped dye lasers but with much higher peak powers. (8 refs.)

100802 A pulsed argon ion laser and ring dye laser system. P.Myslinski, Cz.Radzewicz, J.Krasinski (Inst. of Experimental Phys., Warsaw Univ., Warszawa, Poland).
Opt. Appl. (Poland), vol.13, no.1, p.33-8 (1983).
The structure and performance of the pulsed argon ion laser are described. The discharge conditions were optimized and the peak power of 20 W was obtained at 1 kHz repetition rate with excellent reproducibility. A structure for a single mode ring dye laser pumped by the argon ion laser is presented. (8 refs.)

100803 High-power rhodamine 6G laser with an extended service life. B.A.Knyazev, S.V.Lebedev, E.P.Fokin (Inst. of Nuclear Phys., Acad. of Sci., Novosibirsk, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.2, p.146-50 (Feb. 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.2, p.276-82 (Feb. 1983).
A laser was constructed in which rhodamine G dissolved inisopropyl alcohol was used as the active medium. It was pumped by a coaxial flashlamp and the output energy of the laser was up to 8 J. An investigation was made of the photochemical stability of rhodamine G solutions as a function of the spectral composition of the pump radiation. Optimal selection of the solvent and of a filter through which the pump radiation was passed, and the use of previously tested components ensured that the service life was superior to that of similar lasers; practically no maintenance was needed during operation. The operating characteristics of the laser and the dynamics of their changes over a period of three years of its use in applications were recorded. When the output energy was ~5 J per pulse, the laser could emit 1.5×10^3 pulses without dismantling and replacement of the active medium and this represented an integrated irradiance of the active medium in excess of 2 kJ/cm^3. (29 refs.)

100804 Pulsed chemical HF laser utilizing a mixture of technical-grade C_3H_8 and SF_6 and initiated by an electric discharge. D.D.Malyuta, V.F.Tolstov (I.V. Kurchatov Inst. of Atomic Energy, Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.2, p.253-4 (Feb. 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.2, p.441-3 (Feb. 1983).
An electrochemical HF laser was constructed utilizing a mixture of technical-grade propane and butane with SF_6. A resistive anode was made of a Ge single crystal ($\rho = 25$ Ω.cm) and the mixture was subjected to ultraviolet preionization. The output radiation was highly stable. In the nonselective lasing regime a discharge volume of 86 cm^3 yielded laser pulses of 220 mJ energy with a peak power of 3 MW. The energy corresponding to the individual $P_1(4\text{-}9)$, $P_2(3\text{-}8)$, and $P_3(3\text{-}8)$ transitions was in the range 15-43 mJ and the peak powers for these lines were 0.2-0.5 MW. 42.60D Laser resonators and cavities

100805 Cylindrical Gaussian-Hermite modes in rectangular waveguide resonators. L.R.Elias, J.C.Gallardo (Quantum Inst., Univ. of California, Santa Barbara, CA, USA).
Appl. Phys. B (Germany), vol.B31, no.4, p.229-33 (Aug. 1983).
Approximate solutions to the wave equation inside a rectangular metallic waveguide has been obtained in terms of cylindrical Gaussian-Hermite functions. E_{mn}^{π} modes propagate with negligible straight guide losses in the far-infrared region. A new type of low-loss optical resonator suitable for FEL operation at long wavelengths is presented here. (5 refs.)

100806 Generation and applications of pico- and femto-second laser impulses. W.Kaiser (Phys. Dept., Tech Univ. Munchen, Munchen, Germany).
Phys. Bl. (Germany), vol.39, no.7, p.194-8 (July 1983). In German.
Different types of laser materials are suitable for pico-second (ps) laser impulses at variable frequencies and small band width. Impulses of 30 femto-seconds (fs) can be generated in a ring-shaped resonator. An impulse length of 15 μm can be attained with a 50 fs impulse in air. At a wavelength of 0.6 μm about 25 maxima and minima of the field amplitude were found. Assuming an energy of only 3×10^{-5} joule (or 10^{14} photons) one gigawatt can be calculated. The corresponding high electric field strengths (2×10^6 v/cm) are responsible for nonlinear optical phenomena. With regard to the lifetime of eigen vibrations of polyatomic molecules in liquids, it is important that one can discriminate between phase relaxation and energy relaxation. The rise and fall of induced absorption in GaAs crystals within about 70 ps could be measured. Thermal equilibrium was established between electrons and holes of a plasma within 25 ps. The plasma temperature fell from 65K to 35K within 200 ps. (13 refs.) *R.S.*

100807 Method for altering the Q factor of a laser by a glass plate. N.N.Il'ichev, A.A.Malyutin (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.2, p.264 (Feb. 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.2, p.454-5 (Feb. 1983).
An analysis is made of a method for altering the Q factor of a laser resonator containing Brewster plates. The method is based on introduction of an additional plate, again oriented at the Brewster angle, and its rotation about the longitudinal axis of the resonator. It is shown that the plane of polarization of the output radiation exhibits a 'pulling' effect which gives rise to a different dependence of the losses on the angle of rotation of the new plate than that predicted by earlier calculations. (2 refs.)

100808 Active alignment of the feedback mirror in a half symmetrical unstable resonator with an inner axicon. S.J.Cusumano, J.M.Santiago (Air Force Weapons Lab., Kirtland AFB, NM, USA).
24th Midwest Symposium on Circuits and Systems, Albuquerque, NM, USA, 29-30 June 1981 (North Hollywood, CA, USA: Western Periodicals 1981), p.288-300
A multidither resonator alignment scheme has been developed which automatically aligns the optical components of a laser to optimize its performance and then maintains the alignment despite further disturbances to the optical components. This was demonstrated on a reflaxicon-cone. Half Symmetric Unstable Resonator with Internal Axicon (HSURIA) laser, controlling azimuth and elevation of the feedback mirror to maximize Far Field Power-in-the-Bucket. (6 refs.)

42.60F Laser beam modulation

100809 90-fs tunable optical pulses obtained by two-stage pulse compression. B.Nikolaus, D.Grischkowsky (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA).
Appl. Phys. Lett. (USA), vol.43, no.3, p.228-30 (1 Aug. 1983).
Reports a factor of 65 compression of the 5.9-ps [full width at half-maximum (FWHM)] pulses from a mode-locked dye laser by a two-stage technique. In each stage the laser pulses were frequency broadened and linearly chirped by passage through a single-mode optical fiber, and then compressed by traversal of a diffraction grating based dispersive delay line. The final compressed output pulses had pulse widths of 90 fs (FWHM), peak powers of more than five times that of the input pulses, and were continuously tunable over the 300-Å range of the laser dye. (7 refs.)

100810 Picosecond pulse generation by distributed feedback dye lasers. Z.Bor, B.Racz, G.Szabo (Jate Univ., Szeged, Hungary), A.Muller, H.-P.Dorn.
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.383-92 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
The recently observed self-Q-switching effect occurring in distributed feedback dye lasers (DFDL) now opens an alternative way to ultrashort pulse generation. This new technique has many advantages over the mode-locking technique. (20 refs.)

100811 Pulses from an Ar^+-laser in the colliding pulse mode locking regime. D.Kuhlke, W.Rudolph (Phys. Dept., Friedrich-Schiller-Univ. Jena, Jena, Germany).
Opt. Commun. (Netherlands), vol.47, no.1, p.70-2 (1 Aug. 1983).
The pulse emission from an Ar^+-laser passively mode locked by the dye Rh 6G is investigated. Autocorrelation and cross correlation measurements show that a two pulse regime where the pulses interact coherently in the absorber is most favourable with respect to small pulse widths and stability. (7 refs.)

42.60H Optical problems related to properties and interactions of laser beams

100812 Pulsed laser beam control by hot spot tracking. J.S.Accetta (J.S. Accetta Inc., Ann Arbor, MI, USA), A.Erteza.
Appl. Opt. (USA), vol.22, no.15, p.2286-93 (1 Aug. 1983).
The use of a self-developed body-centered reference for precision pulsed laser hot spot tracking is examined through a numerical computer simulation based on a solution of the heat equation with time varying input flux. Tracking resolution and sensitivity in two commonly used infrared sensor bands are compared. To cope with inherent instability, a simple compensation scheme is suggested with a demonstrated improvement in boresight error drift. Optimum performance is obtainable by judicious selection of sensor wavelength bands and sampling times relative to laser pulse time. (2 refs.)

100813 Characterisation of a train of subpicosecond laser pulses by fringe resolved autocorrelation measurements. T.Mindl, P.Hefferle, S.Schneider, F.Dorr (Inst. fur Phys. und Theoretische Chem., Tech. Univ. Munchen, Munchen, Germany).
Appl. Phys. B (Germany), vol.B31, no.4, p.201-7 (Aug. 1983).
Fringe resolved autocorrelation functions generated by a train of subpicosecond laser pulses from a synchronously pumped ring dye laser were recorded. By comparison with calculated correlation functions one can not only derive the pulse duration of the centre pulse, but also draw conclusions about the quasicontinuous background or satellite pulses of lower intensity. (9 refs.)

100814 New approach towards frequency stabilisation of linewidth-narrowed semiconductor lasers. C.J.Nielsen, J.H.Osmundsen (Electromagnetics Inst., Tech. Univ. of Denmark, Lyngby, Denmark).
Electron. Lett. (GB), vol.19, no.16, p.644-6 (4 Aug. 1983).
By means of controlling the injection current and the phase of optical feedback, simultaneous frequency stabilisation and line-width reduction of a semiconductor laser are demonstrated. Line-width reduction from 24 MHz to 300 kHz and mean frequency stability better than 800 Hz relative to a Fabry-Perot etalon are obtained. (5 refs.)

100815 Spectral hole burnings at high energy tails in spontaneous emission and hot carrier relaxation in InGaAsP lasers. M.Yamanishi (Dept. of Phys. Electronics, Hiroshima Univ., Higashi-Hiroshima, Japan), I.Suemune, K.Nonomura, N.Mikoshiba.
IEEE J. Quantum Electron. (USA), vol.QE-19, no.6, p.924-9 (June 1983). (8th IEEE International Semiconductor Laser Conference, Ottawa, Ont., Canada, 13-15 Sept. 1982).
Spectral hole burnings in spontaneous emission spectra from 1.3 μm InGaAsP lasers were found. The results are understood on the basis of population burnings of holes associated with the saturation of intervalence-band absorption. Theoretical results on hot carrier relaxation are shown to explain the population burnings, pointing out an importance of nonequilibrium optical phonon populations in the active layers of long wavelength InGaAsP lasers and light emitting diodes (LEDs). (30 refs.)

100816 Influence of self-sustained pulsation in semiconductor lasers on optical transmission system. K.Iwashita, K.Nakagawa (Yokosuka Electrical Communication Lab., Nippon Telegraph & Telephone Public Corp., Kanagawa, Japan).
IEEE J. Quantum Electron. (USA), vol.QE-19, no.7, p.1173-8 (July 1983).
Degradations in semiconductor lasers caused by defects, such as dark lines or dark spots in an active region, sometimes introduce self-sustained pulsations. In this paper, dynamic properties of a modulated self-sustained pulsation InGaAsP/InP semiconductor laser are presented and the influence on the optical transmission system is described. In high-speed pulse modulation above the pulsation frequency, output waveforms showed a marked pattern effect. When the pulsing semiconductor laser is modulated below the pulsation frequency, the laser output had relatively large noise which had flat noise spectra. Therefore, error-rate characteristics were influenced by this noise. These results show that the self-sustained pulsations in semiconductor lasers sometimes cause transmission characteristics degradation on the optical transmission system. Therefore, careful attention should be paid to this matter. (7 refs.)

100817 Low temperature operation of an S_2 laser using radio frequency simmer discharges. K.P.Killeen, J.E.Epler, J.T.Verdeyen (Univ. of Illinois, Urbana, IL, USA).
IEEE J. Quantum Electron. (USA), vol.QE-19, no.7, p.1203-9 (July 1983).
Technological problems stemming from high temperature operation of the sulfur resonator have hindered its development as a tunable, efficient, discharge pumped laser. The use of RF simmer discharge is shown to reduce previous temperature constraints by dissociating polyatomic sulfur molecules into the dimer, such that lasing is achieved when pumped by an XeCl excimer laser. The peak power output of the S_2 laser and the transmission spectra through sulfur discharges are used to infer the effectiveness of the discharge in dissociating the vapour. (20 refs.)

100818 Scattering of light and acoustic disturbances in the atomic iodine laser. M.E.Riley (Sandia Nat. Labs., Albuquerque, NM, USA).
IEEE J. Quantum Electron. (USA), vol.QE-19, no.7, p.1209-16 (July 1983).
Large photodissociation atomic iodine laser oscillators have been observed to develop gas dynamic instabilities during pumping and lasing. In the present work the growth rate of fluctuations is analysed in a linearised description of the total coupled gas dynamics, chemistry and lasing. The total growth factor of the gas dynamic instabilities is found to be several orders of magnitude for typical laser parameters. In addition, the predicted scale size of the disturbances is in harmony with the observations. (14 refs.)

100819 Temporal and interference fringe analysis of TEM_{01}* laser modes. J.M.Vaughan, D.V.Willets (Royal Signals & Radar Establ., Malvern, England).
J. Opt. Soc. Am. (USA), vol.73, no.8, p.1018-21 (Aug. 1983).
The properties of TEM_{01}*Y doughnut modes have been examined by frequency analysis and by two-beam interference. Interpretation in terms of an evolving helix, made up to two orthogonal TEM_{01} modes of different frequency, is supported by computer simulation of fringe patterms. These patterns are shown to correspond closely with photographic recordings; the implications of the phenomena for the crossed-beam technique in laser velocimetry are outlined. Finally, the possibility of developing a beam of pure helical cophasal surface is discussed and its interference patterns analyzed. (7 refs.)

100820 Self-transparency of Bragg mirrors. K.B.Dedushenko, A.I.Maimistov.
J. Appl. Spectrosc. (USA), vol.37, no.4, p.1199-204 (Oct. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.4, p.653-60 (Oct. 1982).
The authors use the technique of coupled waves to analyze the influence of radiation upon the characteristics of Bragg mirrors. They show that at some intensity of the incident light wave, the transmission coefficient, i.e. the self-transparency of the Bragg mirror, increases sharply. The self-transparency of the mirror attenuates the generation of radiation in semiconductor lasers with distributed Bragg mirrors. (14 refs.)

100821 Time-dependent spectra of ultra-short laser pulses. R.Gase, M.Schubert (Dept. of Phys., Friedrich-Schiller-Univ. Jena, Jena, Germany).
Opt. Acta (GB), vol.30, no.8, p.1125-38 (Aug. 1983).
Deals with the investigation of ultrafast radiation phenomena using a dynamic spectrograph. The general relations previously derived by the authors on the characterization of the spectral properties of incident non-stationary radiation, as well as on the derivation of the input spectrum from the square-law detector time-dependent output spectrum, are applied to examples that are of importance in ultrashort phenomena. In particular, single bandwidth-limited pulses and a train of pulses are studied. The use of a grating and a realistic prism spectrometer are considered. The theoretical and experimental investigations take into account the influence of the 'uncertainty product' of the spectrometer. For a single ultrashort laser pulse, the time-dependent spectrum was determined experimentally; the pulse was found to be nearly bandwidth-limited. (17 refs.)

100822 Broad band electro-optic tuning of a CW dye laser. C.Chappuis, J.P.Goedgebuer (Lab. d'Optique, Univ. de Franche-Comte, Besancon, France).
Opt. Commun. (Netherlands), vol.47, no.1, p.12-17 (1 Aug. 1983).
The many advantages of broad-band systems are not fully exploitable without the availability of intense sources with high radiance and emitting on a broad spectral band. An electro-optic tuning of a commercial CW dye laser is proposed for simulating such sources. A conventional intra-cavity Pockels cell is used for simulating such sources. The main characteristics of laser emission are discussed (linewidth, polarization, tuning speed, etc.); the applications given as examples deal with metrology (surface testing) and optical transmission by spectral modulation of light. (13 refs.)

100823 An estimate of the effect of interference on the reflection of the radiated power of a laser beam from a stratified receiver. Ye.I.Ivlev.
Radio Eng. & Electron. Phys. (USA), vol.27, no.10, p.44-8 (Oct. 1982). Translation of: *Radiotekh. & Elektron. (USSR)*, vol.27, no.10, p.1906-10 (Oct. 1982).
The reflection coefficient of a stratified receiver such as multilayered mirrors is derived and analyzed with a consideration of spatial distribution of incident laser radiation beams. The suppression of the interference effect on the reflection coefficient is examined. Results of an experimental test and the spectral curve of the reflection coefficient of the developed receiver are given. (25 refs.)

100824 Problem of stabilization of laser radiation parameters. O.O.Silichev (Physicotech. Inst., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.2, p.172-7 (Feb. 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.2, p.319-26 (Feb. 1983).
An analysis is made of the possibility of stabilization of the spatial parameters of laser radiation by the use of an optimal resonator configuration and an optical transmission system in the presence of fluctuations of the intracavity lens type. Conditions are formulated which such a resonator configuration must satisfy. Optical transmission systems capable of stabilizing the required parameter of output radiation are proposed and analyzed. (9 refs.)

100825 Formation of the spatial structure of radiation in solid-state laser systems by apodizing and hard apertures. V.I.Kryzhanovskii, B.M.Sedov, V.A.Serebryakov, A.D.Tsvetkov, V.E.Yashin.
Sov. J. Quantum Electron. (USA), vol.13, no.2, p.194-8 (Feb. 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.2, p.354-9 (Feb. 1983).
Theoretical and experimental studies were made of the characteristics of formation of the spatial structure of a high-power light beam emitted by a neodymium glass laser system. (20 refs.)

100826 Mode locking in a fiber laser. M.I.Dzhibladze, Z.G.Esiashvili, E.Sh.Teplitskii, S.K.Isaev, V.R.Sagaradze (State Univ., Tbilisi, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.2, p.245-7 (Feb. 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.2, p.432-4 (Feb. 1983).
An investigation was made of the time structure of giant pulses emitted by a neodymium glass-fiber laser. Partial mode locking occurred within some mode groups. An explanation of this effect is provided. (7 refs.)

100827 Influence of transit effects on frequency resonances in gas lasers. V.M.Ermachenko, A.S.Kurlyandskii (Engng. Phys. Inst., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.2, p.247-9 (Feb. 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.2, p.434-7 (Feb. 1983).
An investigation is made of the influence of the transit effects and of the wavefront curvature of a Gaussian mode on the characteristics of a frequency resonance of a linear gas laser with an intracavity absorption cell. It is shown that these effects do not shift a resonance from the central frequency of the spectral line of the gas cell relative to the neck of a Gaussian mode on the frequency resonance profile. (5 refs.)

100828 Experimental observation of amplification of beams by dynamic surface holograms. N.F.Pilipetskii, A.N.Sudarkin, V.V.Shkunov, V.V.Yakimenko (Inst. of Problems in Mech., Acad. of Sci., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.2, p.265-6 (Feb. 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.2, p.456-8 (Feb. 1983).
Amplification of the power of a laser beam in the course of self-diffraction by a dynamic surface hologram was observed experimentally. The gain reached 14 without signal distortion. This self-diffraction was accompanied by a strong reduction in the pulse duration. A beam of high directionality was amplified by the transfer of energy from a reference wave which was of low optical quality. Wavefront reversal was performed by the hologram surface and this was accompanied by a sevenfold increase in the brightness. (8 refs.)

100829 A discussion of the problem of determining multiple lifetimes from picosecond absorption recovery data as encountered in two carbocyanine dyes. V.Sundstrom, T.Gillbro (Div. of Phys. Chem., Univ. of Umea, Umea, Sweden).
Appl. Phys. B (Germany), vol.B31, no.4, p.235-47 (Aug. 1983).
Absorption recovery kinetics data on the picosecond time-scale of a high signal-to-noise ratio can be obtained by using continuously operating synchronously modelocked dye lasers. The authors show that such data make it possible to determine multiple exponential decays with small differences in rate constants. The authors also show that an absolute prerequisite to accomplish this is that the measurements are performed at a number of different wavelengths, and that the decays are monitored in a time interval corresponding to several lifetimes. These considerations are demonstrated by measurements on two carbocyanine dyes, DQOCI and pinacyanol, respectively. (19 refs.)

100830 Structure of scattered emission in scanning laser systems. A.A.Shishagin.
Izv. VUZ Priborostr. (USSR), vol.26, no.6, p.83-8 (June 1983). In Russian.
The process of the formation of the field scattered by an object in scanning laser systems is analysed from the standpoint of radio-optics and a block diagram is proposed which makes it possible to relate the spatial and time characteristics of the field in the spectrum splitting region. The relationship of the parameters of the system to the parameters of the corresponding modulators of the equivalent block diagram is given. (5 refs.) *L.M.H.*

100831 Laser systems for electronics manufacturing. P.M.Baker (Quantrad Corp., Torrance, CA, USA).
Wescon/80 Conference Record, Anaheim, CA, USA, 16-18 Sept. 1980 (El Segundo, CA, USA: Electron. Conventions 1980), p.22-2/1-7
Today in the electronics industry there are many different applications for laser-based equipment in the production process. From initial wafer marking and annealing through device welding to marking of stuffed circuit boards, lasers offer important advantages that companies in the electronics industry are exploiting to increase quality and/or production throughput of their products. There are three primary laser types used in electronics production today: Xe ion, YAG, and CO_2. Each has different properties and these largely dictate which laser is used for a given manufacturing process. (1 ref.)

42.65 NONLINEAR OPTICS

100832 Self-pulsing and chaos in acoustooptic bistability. J.Chrostowski, R.Vallee, C.Delisle (Dept. de Phys., Univ. Laval, Quebec City, Quebec, Canada).
Can. J. Phys. (Canada), vol.61, no.8, p.1143-8 (Aug. 1983).
The output of a hybrid acoustooptic bistable device with delayed feedback is investigated. Depending on the input intensity, such a system exhibits periodic and chaotic behaviour. Period doubling up to period-8 with the reverse Lorentz sequence is presented. The sequence of bifurcations is truncated by the additive electrical shot noise and the multiplicative noise due to the laser intensity fluctuations. Frequency locked oscillations are also presented. (21 refs.)

100833 Two-photon optical multistability. L.Fuli (Blackett Lab., Imperial Coll., London, England).
IEEE J. Quantum Electron. (USA), vol.QE-19, no.6, p.887-9 (June 1983). (8th IEEE International Semiconductor Laser Conference, Ottawa, Ont., Canada, 13-15 Sept. 1982).
The theory of two-photon optical bistability and multistability has been extended to include dispersive mechanisms and all Stark shift terms. The double bistability and tristability in the two-phonon processes has been studied. (6 refs.)

100834 Coherent effects in the generation and amplification of ultrashort pulses in YAG:Nd and ruby at low temperatures. O.P.Varnavskii, A.N.Kirkin, A.M.Leontovich, R.G.Mirzoyan, A.M.Mozharovskii, I.R.Sataev (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
JETP Lett. (USA), vol.37, no.5, p.271-4 (5 March 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.5, p.229-31 (5 March 1983).
Coherent effects during generation and amplification in YAG:Nd and ruby have been studied at ~100K for the first time. Intensity oscillations have been observed at the railing edge of the pulse. The spectrum has a doublet structure. The transverse relaxation time T_2 in ruby is estimated from the decay of the oscillations. (12 refs.)

100835 Observation of period doubling in an all-optical resonator containing NH_3 gas. R.G.Harrison, W.J.Firth, C.A.Emshary, I.A.Al-Saidi (Dept. of Phys., Heriot-Watt Univ., Edinburgh, Scotland).
Phys. Rev. Lett. (USA), vol.51, no.7, p.562-5 (15 Aug. 1983).
Two-round-trip-time modulation of the cavity field has been observed in a passive ring resonator, containing an ammonia cell, pumped by smooth 100-ns CO_2 laser pulses. The results are in excellent accord with the theory of Ikeda instability in a two-level system, which is generalized to include reservoir kinetics. (15 refs.)

100836 Chaos and nonlinear optics: a chaotic Raman attractor. P.W.Milonni, J.R.Ackerhalt, H.W.Galbraith (Theoretical Div., Los Alamos Nat. Lab., Los Alamos, NM, USA).
Phys. Rev. A (USA), vol.28, no.2, p.887-91 (Aug. 1983).
The authors consider a 'chaotic Raman attractor' as an example of the type of chaotic behavior that may occur in nonlinear optics. (14 refs.)

100837 Temporal aspects of absorptive optical bistability. T.Erneux, P.Mandel (Service de Chimie-Phys. II, Univ. Libre de Bruxelles, Bruxelles, Belgium).
Phys. Rev. A (USA), vol.28, no.2, p.896-909 (Aug. 1983).
The authors study the semiclassical mean-field theory of absorptive optical bistability in the limit of a fully developed hysteresis cycle, i.e. in the limit of large values of the bistability parameter *C*. The authors show by multiple time-scale perturbation analysis that it is possible to describe the transition between the two stable branches by simple equations. Near the low-transmission branch, the behavior of the system is governed by an equation for the atomic population, whereas, near the high-transmission branch, it is an equation for the field amplitude which determines the long-time evolution of the system. The authors then present an analytic study, completed by numerical results whenever necessary, of the time-dependent response of the system when the input field is swept across the bistable region. The authors study the

influence of the initial conditions, the sweeping velocity, and the ratio of the atomic relaxation times on the dynamical hysteresis as well as its relation with the stationary hysteresis. (21 refs.)

100838 Saturation of interband transitions in semiconductors and the effect of optical bistability. J.Goll, H.Haken (Phys. Inst. Theoretische, Univ. Stuttgart, Stuttgart, Germany).
Phys. Rev. A (USA), vol.28, no.2, p.910-28 (Aug. 1983).
Starting from a Hamiltonian which describes the interaction of the many-electron system of a crystal with the quantized light field, the authors derive nonlinear coupled equations of motion for the light-field amplitude, the electron-hole-pair amplitude, and the inversion. These equations yield the basis for the investigation of space-dependent nonlinear interaction effects between light and electrons in direct band-to-band transitions. With the aid of these equations the authors investigate the saturation behavior of direct band-to-band transitions for an incident monochromatic electromagnetic plane wave. The authors determine the nonlinear absorption coefficient and nonlinear refractive index. The authors compute the nonlinear transmissivity taking into account the boundary conditions at the end faces of the crystal and discuss the effect of optical bistability. (12 refs.)

100839 Analysis of biexcitonic optical bistability in CuCl in the presence of collision broadening. D.Sarid, N.Peyghambarian, H.M.Gibbs (Optical Sci. Center, Univ. of Arizona, Tucson, AZ, USA).
Phys. Rev. B (USA), vol.28, no.2, p.1184-6 (15 July 1983).
The dielectric function CuCl in the presence of biexciton formation that involves collision-broadening effects is analyzed in terms of incident photon energy and intensity. The authors discuss the nonlinear response of the material and its application to bistable devices. (20 refs.)

42.65B General theory

100840 Parametric interaction of oppositely propagating light waves of identical frequency. N.V.Tabiryan (Erevan State Univ., Erevan, USSR).
JETP Lett. (USA), vol.37, no.3, p.181-3 (5 Feb. 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.3, p.150-2 (5 Feb. 1983).
Waves of identical frequency in media exhibiting a reactive (nonabsorbing) nonlinearity may exchange energy with each other. The exchange results from a spatial modulation of the interfering light fields by the gyration vector of the magnetic medium. There is a threshold in the dependence of the gain on the wave power, the gain also depends on the deviation of the wave polarisation from circular. The gain reaches a maximum in the case of a linearly polarised intense wave and vanishes in the case of a circular polarisation. (3 refs.)

100841 Chaos in coherent two-photon processes in a ring cavity. S.Singh (Dept. of Phys., Univ. of Arkansas, Fayetteville, AR, USA), G.S.Agarwal.
Opt. Commun. (Netherlands), vol.47, no.1, p.73-6 (1 Aug. 1983).
The output of a ring cavity containing a resonant medium undergoing two photon transitions is shown to become chaotic, after following a series of bifurcations involving 2^n cycles, as the strength of the driving field is increased. The chaotic regime is followed by a sequence of period doubling bifurcations in reverse order. (14 refs.)

100842 Electromagnetic theory of diffraction in nonlinear optics and surface-enhanced nonlinear optical effects. R.Reinisch (Lab. de Genie Phys., Ecole Nat. Superieure d'Ingeniers Electriciens de Grenoble, Saint-Martin-d'Heres, France), M.Neviere.
Phys. Rev. B (USA), vol.28, no.4, p.1870-85 (15 Aug. 1983).
The authors present the first rigorous electromagnetic theory of diffraction in nonlinear optics. This theory allows the study of any type of nonlinear grating: bare or coated, whatever the groove depth and the profile of grating and coatings may be. The formalism developed here is derived from Maxwell's equations. The existence of the excitation and its nonlinear feature on the one hand, and the diffraction of the pump beams and of the signal on the other hand, are fully taken into account. The calculation reported here is valid for all cases of polarization (TM or TE) of the pump beams and of the signal. Two expressions of the nonlinear polarization at the signal frequency are derived. One is valid below the modulated region; the other one, inside this region. These two expressions take into account all the diffracted orders at the pump frequencies: propagating and evanescent. One then gets the expression of the electromagnetic field at the signal frequency everywhere: not only outside the modulated region but also inside it. The results thus obtained show that this electromagnetic field is a superposition of a diffracted field, with radiated and evanescent orders, and an infinite number of elementary driven waves. The authors also derive the nonlinear grating equation which allows the determination of the directions of propagation of the radiated diffracted orders. This is achieved using a new geometrical construction. It is shown that the evanescent diffracted orders at the signal frequency and at the pump frequencies can be resonantly excited. The rigorous feature of the electromagnetic theory developed allows one to get the following new and important result: there exists an optimal groove depth for which the electromagnetic resonance contribution to the enhancement of the nonlinear optical process is the strongest. These results can be applied to the study of different nonlinear optical processes, such as enhanced second-harmonic generation, surface-enhanced Raman scattering, Pockels effect, and optical rectification. (12 refs.)

42.65C Stimulated Raman, Brillouin and Rayleigh scattering; parametric oscillations and harmonic generation

100843 Nearly noncritically phase-matched UV generation at 3547 Å in $NaCHO_2$. K.Kato (First Res. Center, Japan Defense Agency, Tokyo, Japan).
IEEE J. Quantum Electron. (USA), vol.QE-19, no.6, p.893-4 (June 1983). (8th IEEE International Semiconductor Laser Conference, Ottawa, Ont., Canada, 13-15 Sept. 1982).
Sodium formate ($NaCHO_2$) has been found to be very nearly noncritically phase matchable for type-2 frequency mixing of the Nd:YAG laser fundamental and second-harmonic radiation at room temperature. The nonlinear optical constant was determined to be $d_{32}(NaCHO_2)=(1.25\pm0.25)\times10^{-9}$ ESU. (3 refs.)

100844 Generation of second harmonic of light in crystals with resonant impurities. B.Ya.Zel'dovich, S.D.Kuz'michev (Moscow Physicotech. Inst., Moscow, USSR).
JETP Lett. (USA), vol.37, no.2, p.103-5 (20 Jan. 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.2, p.85-6 (20 Jan. 1983).
A light wave induces an oscillating dipole moment in a resonant impurity; its field in the near zone exceeds the macroscopic field and second harmonic can be efficiently excited on the quadratic nonlinearity of the matrix. A calculation and estimates of the effect are given for the case in which the exciting wave propagates in the self-induced transparency regime. (3 refs.)

100845 Second-harmonic generation on reflection from a monomolecular Langmuir layer. O.A.Aktsipetrov, N.N.Akhmediev, E.D.Mishina, V.R.Novak (M.V. Lomonosov State Univ., Moscow, USSR).
JETP Lett. (USA), vol.37, no.4, p.207-9 (20 Feb. 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.4, p.175-6 (20 Feb. 1983).
The generation of the second harmonic on reflection of light from a monomolecular Langmuir layer (MLL) is observed for the first time. The component of the quadratic-susceptibility tensor $\chi_{yyy}^{(2)}=4.2\times10^{-8}$ esu is measured for an MLL of nitro-octadecylazobenzene. (10 refs.)

100846 Multicomponent doubled-frequency scattering excited in ZnSe by a single picosecond laser pulse. V.A.Zyul'kov, V.P.Gribkovskii (Inst. of Phys., Acad. of Sci., Belorussian SSR).
JETP Lett. (USA), vol.37, no.4, p.213-16 (20 Feb. 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.4, p.179-82 (20 Feb. 1983).
Multicomponent scattering at twice the laser frequency has been observed, for the first time, when ZnSe single crystals are pumped by a single picosecond first-harmonic pulse from a neodymium laser. (3 refs.)

100847 Selective nonlinear spectroscopy of inhomogeneously broadened phonon resonances in a disordered medium. T.T.Basiev, E.M.Dianov, E.A.Zakhidov, A.Ya.Karasik, S.B.Mirov, A.M.Prokhorov (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
JETP Lett. (USA), vol.37, no.4, p.229-33 (20 Feb. 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.4, p.192-5 (20 Feb. 1983).
Panoramic Stokes and anti-Stokes scattering spectra have been measured in glass fiber lightguides with biharmonic monochromatic pumping. The results can be used to develop tunable narrow-band subnanosecond sources which emit in the Stokes and anti-Stokes spectral regions with respect to thepump. An arrangement for a selective stimulated-Raman gain is discussed. This arrangement has yielded the first measurements of the homogeneous broadening ($\sim$16 cm^{-1}) of an inhomogeneously broadened phonon vibration ($\nu\approx$460 cm^{-1}) in amorphous SiO_2. (7 refs.)

100848 Tunable infrared difference-frequency generation in lithium iodate. L.Mannik, S.K.Brown (Ontario Hydro Res. Div., Toronto, Ontario, Canada).
Opt. Commun. (Netherlands), vol.47, no.1, p.62-4 (1 Aug. 1983).
Tunable infrared output has been produced by the difference-frequency mixing of 532 nm and dye laser radiation from a Nd:YAG-pumped dye laser in a crystal of $LiIO_3$. More than 100 μJ can be generated in a diffraction-limited beam from 3.5 to 4.2 μm and from 4.4 to 5.4 μm with a maximum energy of greater than 800 μJ at 3.8 μm. (11 refs.)

100849 Theory for selective-vibrational-dephasing experiments with the use of transient stimulated Raman scattering in high laser depletion. S.M.George, C.B.Harris (Dept. of Chem., Univ. of California, Berkeley, CA, USA).
Phys. Rev. A (USA), vol.28, no.2, p.863-78 (Aug. 1983).
A theory for selective-vibrational-dephasing experiments using transient stimulated Raman scattering in high laser depletion is presented. The transient stimulated Raman scattering equations are numerically solved including laser depletion for homogeneously and inhomogeneously broadened vibrational line shapes. A detailed account of the effects of low and high laser depletion on the vibrational amplitudes is given. An interpretation for excite-and-probe vibrational-dephasing experiments undertaken in the low- and high-laser-depletion regimes is developed. For a collinear laser probe pulse, high depletion of the excitation laser pulse leads to enhanced coherent Stokes probe scattering from one vibrational subgroup in the inhomogeneously broadened line shape. This selective scattering is greatly dependent upon the excitation laser pulse width and the off-resonance frequency of the vibrational subgroup. The enhanced selectivity in high laser depletion allows the homogeneous dephasing time T_2 to be measured to a high level of accuracy. (29 refs.)

100850 Symmetry analysis of second-harmonic generation in silicon. T.A.Driscoll, D.Guidotti (Phys. Dept., Brown Univ., Povidence, RI, USA).
Phys. Rev. B (USA), vol.28, no.2, p.1171-3 (15 July 1983).
The authors present observations of second-harmonic generation in Si and argue that under intense laser excitation inversion symmetry is broken, and dipolar bulk second-harmonic generation becomes possible. A mechanism is proposed for removing inversion symmetry in highly excited Si. (11 refs.)

100851 Nature of the instability associated with parametric excitation of acoustic waves by electromagnetic fields. A.L.Kalapusha, N.Ya.Kotsarenko (T.G. Shevchenko State Univ., Kiev, Ukrainian SSR).
Sov. Phys.-Acoust. (USA), vol.29, no.1, p.31-4 (Jan.-Feb. 1983). Translation of: *Akust. Zh. (USSR)*, vol.29, no.1, p.55-9 (Jan.-Feb. 1983).
The nature of the instability of acoustic waves in piezoelectric semiconductors is analyzed in the case of stimulated Mandel'shtam-Brillouin scattering and the nonlinear piezoelectric effect. The conditions for the onset of convective instability and the values of the gain in the presence of carrier drift are determined. (14 refs.)

100852 Generation of Stokes and anti-Stokes waves initiated by two-photon additional illumination. N.E.Kornienko, A.M.Steba, V.L.Strizhevskii (T.G. Shevchenko State Univ., Kiev, Ukrainian SSR).
Sov. J. Quantum Electron. (USA), vol.13, no.2, p.161-5 (Feb. 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.2, p.300-7 (Feb. 1983).
A theoretical analysis is made of the simultaneous generation of Stokes and anti-Stokes waves initiated by two-photon additional illumination. This is done allowing for Raman and parametric processes, saturation effects and also for a possible difference between the Raman polarizabilities for the Stokes and anti-Stokes waves. The conditions for the establishment of various asymptotic regimes are determined and general expressions are derived for the ultimate conversion efficiencies, assuming that pump and additional illumination are fed into a medium (inverted or uninverted) under exact resonance and phase-matching conditions. The spatial evolution of the amplitudes of the interacting waves is investigated by an accurate analytic solution of the problem in an important particular case and using solutions in the approximation of a constant pump wave or constant additional illumination. (6 refs.)

100853 Sum-frequency output of parametric thermal image upconversion with dispersion matching. K.Koyanagi, I.Sakuraba (Faculty of Engng., Hokkaido Univ., Sapporo, Japan).
Trans. Inst. Electron. & Commun. Eng. Jpn. Part C (Japan), vol.J66C, no.5, p.432-3 (May 1983). In Japanese.
Describes the sum-frequency output of parametric thermal image upconversion with dispersion matching. It is shown that the dispersion matching, in which case the spectral passband is large, is advantageous for thermal image upconversion. (5 refs.)

100854 Phase-conjugate wavefront generation in four-wave mixing with photorefractive $Bi_{12}GeO_{20}$ (BGO) crystals. Y.H.Ja (Telecom Australia Res. Labs., Melbourne, Australia).
Aust. Telecommun. Res. (Australia), vol.17, no.1, p.53-60 (1983).
Phase-conjugate wavefront generation by degenerate four-wave mixing experiments in a reflection geometry with photorefractive $Bi_{12}GeO_{20}$ crystals is reported. The phase volume hologram responsible for the phase-conjugate wavefront generation is a reflection hologram with a very small fringe spacing of about 0.26 μm. No external electric field is applied and electron diffusion is the main mechanism responsible for the formation of the hologram. The theoretical and experimental results for wavefront reflectivity as a function of the intensity ratio of the writing beams are given. The dependence of the modulation depth of the reflection hologram and its average value over the crystal on the absorption and the intensity ratio of the writing beams is investigated also. (28 refs.)

100855 Photolithography experiments using forced Rayleigh scattering. M.D.Levenson (IBM Res. Lab., San Jose, CA, USA).
J. Appl. Phys. (USA), vol.54, no.8, p.4305-13 (Aug. 1983).
Phase conjugate wavefront generation by degenerate four-wave mixing has been used to project images with spatial resolution greater than 500 line pairs per millimeter. The nonlinear medium, a solution of rhodamine 6G in acetone, produced the images of forced Rayleigh scattering. These images were bright enough to expose photoresist in 30 sec and their quality was adequate for fine-line lithography and consistent with theoretical expectations. (10 refs.)

100856 A class of self-time-reserving wave fields. W.D.Montgomery (La Jolla Inst., La Jolla, CA, USA).
Lett. Nuovo Cimento (Italy), vol.37, ser.2, no.13, p.472-6 (30 July 1983).
Shows that every vector homogeneous wave field is generated by a boundary field f, where $f=\phi+i\psi$ is a unique decomposition of f into its 'real' and 'imaginary' parts. These parts (ϕ and ψ) belong to a class (in fact, a real Hilbert space) of fields which when reflected from an ideal metallic mirror (MM) produce the same time-reversed wave field as when reflected from an ideal phase-conjugate mirror (i.e. they may be called self-time-reversing via a MM). (6 refs.)

100857 Elimination of distortions produced by a nonlinear medium by phase conjugation without losses or gains. G.S.Agarwal (School of Phys., Univ. of Hyderabad, Hyderabad, India).
Opt. Commun. (Netherlands), vol.47, no.1, p.77-8 (1 Aug. 1983).
A recently proved theorem on the complete cancellation of distortions, produced by a linear medium, using the technique of phase conjugation is generalized to a class of a nonlinear media. (4 refs.)

100858 Copropagation and counterpropagation conjugation with specular reflection. Yu.A.Ananev, V.D.Solovev.
Opt. & Spectrosc. (USA), vol.54, no.1, p.77-81 (Jan. 1983). Translation of: *Opt. & Spektrosk. (USSR)*, vol.54, no.1, p.136-43 (Jan. 1983).
Conjugation arrangements making use of a volume interaction of light beams accompanied by the formation of a wave with the difference phase distribution are discussed. Several properties of the conjugation process are determined not so much by the nature of the interaction as by the particular arrangement used. A self-cancellation of large-scale optical inhomogeneities of a nonlinear medium is described in an arrangement in which the wave to be conjugated and the reference beam are initially propagating in opposite directions. (16 refs.)

100859 Phase conjugation by degenerate four-wave mixing and temporal coherence. B.Crosigani (Fondazione Ugo Bordoni, Istituto Superiore Poste e Telecomuniocazioni, Roma, Italy), P.Di Porto.
Opt. Lett. (USA), vol.8, no.8, p.422-4 (Aug. 1983).
The influence of the temporal-coherence properties of the pump and signal waves on the efficiency and the temporal fidelity of the phase-conjugation process associated with degenerate four-wave mixing is examined. (7 refs.)

100860 Probe-beam intensity-dependent reflectivity in degenerate four-wave mixing in a saturable absorber. Jin Kyuk Kwon, Sang Soo Lee (Dept. of Phys., Korea Advanced Inst. of Sci. & Technol., Seoul, Korea).
Opt. Lett. (USA), vol.8, no.8, p.428-30 (Aug. 1983).
A degenerate four-wave mixing experiment is performed in the saturable absorber of cryptocyanine. When the pump-beam intensity is below the saturation intensity, the reflectivity of the probe beam does not change, even through the probe-beam intensity is increased; however, the reflectivity begins to decrease slowly for moderate pump-beam intensity and finally decreases $1/q$ (q is the ratio of probe-to-forward pump-beam intensity) for pump-beam intensity far above the saturation intensity. The results are explained by extending Kogelnik's coupled-wave theory of volume grating to the four-wave case. (13 refs.)

100861 Transient four-wave mixing and optical pulse compression in the femtosecond regime. J.G.Fujimoto, E.P.Ippen (Dept. of Electrical Engng. & Computer Sci., MIT, Cambridge, MA, USA).
Opt. Lett. (USA), vol.8, no.8, p.446-8 (Aug. 1983).
The transient behavior of parametric-scattering four-wave mixing is investigated experimentally with femtosecond laser pulses. Special emphasis is placed on the measurement of parametric pulse durations and the application of this process to the compression of femtosecond optical pulses. Compression factors up to 1.85 have been achieved, yielding high-power pulses of less than 40-fsec duration. (11 refs.)

100862 Phase conjugation in stimulated scattering. B.Ya.Zel'dovich, N.F.Pilipetskii, V.V.Shkunov (Inst. of Problems in Mech., Acad. of Sci., USSR).
Sov. Phys.-Usp. (USA), vol.25, no.10, p.713-37 (Oct. 1982). Translation of: *Usp. Fiz. Nauk (USSR)*, vol.138, no.2, p.249-88 (Oct. 1982).
Various aspects of optical phase conjugation are discussed: the properties of the conjugate wave, its potential applications, the basic conjugation methods, and a brief history of the question. The theory for phase conjugation in stimulated scattering is set forth in detail. The basic experimental results on this conjugation method are also discussed in detail. Phase conjugation occurs because that configuration of the back-scattered field which has the conjugate wavefront is amplified to the greatest extent (at a doubled gain) in the intense speckle-inhomogeneous conjugate wave in a medium in which stimulated scattering occurs. Because of the large overall amplification in stimulated scattering, all the other, uncorrelated, configurations of the spontaneously scattered nucleating waves are amplified by a factor of 10^7 less and are discriminated against. The intervals of values of the various parameters in which the conjugate configuration (the specklon) exists are discussed theoretically, as is the effect of nonlinear selection and saturation on phase conjugation in stimulated scattering. There is a review of experimental results on the first observation of the effect, on the measurement of the angular structure of the uncorrelated waves and of the extent to which they are discriminated against, on the phase fluctuations of the conjugate wave, on the conjugation of subthreshold and depolarized radiation, and on phase conjugation in stimulated scattering in focused beams and for other scattered-wave amplification mechanisms. (123 refs.)

100863 Spectral characteristics of light wave reversal in a nondegenerate four-wave interaction in a resonant medium. P.A.Apanasevich, A.A.Afanas'ev, S.P.Shvavyi (Inst. of Phys., Acad. of Sci., Belorussian SSR).
Sov. J. Quantum Electron. (USA), vol.13, no.2, p.157-60 (Feb. 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.2, p.294-300 (Feb. 1983).
An investigation is made of wavefront reversal of optical radiation in a nondegenerate four-wave interaction in a resonant medium. It is shown that for a pump intensity comparable with the saturation intensity of the absorption line of the resonant medium, the reversed wave spectrum has two side peaks positioned symmetrically relative to the central peak which corresponds to a degenerate interaction. These side peaks are attributable to regions of negative absorption (amplification) of weak radiation by the resonant medium situated in a high-power field of opposite pump waves. The dependences of the magnitudes and positions of these peaks on the pump intensity can be used to control the spectral and energy characteristics of the reflected radiation. The conditions for self-excitation of a reversing system based on resonant four-wave interaction are determined. In particular, the ranges of the pump intensity and the optical density of the resonant medium in which self-excitation of the reversing system may occur, are determined for a degenerate interaction. 100864 A new nonlinear Q-switch element$-$LiF:F_2^- crystal. Zhang Guifen, Shu Meidong, Chai Xijie (Shanghai Inst. of Optics & Fine Mech., Acad. Sinica, Shanghai, China).
Chin. Phys. (USA), vol.3, no.2, p.459-62 (April-June 1983).
A new non-linear Q switch is presented. It combines the advantage of electro-optical crystal and dye Q switches, and is a promising crystal for Q switching and mode locking. (2 refs.)

100865 Photoacoustic observation of third-order absorption in thallium halides at 1.06 μm. P.Horn, A.Schmid, P.Braunlich (Dept. of Phys., Washington State Univ., Pullman, WA, USA).
IEEE J. Quantum Electron. (USA), vol.QE-19, no.7, p.1169-72 (July 1983).
1.06 μm laser photoacoustic spectroscopy has been applied to studies of third-order multiphoton absorption in selected thallium halides. This readily detected bandgap crossing absorption is observed at laser fluences significantly below the n-on-one damage threshold. Its importance for modelling of high intensity effects in wide bandgap ionic crystals is discussed. (24 refs.)

100866 Multiple photon echoes in molecular iodine. H.Nakatsuka, S.Asaka, M.Tomita, M.Matsuoka (Dept. of Phys., Faculty of Sci., Kyoto Univ., Kyoto, Japan).
Opt. Commun. (Netherlands), vol.47, no.1, p.65-9 (1 Aug. 1983).
Backward multiple photon echoes have been realized in the X $^1\Sigma_g{}^+$-$B^3\Pi_{0u}{}^+$ transition of molecular iodine. The first and second excitation pulses were the second harmonic pulse trains of an actively mode-locked and *Q*-switched YAG laser, and the third excitation pulse was a single pulse from a nitrogen-laser pumped dye laser. After the third pulse multiple photon echo pulses were emitted in the opposite direction to the excitation pulse train. The modulation on the envelope of the multiple photon echoes was explained as the quantum beats originated from the hyperfine splittings of the echo levels. (15 refs.)

100867 Theory of self-induced transparency without the approximation of slowly varying amplitudes and phases. A.I.Maimistov (Engng. Phys. Inst., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.2, p.198-200 (Feb. 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.2, p.360-4 (Feb. 1983).
An analysis is made of the propagation of an ultrashort optical radiation pulse under conditions of inhomogeneous broadening of a resonance line. By dispensing with the approximation of a slowly varying complex pulse envelope, constraints on the duration are removed and any phase modulation is automatically taken into account. It is shown that if the boundary conditions determining the attenuation of the pulse at its leading edges are defined, the appropriate reduced Maxwell-Bloch equations can be integrated using the method of the inverse problem of scattering theory. Higher conservation laws, whose existence has been doubted, are found. (15 refs.)

(for microscopes, see 07.60P; for photographic instruments, see 07.68; for astronomical telescopes, see 95.55)

100870 Studies on certain modified Luneberg lenses. M.Barakat (Industrial Technol. Centre, Nat. Res. Council of Canada, Winnipeg, Manitoba, Canada), L.Shafai.
IEE Proc. H (GB), vol.130, no.5, p.363-8 (Aug. 1983).
The solution for the electromagnetic field in the presence of certain modified Luneberg lenses is obtained analytically. The permittivity profiles are selected to improve the lens directivity at low frequencies, where the lens diameter is of the order of the wavelength. For a Huygens' source excitation their directivity, as a function of profile parameters, is computed and the degree of improvements are indicated. Radiation patterns are also computed and are compared with those of the standard Luneberg lens. To examine their performance with a practical source an open ended rectangular waveguide is then used and the computed radiation patterns are presented. In the latter case, to simplify computation, the exciting waveguide is represented by a two-dimensional Huygens' source array. (4 refs.)

100871 General solution of the non-full-aperture Luneburg lens problem. S.Doric, E.Munro (Dept. of Phys., Imperial Coll., London, England).
J. Opt. Soc. Am. (USA), vol.73, no.8, p.1083-6 (Aug. 1983).
The generalised Luneburg lens problem has been redefined to include non-full-aperture lenses, and as a result a new class of solutions has been made possible. A particular solution is obtained for which the refractive-index gradient is a smooth and continuous function and its two-dimensional form is equivalent to Sottini's geodesic lens with smooth edges. (7 refs.)

24th Midwest Symposium on Circuits and Systems, Albuquerque, NM, USA, 29-30 June 1981 (North Hollywood, CA, USA: Western Periodicals 1981), p.305-12
Presents the design of a digital control system for an advanced optical tracker which was recently tested in the laboratory and in the field. A brief description of the tracker which uses phase conjugate adaptive optics for correcting optical aberrations in the wavefront is presented. Models are given for the major system components, which include an optical sensor, a high bandwidth steering mirror and a high bandwidth deformable mirror. Finally, the digital control algorithm is described. (9 refs.)

100876 **Optimization of Schlieren apparatus parameters.** V.I.Gorodetskaya, R.P.Kosoburd, F.A.Markus.
Opt. & Spectrosc. (USA), vol.54, no.1, p.95-8 (Jan. 1983). Translation of: *Opt. & Spektrosk. (USSR)*, vol.54, no.1, p.167-72 (Jan. 1983).
The article discusses the optimum parameters of a Schlieren apparatus for the hairline-at-the-focus method from the standpoint of maximum contrast of the shadowgram and correct determination of the phase profile from its image. The errors of the method of reconstructing the phase relief shape are estimated. (5 refs.)

100877 **Theoretical investigations on spatial filtering with a complex binary filter under the condition of finite filter size.** S.Kessler, V.Masurat (Friedrich-Schiller-Univ., Jena, Germany).
Exp. Tech. Phys. (Germany), vol.31, no.3, p.193-211 (1983). In German.
The intensity distribution on the output of a spatial filtering system with a complex binary filter of finite size is considered. The special cases schlieren-method, phase contrast, and modulation contrast are discussed for a binary amplitude and phase object. (5 refs.)

100878 **Phase coding of complex space-frequency filters.** E.F.Ochin.
Izv. VUZ Priborostr. (USSR), vol.26, no.6, p.80-2 (June 1983). In Russian.
A space-frequency phase filter for a coherent optical processor is examined. The filter is a plane-parallel transparent substrate divided up into rectangular sections. Part of the material of the substrate is etched in such a way that there is a depression or protrusion, off-set from the centre of the section, inside the filter section. The magnitude of the depression or protrusion determines the phase difference, equal to π, its dimensions in the plane are proportional to the magnitude of the amplitude modulation and the displacement of the depression or protrusion relative to the centre of the filter section is proportional to the magnitude of the phase modulation of the filter in that section. 100879 **Design of ripple-free multilayer optical filters. A practical illustration.** K.Kannan, R.Balasubrahmaniyam (Dept. of Electrical Engng., Indian Inst. of Technol., Bombay, India).
Opt. Acta (GB), vol.30, no.8, p.1151-70 (Aug. 1983).
A simple and fast method of designing ripple-free, broad-band, thin-film edge filters is presented. It uses a successive refinement procedure for ripple reduction without any special merit functions, and a fast computational algorithm for finding the derivative of reflectance. The design of cyan and yellow broad-band edge filters is taken as an example to illustrate the procedure. The influence of various parameters in the ripple reduction process is analysed. The choice of these parameters at various stages of refinement to obtain a fast-converging solution is indicated. The effect of practical errors in controlling the thickness of the layers on the final product is also studied. The method illustrated can readily be used for the design of any broad-band edge filter and may be extended for other types of multilayer filter. (18 refs.)

100880 **Synthesis of contrast bandpass interference filters. Complex periodic systems.** Yu.N.Markov.
Opt. & Spectrosc. (USA), vol.54, no.1, p.99-102 (Jan. 1983). Translation of: *Opt. & Spektrosk. (USSR)*, vol.54, no.1, p.173-9 (Jan. 1983).
The article proposes a method of transmission-band iosolation that makes it possible over a wide range of given bandwidth values to synthesize contrast bandpass interference filters whose spectral characteristics cannot be shaped with sufficient accuracy by using known categories of two-component multihalfwave bandpass systems. A method is proposed for optimizing bandpass interference filters in the smoothing portion of oscillations of the transmission coefficient in the transmission band. (10 refs.)

100881 **Characteristic curve of meteoric spectrograms obtained by an optical diffraction transmission grating.** A.Skopal (Inst. of Astron., Charles Univ., Praha, Czechoslovakia).
Bull. Astron. Inst. Czech. (Czechoslovakia), vol.34, no.3, p.173-8 (June 1983).
Relations determining the percentage representation of the light reflected by a grating are derived. To construct the characteristic curve of a plate, zero order spectra of star trails were used. The stellar magnitudes of star trails on the plate were derived from their theoretical magnitudes corrected for the speed of the stars on the plate and for the effect of the diffraction transmission grating with a triangular scratch cross-section. A numerical example is also given. (6 refs.)

100882 **New vistas for diffraction gratings.** J.M.Lerner (Optical Div., Instruments SA Inc., Metuchen, NJ, USA), J.-P.Laude.
Electro-Opt. (USA), vol.15, no.5, p.31-5 (May 1983).
The development and performance of holographically produced ion-etched diffraction gratings is discussed. The use of fibre optics with gratings is described including the Stimax configuration and Schmidt-corrected gratings. The resulting development of communication systems and new forms of spectroscopic devices is discussed. Finally the use of gratings in metrology is considered. (12 refs.)

100883 **Calculation of electro-optical diffraction deflector with edge effects taken into account.** V.A.Dianova, Ye.R.Mustel', A.G.Sveshnikov, N.Ye.Shapkina.
Radio Eng. & Electron. Phys. (USA), vol.27, no.10, p.140-5 (Oct. 1982). Translation of: *Radiotekh. & Elektron. (USSR)*, vol.27, no.10, p.2016-21 (Oct. 1982).
The behaviour of an electro-optically controlled 'blazed' grating type of deflection system is investigated with the edge effects at the electrode boundaries taken into account. The phase delay and the distribution of light intensity among the diffraction maxima are calculated. (5 refs.)

(for fibre optical waveguides, see 42.80M)

100884 **Graphical representation of prism coupling into thin films.** A.Feldman (Inorganic Materials Div., NBS, Washington, DC, USA).
Appl. Opt. (USA), vol.22, no.15, p.2380-2 (1 Aug. 1983).
A natural framework for evaluating prism-coupler performance is provided by a recently developed geometrical construction in which refraction through a prism for an arbitrary angle of incidence is represented by an ellipse. The useful operatinmg range of a prism coupler is represented by the portion of the representational ellipse that appears within a window determined by the mode propagation conditions of a thin-film-substrate system. (7 refs.)

100885 Passive planar multibranch optical power divider: some design considerations. M.Belanger, G.L.Yip (Dept. of Electrical Engng., McGill Univ., Montreal, Quebec, Canada), M.Haruna.
Appl. Opt. (USA), vol.22, no.15, p.2383-9 (1 Aug. 1983).
Design analysis has been performed on a passive planar multibranch waveguide optical power divider in a z-cut $LiNbO_3$ substrate. Specifically, 5- and 3-branch waveguide structures were investigated with the effective index and field matching methods, taking into account the phase changes in the branches at the branching interface. Conditions for equal power division were examined regarding the appropriate branching angle and the relative index distribution in the branches. Illustrative numerical examples are presented and discussed. (16 refs.)

100886 Integrated optical polariser on $LiNbO_3$:Ti channel waveguides using proton exchange. M.Papuchon, S.Vatoux (Lab. d'Optique Integree, Thompson-CSF, Orsay, France).
Electron. Lett. (GB), vol.19, no.16, p.612-13 (4 Aug. 1983).
A polariser on a Ti:$LiNbO_3$ channel waveguide has been realised using a double fabrication process (Ti indiffusion and proton exchange). A region is created where the extraordinary polarisation experiences a leaky propagation leading to an extinction ratio of 30 dB and excess loss of about 1 dB. (7 refs.)

100887 Microbending loss in optical waveguides. J.M.Arnold, R.Allen (Dept. of Electrical & Electronic Engng., Univ. of Nottingham, Nottingham, England).
IEE Proc. H (GB), vol.130, no.5, p.331-9 (Aug. 1983).
The problem of coupling from a bound mode to the radiation field in an open waveguide subject to slow variations of its axis is considered. The derivation does not depend on statistical averaging over an ensemble of waveguides, as do earlier treatments of the same problem. Nevertheless, it is shown that an average loss can be defined, and the average being taken over the length of the waveguide. For this reason, the results are applicable to the realistic experimental situation, when experiments are performed on single waveguides. As an example, the authors calculate the microbending loss of a single-mode step-index optical fibre as a function of wavelength and compare it with some recent experimental measurements of the same quantity. Good agreement is shown when the Fourier transform of the curvature autocorrelation function is assumed to have an inverse power dependence on the Fourier frequency, but the agreement is less convincing for some other possible choices of autocorrelation function. (13 refs.)

100888 Carrier dependent parameters in a silicon optical waveguide. M.Willander (Phys. Dept., Royal Inst. of Technol., Stockholm, Sweden).
J. Appl. Phys. (USA), vol.54, no.8, p.4660-3 (Aug. 1983).
The infrared absorption (at $\lambda=10.63$ μm) of an electron-hole plasma, created in a thin silicon waveguide by intermittent electron beam bombardment, is measured experimentally and analyzed theoretically. In the absence of all external fields (except those of the probing laser beam) the imaginary dielectric constant is shown to be a linear function of the carrier concentration in the range 2×10^{22}-2×10^{23} m^{-3} at room temperature. Furthermore, it is shown that the method can be used to study the possible carrier dependence of either the carrier lifetime or the surface recombination velocity. (15 refs.)

100889 Lightwaveguide—operational line for 34 Mbit/s. G.Heister, W.Knop, W.Unterlass.
Nachrichtentech. Z. (NTZ) (Germany), vol.36, no.7, p.434-7 (July 1983). In German.
After trials in various cities from 1978 onwards, Siemens have handed over to the Federal German Post Office a 8.7 km long cable network in Munich; its capacity is 34 Mbit/s. The operating wavelength has been shifted from 850 to 880 nm, resulting in a 15% loss reduction, now down to 2.5 db/km. The glass fibre conductor has core/sheath diameters of 50 μm/125 μm. The transmitter module contains a CW laser in the shape of a planer GaAl/As oxide strip, the receiver is headed by a avalanche photodiode. Terminals contain special fault-locating circuits. A table quotes planned and actually achieved (better) performance figures of the glass fibre cable and of the whole transmitting system. Illustrations comprise electrical and optical response curves and 5 photos. (4 refs.) *A.L.*

100890 Evaluation methods for pulse measurement of lightwaveguides. S.Geckeler.
Nachrichtentech. Z. (NTZ) (Germany), vol.36, no.7, p.442-5 (July 1983). In German.
The measurement of the most important lightguide characteristics like attenuation and bandwidth is best undertaken by applying a very brief light pulse (typically <1 ns) and interpreting the output pulse deformation. This contribution from the Siemens Research Laboratories deals not with the equipment side but with mathematical analysis and with computerized evaluation of observed measurement results, a 4.4 km long glass fibre cable being pulsed and the pulse output waveform being measured in 0.25 ns steps. The analysis considers the normalized spectral function and the transmission characteristic function of the light guide, the theoretical case of a Dirac pulse being a limit condition. Diagrams show the applied pulse and the derived function responses from same: spectral function and phase angle plotted vs. frequency. Of particular interest is the short computer program in BASIC demonsrating the rapid evaluation of the basic perfomance characteristics from observed pulse measurements. (5 refs.) *A.L.*

100891 Optical soliton-like surface phenomena. H.-E.Ponath, M.Schubert (Dept. of Phys., Friedrich-Schiller-Univ. Jena, Jena, Germany).
Opt. Acta (GB), vol.30, no.8, p.1139-49 (Aug. 1983).
The properties of an optical pulse propagating along a diclectric or metallic surface is studied. Soliton-like behaviour and self-induced transparency are found, depending on the properties and geometric conditions of a dopant layer and of homogeneously doped material. (9 refs.)

100892 Chalcogenide amorphous film waveguides. T.Suhara, H.Nichihara (Faculty of Engng., Osaka Univ., Osaka, Japan).
Oyo Buturi (Japan), vol.52, no.3, p.233-4 (March 1983). In Japanese.
As-S of As-Se-Ge based chalcogenide-materials are used to fabricate chalcogenide amorphous thin-film optical waveguides. These materials have high forbidden-band energy. The use of a silicon substrate on which a SiO_2 layer is grown can provide excellent waveguide property. In this case, if the thickness of the SiO_2 layer is equal to 0.4 μm, device emission loss can be reduced to 0.1 dB/cm or less. The propagation loss of waveguide light is caused by scattering due to incompleteness of the surface of the substrate and waveguiding-film. An $As_2S_3/SiO_2/Si$ waveguide of 1 μm in thickness has shown a relative scattering intensity of approximately −20 dB when $\lambda=1.06$ μm and the propagation distance is 10 mm. (8 refs.) *K.B.*

100893 Mismatch of TE and TM modes in multilayer dielectric and metal-dielectric heterostructures. V.G.Fedoseev, P.V.Adamson (Inst. of Phys., Acad. of Sci., Tartu, Estonian SSR).
Sov. J. Quantum Electron. (USA), vol.13, no.2, p.228-32 (Feb. 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.2, p.408-15 (Feb. 1983).
A theoretical investigation is made of the mismatch between orthogonal modes (i.e. the relative difference between the refractive indices of guided TE and TM modes characterized by the same frequency and transverse index) propagating in four- and five-layer planar waveguides. An approximate expression is obtained for the mismatch between orthogonal modes in a five-layer waveguide characterized by relatively small discontinuities of the permittivity at the interfaces between the media and by relatively thick intermediate layers. It is shown that when an outer metal layer is deposited on a three-layer dielectric planar waveguide, the direction of change in the mismatch between orthogonal modes depends on the sign of the difference between the refraction indices of a guided TM mode in a three-layer waveguide and a surface plasmon traveling along the interface between the metal and an intermediate layer. If this difference between the refractive indices is positive, then matching of orthogonal modes is possible. The presence of a dielectric outer layer which is optically less dense that the intermediate one increases the mismatch between orthogonal modes. Subject to the assumptions made, the conclusions reached apply also to heterolasers with limited-thickness emitters. (11 refs.)

100894 Image transmission characteristics of dielectric slab with gradient index. T.Hosono, S.Yamaguchi, K.Mori (Coll. of Sci. & Technol, Nihon Univ., Tokyo, Japan).
Trans. Inst. Electron. & Commun. Eng. Jpn. Part C (Japan), vol.J66C, no.5, p.416-23 (May 1983). In Japanese.
Analyses the image transmission characteristics of dielectric slab waveguide (DSW) as a simplified model for image transmission in optical fibers. The transmission characteristics of DSW were numerically analyzed by using the homogeneous multilayer approximation method for the following items: (1) Difference of the characteristics between two dielectric constant profiles, $\mathrm{sech}^2(\alpha z)$ and $1-(\beta z)^2$, and effect of dielectric constant difference between core and cladding. (2) Aberration attributed to the profile of dielectric constant. (3) Effect of dip at edge of core. (10 refs.)

100895 Synchronous phase detection for optical fiber interferometric sensors. I.J.Bush, R.L.Phillips (Dept. of Electrical Engng. & Communication Sci., Univ. of Central Florida, Orlando, FL, USA).
Appl. Opt. (USA), vol.22, no.15, p.2329-36 (1 Aug. 1983).
A system has been developed to accurately detect phase signals produced in optical interferometric sensors. The system employs optical heterodyning and synchronously detects optical phase by feeding an error signal to a phase modulator in the reference leg of the interferometer. This system is seen to have properties similar to a phase-locked loop. The system is mathematically analyzed and a simple second-order model developed with accurately predicts the system response. (10 refs.)

100896 Launching light from semiconductor lasers into plane-ended multimode optical fibers. H.R.D.Sunak, M.A.Zampronio (Inst. de Fisica, Univ. Estadual de Campinas, Campinas, Sao Paulo, Brazil).
Appl. Opt. (USA), vol.22, no.15, p.2337-43 (1 Aug. 1983).
A systematic and detailed study of launching light from semiconductor lasers into plane-ended multimode optical fibers has been carried out—the authors believe for the first time. Three different semiconductor lasers and four multimode fibers having numerical apertures in the 0.16-0.40 range were used. Simple theoretical models developed for the launching efficiency η give good agreement with experimental results. The authors show how erroneous results can be obtained when considering only the stimulated emission of the lasers in calculating η. The dependence of η on axial, lateral, and angular misalignments is also investigated and explained qualitatively with ray optics. (7 refs.)

100897 Launching light from semiconductor lasers into multimode optical fibers having hemispherical ends and taper-with-hemisphere ends. H.R.D.Sunak, M.A.Zampronio (Inst. de Fisica, Univ. Estadual de Campinas, Sao Paulo, Brazil).
Appl. Opt. (USA), vol.22, no.15, p.2344-8 (1 Aug. 1983).
The plane ends (PE) of various multimode optical fibers have been transformed into (a) hemispherical ends (HE) and (b) taper-with-hemisphere ends (TE) by using a microtorch and also a CO_2 laser for HE only. The authors confirmed that the launching efficiency η from semiconductor lasers into multimode fibers is much greater than TE and HE compared with PE, with TE being the most efficient. A rigorous comparison between these three launching arrangements is reported here for the first time together with detailed analysis of similar published work. The effect of various misalignments is also investigated and compared for the three fiber terminations. (22 refs.)

100898 Influence of mode coupling on differential mode delay. B.Stoltz, D.Yevick (Inst. of Optical Res., Royal Inst. of Technol., Stockholm, Sweden).
Appl. Opt. (USA), vol.22, no.15, p.2349-55 (1 Aug. 1983).
The manner in which the differential mode delay (DMD) pulse response is affected by ellipticity and micro-bending induced mode coupling has been

analyzed numerically. The authors have considered both a fiber profile containing a central index dip and fiber profiles with sinusoidal ripples. The authors find that slowly varying profile components can be correctly estimated from DMD results even in the presence of substantial mode coupling. (7 refs.)

100899 Excess loss of single-mode jacketed optical fiber at low temperature. T.Yabuta, N.Yoshizawa, K.Ishihara (Ibaraki Electrical Communication Lab., NTT, Ibaraki, Japan).
Appl. Opt. (USA), vol.22, no.15, p.2356-62 (1 Aug. 1983).
This paper describes excess loss of single-mode jacketed optical fibers at low temperature. A structural model is proposed for the jacketed fiber in order to investigate the relationship between the structure and excess loss. This model clarifies the excess loss increase mechanism that any initial irregularity existing in the jacketed fiber increases due to shrinkage of the jacket and causes excess loss. These results show that reducing the buffer diameter and controlling the fiber deformation inside the jacket are effective in suppressing excess loss at low temperature. (7 refs.)

100900 Dispersionless single-mode fibers with trapezoidal-index profiles in the wavelength region near 1.5 μm. U.C.Paek (Western Electric Engng. Res. Center, Princeton, NJ, USA).
Appl. Opt. (USA), vol.22, no.15, p.2363-9 (1 Aug. 1983).
The transmission performance of trapezoidal-index profile single-mode fibers that can operate with zero dispersion in the 1.5-μm region has been investigated. The exact numerical calculations of propagation characteristics for these lightguides established a variety of relationships in terms of the parameters of a trapezoidal-index profile. One of the profile parameters that defines the shape of a trapezoid is the aspect ratio S, which ranges between 0 and 1. It was found that as the aspect ratio decreases from 1.0 to 0.3 the optimum core radius of the fiber gradually increases. But when S is <0.3, it approaches a constant equal to the value of the triangular-index profile ($S=0$). (16 refs.)

100901 Polarization-maintaining optical fibers with low dispersion over a wide spectral range. K.Okamoto, M.P.Varnham, D.N.Payne (Dept. of Electronics, Univ. of Southampton, Southampton, England).
Appl. Opt. (USA), vol.22, no.15, p.2370-3 (1 Aug. 1983).
The total dispersion characteristics of the doubly clad Panda (or bow-tie) fibers have been investigated. It is shown that the contribution of the photoelastic effect to the total dispersion becomes of the order of several psec/km.nm in the 1.5-1.7-μm wavelength region. By careful adjustment of the cutoff wavelength, the total dispersion is reduced to within ±1 psec/km.nm over the 1.38-1.70 μm wavelength region for the $HE_{11}{}^{x}$ mode and 1.38-1.68 μm for the $HE_{11}{}^{y}$ mode respectively. (16 refs.)

100902 Thermal properties of highly birefringent optical fibers and preforms. A.Ourmazd, M.P.Varnham, R.D.Birch, D.N.Payne (Dept. of Electronics, Univ. of Southampton, Southampton, England).
Appl. Opt. (USA), vol.22, no.15, p.2374-9 (1 Aug. 1983).
Temperature cycling of high birefringent optical fibers and preforms has been used to investigate the thermal properties of bow-tie and elliptically clad structures. The thermal hysteresis of the birefringence is shown to be a direct consequence of the thermal history of the fiber or preform and has been related to volume changes in the stress-producing borosilicate sections. Annealing increases the axial stress as well as the stress anisotropy and hence the birefringence. Increases of up to a factor of 2 in the birefringence on suitable thermal treatment indicate a new method for further improvement of high birefringence fibers. The implications of the results in the design, fabrication, and use of such fibers are discussed. (11 refs.)

100903 Glass fiber manufacturing: continuous purification of lightguide chemicals. D.L.Flamm, L.T.Manzione, J.W.Baumgart (Western Electric, Princeton, NJ, USA), L.F.Thompson.
Bell Lab. Rec. (USA), vol.61, no.5, p.17-21 (May-June 1983).
A new processing technique promises an unprecedented purity in the chemicals used to make lightguide fibers. The process also can be scaled up to meet increased production needs. (no refs.)

100904 Polarisation-holding directional coupler made from elliptically cored fibre having a D section. R.B.Dyott, J.Bello (Andrew Corp., Orland Park, IL, USA).
Electron. Lett. (GB), vol.19, no.16, p.601 (4 Aug. 1983).
A polarisation-holding directional coupler has been made using single-mode fibre having an elliptical core. An isolation of 21 dB between polarisation has been achieved together with an estimated insertion loss <0.2 dB. (2 refs.)

100905 New absorption bands in pure and F-doped silica optical fibres. W.Heitmann (Forschungsinst. der Deutschen Bundespost beim FTZ, Darmstadt, Germany), H.U.Bonewitz, A.Muhlich.
Electron. Lett. (GB), vol.19, no.16, p.616-17 (4 Aug. 1983).
Two very narrow absorption bands positioned at 765 nm and at 1273 nm have been found in pure silica and fluorine-doped silica optical fibres. Their origin is probably connected with the preform production technique. Annealing of the preform and different fibre drawing conditions did not influence the absorption bands. (3 refs.)

100906 Radiation-hardened pure silica-core fibre optics. R.H.West, A.P.Lenham (Royal Military Coll. of Sci., Swindon, England).
Electron. Lett. (GB), vol.19, no.16, p.622-3 (4 Aug. 1983).
Transmission losses induced by ionising radiation in fibre optics having cores drawn from pure synthetic silica may be reduced by pre-exposure to large hardening doses. Characteristics of the hardened fibres are described and the necessary features of the hardening irradiations identified. (3 refs.)

100907 Effects of loss on equivalent-step-index fibre determination. C.Pask, F.Ruhl (Res. School of Phys. Sci., Australian Nat. Univ., Canberra, Australia).
Electron. Lett. (GB), vol.19, no.16, p.643-4 (4 Aug. 1983).
The effects of waveguide losses on equivalent-step-index (ESI) determination are investigated with Millar's method (see ibid., vol.17, no.13, p.458-60, 1981) as an example. The fitting of spot-size data when the second-mode cutoff wavelength is underestimated leads to the use of an inappropriate formula or the deduction of a too-small ESI radius. In the latter case the ESI numerical aperture will still be given with good accuracy. (5 refs.)

100908 Fiberoptic receiver performance. A tutorial review. H.Hodara (Tetra Tech. Inc., Pasadena, CA, USA).
Fiber & Integrated Opt. (USA), vol.4, no.3, p.233-337 (1983).
A tutorial review of fiberoptic receivers is presented, and their performance analyzed in terms of two quantities: quantum noise, a fundamental limit, and Noise Equivalent Power, or NEP, and engineering parameter. The NEP, a quantity specified by manufacturers as constant, is shown to vary with bandwidth (data rate). The exact dependence of NEP on bandwidth is derived for two types of receivers: transimpedance and integrating, in both analog and digital modes. The results are applied to the calculation of the minimum required power for digital and analog receivers operation, and universal curves of power vs. bandwidth are presented. It is shown that the NEP specified by manufacturers can be fitted to these universal curves, from which receiver performance can be predicted. For tutorial purposes, the treatment is self-contained and many well-known classical results such as signal-to-noise ratio of PCM signals and noise-equivalent circuits are re-derived from fundamental principles. (no refs.)

100909 Optical properties of fibre and bulk zirconium fluoride glass. K.H.Levin, D.C.Tran, R.J.Ginther, G.H.Sigel,Jr. (Naval Res. Lab., Washington, DC, USA).
Glass Technol. (GB), vol.24, no.3, p.143-5 (June 1983). (Symposium on Halide and other Nonoxide Glasses, Cambridge, England, 23-26 March 1982).
Substantial lengths of both clad and unclad fibres of zirconium fluoride based glass have been produced. The clad fibres were pulled from a preform rod and had a relatively large numerical aperture of 0.20, which was achieved by adding PbF_2 to the base glass composition. In order to obtain a better understanding of the loss mechanisms of the fibres, the optical properties of both the fibre and bulk glass were measured. These properties include the refractive index, absorption and scattering in bulk samples, total loss and scattering loss spectra of the fibres, and radiation effects. The measurements indicate that the relatively high loss of the fibres is due mainly to scattering and water impurity. However, the scattering loss of the bulk samples was found to be very low and showed a dependence upon λ^{-4}. It is believed that better temperature control during the drawing of the fibres and a greater degree of purification of the starting materials will result in low loss fibres. Irradiation of the bulk samples produced a shift of the ultraviolet edge but no change in the infrared transmission was observed for doses up to 10^7 rad, indicating a potentially good resistance to radiation. (10 refs.)

100910 Preliminary calculations on dispersion effects in infrared transmitting materials. K.C.Byron, J.R.Gannon (Dept. of Optical Waveguide, Standard Telecommunication Labs. Ltd., Harlow, England).
Glass Technol. (GB), vol.24, no.3, p.146-8 (June 1983). (Symposium on Halide and other Nonoxide Glasses, Cambridge, England, 23-26 March 1982).
A variety of heavy metal fluoride glasses are currently being investigated with a view to fabricating high performance optical fibre systems. In order to assess the bandwidth potential of these fibres, a computer model of fibre dispersion has been developed in which accurate calculations of the material, waveguide, profile, and total dispersions are made over a broad wavelength range from information on the refractive index variation with wavelength in these glasses. Predictions are also made of the range of choice available in refractive index difference and core diameter to give zero total dispersion at particular wavelengths in practical fibres made with these materials. (4 refs.)

100911 Chalcogenide glass optical fibres. J.P.Parant, C.le Sergent, D.Guignot, C.Brehm (Labs. de Marcoussis, Centre de Recherches de la CGE, Marcoussis, France).
Glass Technol. (GB), vol.24, no.3, p.161-3 (June 1983). (Symposium on Halide and other Nonoxide Glasses, Cambridge, England, 23-26 March 1982).
Chalcogenide glasses have been drawn into fibres with attenuations of 5 dB/m at 7μm and 10 dB/m at 10.6 μm. Ultraviolet cured expoxy-acrylate and polyolefin coatings have been used to improve their mechanical properties. Two glass compositions have been investigated, $As_{15}Ge_{30}Se_{55}$ and $As_{13}Ge_{30}Se_{27}Te_{30}$. The influence of the composition and the purity of the glasses on the fibre losses in the range 6-12 μm is reported. (8 refs.)

100912 Fluorozirconate glasses with improved viscosity characteristics for fibre drawing. D.C.Tran, R.J.Ginther, G.H.Sigel (Naval Res. Lab., Washington, DC, USA).
Glass Technol. (GB), vol.24, no.3, p.169-71 (June 1983). (Symposium on Halide and other Nonoxide Glasses, Cambridge, England, 23-26 March 1982).
An attempt has been made to extend the range between the glass transition, T_g and the temperature, T_x, at which the glass crystallises on heating, and to manipulate the viscosity-temperature profile with the additions of selected fluoride dopant materials. (4 refs.)

100913 Dispersion characteristics of monomode optical-fibre systems. M.J.Bennett (Res. Labs., CEC, Wembley, England).
IEE Proc. H (GB), vol.130, no.5, p.309-14 (Aug. 1983).
The theory of dispersion in monomode fibres is considered giving formulas for the pulse response of an optical monomode fibre system in terms of source spectral width and centre frequency and first- and second-order dispersion parameters for the fibre. Generally, source spectral width is much larger than signal bandwidth, in which case a simple linear response function may be derived. For such systems calculations of bandwidth and pulse response are given for some typical values of source and fibre parameters. The measurement of the monomode fibre parameters is also considered. (33 refs.)

100914 Statistical properties of modal noise in fibre-laser systems. B.Crosignani, A.Yariv (Dept. of Appl. Phys., California Inst. of Technol., Pasadena, CA, USA).
J. Opt. Soc. Am. (USA), vol.73, no.8, p.1022-7 (Aug. 1983).
The direct analysis in the time domain of the fluctuations of a signal propagating in a fiber-optic link in the presence of an imperfect connector makes it possible to formalize in a simple manner the description of its statistical properties. This permits, in particular, the clarification of the role played by the various time scales involved in the problem (coherence time of the fiber-exciting source, fiber modal delay, detector response time, etc.) in evaluating the statistical averages. The formalism includes in a straightforward way the case of simultaneous excitation of the fiber by more than one source. This last circumstance is expedient for checking the beneficial effect on modal noise derived from exciting the fiber with N laser sources. (8 refs.)

100915 The use of the Monte-Carlo method for computation of impulse response of a regular multimodal fiber. Ye.L.Yefremov, V.P.Mal'tsev, T.V.Selezneva, V.N.Tutubalin.
Radio Eng. & Electron. Phys. (USA), vol.27, no.10, p.16-20 (Oct. 1982). Translation of: *Radiotekh. & Elektron. (USSR)*, vol.27, no.10, p.1875-80 (Oct. 1982).
An approximate method of computation of impulse response of a multimodal, regular glass fiber is presented. A comparison of this method with the exact method indicates that the approximate method is suitable for operational estimation of the impulse response. (7 refs.)

100916 Optical heterodyne fiber gyro. K.Hotate, N.Ookuma, M.Higashiguchi, N.Niwa (Faculty of Engng., Univ. of Tokyo, Tokyo, Japan).
Trans. Soc. Instrum. & Control Eng. (Japan), vol.19, no.4, p.319-26 (April 1983). In Japanese.
A phase-nulling detection is useful for obtaining a good linearity and scalefactor stabilisation in a fibre gyro. The authors utilise an optical heterodyne technique followed by an electronic phase-nulling detection, which provides electric signal frequency proportional to the rotation rate. To reduce the output drift, the optical system of the gyro has little pathlength difference

and no frequency difference in the fibre loop between counterpropagating waves. Reduction of the output noise that is due to the backward Rayleigh scattering in the fibre is achieved by direct frequency modulation of a single-mode laser diode, the optical source. The constructed experimental gyro shows a short-time resolution of about 5 deg/h rotation rate for an integration time of 1 sec, and a good linearity even in fast rotation. (24 refs.)

100917 **A sharp bend in an optical fiber waveguide as a basis for sensors of physical quantities.** M.E.Zhabotinskiy, A.A.Zatykin, S.K.Morshnev, A.S.Ryabov, A.V.Frantsesson.
Telecommun. & Radio Eng. Part 2 (USA), vol.37, no.8, p.62-6 (Aug. 1982). Translation of: *Radiotekhnika, Moskva (USSR)*, vol.37, no.8, p.8-13 (Aug. 1982).
It is proposed to use a sharp bend as an operating element of a refractometer which can be used to construct sensors for measuring the level of a liquid, temperature, pressure, and concentrations of solutions. (6 refs.)

100918 **Beat length determination of birefringent fibers by measuring delay of transmitted light pulse.** Y.Fujii (Fundamental Sci. & Opto-Electronics Div., Electrotech. Lab., Ibaraki, Japan), S.Shikano.
Trans. Inst. Electron. & Commun. Eng. Jpn. Part C (Japan), vol.J66C, no.5, p.424-5 (May 1983). In Japanese.
Proposes a method for determining the beat length of stress-induced birefringent fibers by measuring the delay time between transmitted polarizing pulses. This method is easily applied to long birefringent single mode fibers at infrared wavelengths by using a single-pass fiber Raman laser. (3 refs.)

100919 **Influence of spectral composition of bias lighting emission on resolution of image-convertor tube in visual display systems.** S.M.Gvozdev, S.S.Romanov.
Izv. VUZ Priborostr. (USSR), vol.26, no.6, p.77-80 (June 1983). In Russian.
An examination is made of the problem of the effectiveness of using monochromatic bias-lighting sources in the pulsed operation of image-convertor tubes. An apparatus for investigating the resolution of image-convertor tubes is described and the results of investigations for different spectral compositions of the emission in the static and pulsed modes of operation are presented. 100920 **Local-oscillator excess-noise suppression for homodyne and heterodyne detection.** G.L.Abbas, V.W.S.Chan, T.K.Yee (MIT Lincoln Lab., Lexington, MA, USA).
Opt. Lett. (USA), vol.8, no.8, p.419-21 (Aug. 1983).
Semiclassical calculations of the signal-to-noise density ratio for a homodyne/heterodyne receiver utilizing two detectors are made. These calculations show that excess intensity noise in the local oscillator can be cancelled and need not degrade the performance of the receiver. An experimental demonstration of excess-noise cancellation is reported. (7 refs.)

100921 **Fiber-optic detectors.** E.Beata Radojewska (Inst. of Phys., Tech. Univ. of Wroclaw, Wroclaw, Poland), J.M.Pawlikowski.
Opt. Appl. (Poland), vol.13, no.1, p.3-31 (1983).
A short review of the current state of the art of fiber-optic detectors is presented including design parameters for 1.3 μm-wavelength systems. Experimental data of such detectors comprising technology data, operation modes and basic detector parameters are concisely discussed. Properties of the semiconductors used in optical fiber transmission systems are also reviewed. Special attention is given to the properties and technology of ternary Ga(As,Sb) alloys. Finally, the proposal of a high-efficiency fiber-optic detector made of graded-bandgap Ga(As,Sb) mixed crystal is discussed. (122 refs.)

100922 **Wavelength-division multiplexing of channels in fiber-optic communication lines (review).** E.M.Dianov, A.A.Kuznetsov (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.2, p.125-38 (Feb. 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.2, p.245-64 (Feb. 1983).
A review is given of the prospects for the application of wavelength-division multiplexing of channels in fiber-optic communications, i.e. for the simultaneous transmission of several data signals at different optical carrier frequencies. The various systems of multiplexers and demultiplexers developed by the application of spectroscopic methods to optical communications are described together with systems based on new physical principles. The existing communication systems with wavelength-division multiplexing of channels are described. It is concluded that such multiplexing can be used to handle tens of channels in the same fiber waveguide tens of kilometers long. (48 refs.)

42.82 INTEGRATED OPTICS
(for optical waveguides see also 42.80L)

100923 **Photodetector for guided-wave optics.** H.Yajima.
Oyo Buturi (Japan), vol.52, no.3, p.235-6 (March 1983). In Japanese.
There are two types of optical integrated-circuits: one converts an input optical signal into an electrical signal and then reconverts it into the optical signal with a thin-film waveguide and then delivers the resultant electrical signal. For the latter, an $LiNbO_3$ electrooptical crystal substrate is suitable for forming a waveguide. The author describes a method for integrating amorphous-silicon photodetector elements on the $LiNbO_3$ waveguide. For photodetectors to exhibit maximum sensitivity to semiconductor laser light, it is indispensable to develop a Ge-contained amorphous-silicon detector element. (4 refs.) *K.B.*

100924 **Parametric mixing in monolayers deposited on thin-film waveguides.** J.E.Sipe (Dept of Phys., Univ. of Toronto, Toronto, Ontario, Canada), G.I.Stegeman, C.Karaguleff, R.Fortenberry, R.Moshrefzadeh, W.M.Hetherington,III, N.E.Van Wyck.
Opt. Lett. (USA), vol.8, no.8, p.461-3 (Aug. 1983).
The authors analyze the parametric mixing of light by molecular monolayers deposited on a thin-film dielectric waveguide. It is shown that large signal levels are possible, even with CW lasers. (10 refs.)

100925 **Morphological stability in epitaxy of monolithically integrated optical devices.** M.A.Herman (Inst. of Phys., Polish Acad. of Sci., Warszawa, Poland).
Opt. Appl. (Poland), vol.13, no.1, p.55-67 (1983).
Three technological/methods: LPE, MO CVD, and MBE have been compared from the point of view of their crystallization peculiarities related to the fabrication of optical monolithically integrated devices. Ignoring the dependence of the crystal growth rate on the substrate orientation, the morphological stability functions of Mullins and Sekerka (1964) for each epitaxy process have been calculated for the GaAs-$Al_xGa_{1-x}As$ material system. It has been shown that MBE is the most suitable crystallization method for monolithic optical integration, MO CVD being a less suitable method. (26 refs.)

100926 **Integrated optics—devices.** J.S.Wilkinson (Dept. of Electronic & Electrical Engng., Univ. Coll., London, England).
Phys. Technol. (GB), vol.14, no.4, p.190-3, 8 (July 1983).
The main advantages of integrated optics devices lie in the inherent simplicity of all-optical systems and high switching speeds (>5 Gbit s^{-1}). The outstanding device problems include the connection of optical fibres to these microcircuits and the integration of many devices on a single chip. The development of integrated optics is limited by the materials technology available but some promising work is being done in this area. (4 refs.)

100927 **Fabrication techniques for integrated optics devices.** R.A.Betts (Dept. of Electrical & Electronic Engng., Univ. Coll. London, London, England).
Phys. Technol. (GB), vol.14, no.4, p.194-8 (July 1983).
Developments in integrated optics are limited by the materials technology available. Progress in optical fibre technology and the development of sophisticated optical chips to generate, modulate and process laser light signals along the fibres are discussed. (5 refs.)

100928 **An investigation of multimodal interference of surface light waves in a microwaveguide interferometer.** A.P.Ostroumenko, V.P.Prudkiy, A.V.Shmal'ko.
Radio Eng. & Electron. Phys. (USA), vol.27, no.10, p.11-15 (Oct. 1982). Translation of: *Radiotekh. & Elektron. (USSR)*, vol.27, no.10, p.1869-74 (Oct. 1982).
Results of investigation of multimodal interference between surface light waves in a Mach-Zander microwaveguide interferometer. The interferometer is constructed from planar optical waveguides, loaded by a dielectric strip, i.e. the so-called strip optical waveguides. It is shown that the use of strip waveguide in interferometers of this type results in their effective low-modal and multimodal operation. (13 refs.)

100929 **Integrated optics and its application limits.** J.Schrofel.
Slaboproudy Obz. (Czechoslovakia), vol.44, no.7, p.313-21 (July 1983). In Czech.
Discusses the present state of the art in the field of integrated optics and the possibilities of its application in optical systems for transmitting and processing information. Examples are given of various types of planar component parts for distributing and controlling conducted radiation; there is also an analysis of the physical, material, design and manufacturing factors limiting the characteristics of the optical waveguides and component parts used. (14 refs.)

100930 **Signal transmission in a system of two injection lasers optically coupled with a fiber lightguide.** Vu Van Luk, P.G.Eliseev, M.A.Man'ko, G.T.Mikaelyan.
Sov. Phys.-Lebedev Inst. Rep. (USA), no.10, p.27-30 (1982). Translation of: *Sb. Kratk. Soobshch. Fiz. AN SSSR Fiz. Inst. P.N. Lebedeva*, no.10, p.31-4 (1982).
The authors study the possibility of using the saturation effect in injection lasers in the system of two-sided fiber-lightguide coupling, with stripe-geometry heterolasers based on AlGaAs as the terminal devices. (1 ref.)

100931 **Mode filter characteristics of metal-clad GaAs waveguide and its application to light intensity modulator.** S.Ohke, A.Kusunoki, Y.Cho, Y.Matsuo (Inst. of Sci. & Industrial Res., Osaka Univ., Ibaraki, Japan).
Trans. Inst. Electron. & Commun. Eng. Jpn. Part C (Japan), vol.J66C, no.5, p.426-7 (May 1983). In Japanese.
Mode filter characteristics have been studied at 1.15 μm in metal-clad GaAs waveguides with Au, Pt-Pd and Ag. As an application of the mode filter, electro-optic light intensity modulation was investigated in a unified Schottky junction structure of modulator- and analyzer-sections using metal-cladding with (110) crystal axis. 42.85 OPTICAL TESTING AND WORKSHOP TECHNIQUES

100932 Method of characterizing the optical quality of glass. E.M.Vogel (Bell Labs., Murray Hill, NJ, USA).
Appl. Opt. (USA), vol.22, no.15, p.2241-2 (1 Aug. 1983).
Describes a system based on an instrument to measure 90° laser light scattering coupled to a data management section, for characterising the optical quality of glass. (3 refs.)

100933 Modeling the computer-controlled polishing process. R.A.Jones (Perkin-Elmer Corp., Norwalk, CT, USA).
Appl. Opt. (USA), vol.22, no.15, p.2245-6 (1 Aug. 1983).
To optimize the computer-controlled polishing (CCP) operation, its removal process was modeled on a computer. The algorithm large optics fabrication simulation (LOFS) was created to simulate the removal of surface errors by both figuring and smoothing mechanisms. The CCP moves a grinding or polishing tool, considerably smaller than the workpiece, over the workpiece with the path and velocity of the tool (along that path) controlled by a minicomputer. The CCP figuring operation is accomplished by altering the time that the tool polishes any surface region, and smoothing results from greater pad pressure at high surface points due to greater pad compression as the pad attempts to conform to the workpiece surface. Since the high surface points are polished with greater pressure, more material removal is obtained for those areas. The LOFS algorithm was modified to reliably forecast figure results for the CCP. This program uses actual surface data and CCP parameters and provides a simulation of CCP polishing including figuring, smoothing, and edge correction. (2 refs.)

100934 The design of the kinematics of the knife movement in the production of a circular paraboloid. S.Michal, J.Wagner.
Jemna Mech. & Opt. (Czechoslovakia), vol.28, no.7, p.180-2 (July 1983). In Czech.
Deals with the problem of fabricating rotational aspherical surfaces of the second order. After a brief analysis of the available production processes, a more detailed analysis of a method based on the utilisation of plane sections obtained by a knife instrument is presented. The main attention is paid to the kinematic constructional modification of the conventional production equipment by implementing three new elements into the kinematic chain. The modification improves the production effectiveness as well as the quality of the aspherical surfaces. (3 refs.) *E.D.*

100935 High resolution etching of GaAs and CdS crystals. D.V.Podlesnik, H.H.Gilgen, R.M.Osgood (Dept. of Electrical Engng., Columbia Univ., New York, NY, USA), A.Sanchez, V.Daneu.
Laser Diagnostics and Photochemical Processing for Semiconductor Devices. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.57-63
Submicrometer gratings have been etched in GaAs and CdS crystals which have been immersed in an oxidizing etch and illuminated with interfering laser beams. A resolution of 170 nm was obtained. At high laser intensity and with prolonged etching time the surface properties of the material are degraded. The use of in-situ optical measurements of grating parameters allows ready optimization of the grating fabrication process. (9 refs.)

100936 Far field patterns for the impedance boundary value problem in acoustic scattering. D.Colton (Dept. of Math. Sci., Univ. of Delaware, Newark, DE, USA).
Appl. Anal. (GB), vol.16, no.2, p.131-9 (1983).
New and more straightforward proofs are given showing that the class of far field patterns corresponding to the scattering of entire incident fields by a bounded obstacle in the plane having nonzero surface impedance is dense in $L^2[0,2\pi]$ for all values of the wave number. (11 refs.)

100937 Spherical wave decomposition approach to ultrasonic field calculations. C.P.Griffice (Dept. of Radiology-Phys., Sidney-Farber Cancer Inst., Boston, MA, USA), J.A.Seydel.
J. Nondestr. Eval. (USA), vol.2, no.3-4, p.241-7 (Dec. 1981).
A simple, flexible, accurate, and comprehensive numerical method is presented for theoretically analyzing the diffraction field of a continuous wave transducer of arbitrary size, shape, and frequency. Using the extensively studied circular transducer for comparison, numerical results are shown for an unfocused transducer with uniform velocity excitation as well as for a focused transducer with Gaussian velocity excitation. Data concerning the execution time, program size, and convergence of the method are also presented for its implementation as a design tool on a minicomputer system. (33 refs.)

100938 Active cancellation of the acoustic field in the case of sound sources with small frequency shifts. A.Gaudefroy (CNRS, Marseille, France).
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.15, p.1139-42 (25 April 1983). In French.
Starting from equations previously obtained, it is shown that it is possible, up to a certain extent, to increase the number of secondary sources in such a way that small frequency shifts will not affect the control already set, which corresponds to a zero field. (6 refs.)

100939 Energy balance in active sound attenuation. G.Dumery (Univ. de Toulon et du Var, La Garde, France).
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.16, p.1225-7 (2 May 1983). In French.
The energy balance in active sound attenuation of a plane wave by an array of antagonistic sources was estimated. It is shown that an active sound attenuator is not necessarily a sound absorbing device. (2 refs.)

100940 Planning of electroacoustical units. II. W.Salm.
Elektrotechnik (Switzerland), vol.34, no.6, p.69-73 (June 1983). In German.
For pt.I see ibid., no.5, p.61 (1983). Conditions governing sound propagation in rooms when a group of loudspeakers is used are considered, and indications for spacing between the speakers are quoted. This is followed by the outline of amplifiers location for optimizing the effect and for reducing the echo or other interferences affecting the intelligibility of the received sound signals. (9 refs.) *I.G.*

100941 On the Green's function for acoustical diffraction by a strip. A.K.Gautesen (Dept. of Math., Iowa State Univ., Ames, IA, USA).
J. Acoust. Soc. Am. (USA), vol.74, no.2, p.600-4 (Aug. 1983).
The author assumes that the solution to the problem of diffraction by a strip with an impedance boundary condition of a plane-wave incident under a fixed angle ϕ is known. He shows how to construct the Green's function and the solution for a plane-wave incident under any angle from this known solution; and he also gives a simple equation which relates the farfield coefficient for plane-wave incidence under any angle to the known farfield coefficient corresponding to the angle of incidence ϕ. (3 refs.)

100942 Observation of the acoustic glory: high-frequency backscattering from an elastic sphere. P.L.Marston, K.L.Williams, J.B.Hanson (Dept. of Phys., Washington State Univ., Pullman, WA, USA).
J. Acoust. Soc. Am. (USA), vol.74, no.2, p.605-18 (Aug. 1983).
Measurements of the scattering of 2.10-MHz ultrasonic bursts gave direct evidence of the acoustic glory. Echo amplitudes were measured as a function of the transverse displacement x from the backward axis; they were maximized on the axis and they manifested side lobes. Except near minima, the amplitudes were proportional to $J_0(kbx/z_n)$, where b and z_n are the radius of, and axial distance to, the virtual focal circles from which the echoes appeared to emanate. This dependence on x is direct evidence of axial focusing. (The principal feature of optical glories of drops and bubbles is also axial focusing.) The experiment was performed in water with a fused silica sphere having a radius $a \simeq 51.6$ mm for which $2\pi a/\lambda = ka \simeq 457$. A theory is developed for certain of the echo amplitudes and focal parameters. The theory typically overestimates the amplitudes of the stronger of the echoes by 5%. Appendices describe aspects of the theory not amenable to the experiment, including: (i) a shift of focal parameters which should be significant when $ka \gtrsim 100$, and (ii) a distortion of transients described in part by the half-order derivative operator. (40 refs.)

100943 An extended unitary approach for acoustical scattering from elastic shells immersed in a fluid. M.F.Werby, L.H.Green (Naval Coastal Systems Center, Panama City, FL, USA).
J. Acoust. Soc. Am. (USA), vol.74, no.2, p.625-30 (Aug. 1983).
Derives equations using the T-matrix approach for acoustical scattering from elastic shells immersed in a fluid. The equations contain unitary and symmetry constraints and afford a new procedure for the calculation of the T-matrix. The technique, in addition to satisfying symmetry and unitary conditions, proves to be more numerically stable and less time consuming than the conventional method. In addition, the procedure enables one to determine if convergence has been satisfied and in the limit of no convergence, proves to be a better approximation than that of the matrix method. The authors have developed computer codes using the new technique and present comparisons with the conventional procedure. A salient feature of the new technique is that convergence is arrived at with a smaller number of expansion terms than the older method and this is particularly true as the aspect ratio of the target is increased. (16 refs.)

100944 Wave propagation through a slender curved tube. L.Ting, M.J.Miksis (Courant Inst. of Math. Sci., New York Univ., New York, NY, USA).
J. Acoust. Soc. Am. (USA), vol.74, no.2, p.631-9 (Aug. 1983).
The transmission of an acoustic wave through a slender three-dimensional tubular region is investigated. The ratio of the reference length a of a cross section of the tube to the reference curvature of the center line of the tube is assumed to be small. The analysis is carried out for wavelengths ranging from the order of the reference curvature of the center line of the tube to wavelengths much smaller than the reference length of the cross-sectional area. It is shown that the leading solution inside the tube is governed by the same equation as for an equivalent straight tube except for the case where the wavelength is much smaller than the reference length a. For the latter the leading solution is governed by a partial differential equation in the cross section of the tube. The radius of curvature of the center line enters only into the amplitude of the leading order solution of the short waves. (9 refs.)

100945 A note on acoustic wave propagation in periodically stratified media. A.Maewal (Dept. of Mech. Engng., Yale Univ., New Haven, CT, USA).
J. Acoust. Soc. Am. (USA), vol.74, no.2, p.654-5 (Aug. 1983).
This letter has been motivated by a recent paper [Schoenberg and Sen., ibid., vol.73, p.61 (1983)] on perusal of which it occurred to the author that it should be possible to derive the macroscopic acoustic properties of a medium with periodic microstructure by utilizing the same analytical methods that have been useful for the problem of heat conduction in such media. (4 refs.)

100946 Scattering of short ultrasonic pulses by thin cylindrical shells, generation of guided waves inside the shell. M.Fekih, G.Quentin (Groupe de Phys. des Solides, Univ. Paris 7, Paris, France).
Phys. Lett. A (Netherlands), vol.96A, no.7, p.379-84 (18 July 1983).
The authors have studied the backscattering of short ultrasonic pulses by solid elastic cylindrical shells at high values of ka. When the thickness e of the shell is larger than the mean value of the wavelength λ_L for longitudinally polarized waves, the scattered echoes are well explained by a geometrical theory and their interpretation is trivial. Much more interesting is the case of very thin shells ($e < \lambda_L$) where the authors have observed the generation of two kinds of guided waves reradiating in the outer liquid and also in the inner

liquid when present. For these shells five different sets of echo corresponding to distinct propagation procedures have been identified. (5 refs.)

100947 Caustic formed with the participation of a diffracted ray. O.A.Godin (Physicotech. Inst., Moscow, USSR).
Sov. Phys.-Acoust. (USA), vol.29, no.1, p.13-18 (Jan.-Feb. 1983). Translation of: *Akust. Zh. (USSR)*, vol.29, no.1, p.23-31 (Jan.-Feb. 1983).
An asymptotic expression is derived for the field in the neighborhood of a caustic formed with the participation of a diffracted ray. A procedure is given for determining the field near the caustic in terms of the ray characteristics. An an example, the reflection of a spherical acoustic wave from a layered fluid half-space is analyzed. (13 refs.)

100948 Method for determining the directivity pattern of low-frequency radiators. V.A.Baranov, Yu.V.Khokha (N.N. Andrew Acoustics Inst., Acad. of Sci., USSR).
Sov. Phys.-Acoust. (USA), vol.29, no.1, p.68-9 (Jan.-Feb. 1983). Translation of: *Akust. Zh. (USSR)*, vol.29, no.1, p.117-18 (Jan.-Feb. 1983).
Under conditions such that the influence of one of the boundaries is made negligibly small, it is possible to formulate a comparatively simple method for determining the required characteristics of the source. In the practical implementation of the given method the accuracy of determination of the resultant directivity patterns of an investigated low-frequency radiator can be affected by methodological errors associated with the presence of zeros in the directivity pattern of the system 'source+virtual image'. To avoid large-scale errors and improve the accuracy of the measurements it is recommended to perform the measurements at more than three points. The authors take advantage of the fact that the positions of the zeros of the directivity pattern should be independent of h, but this is not the case for the system 'source+-virtual image'. (2 refs.)

100949 Acoustic wave diffraction in reflective groove structures. A.Opilski, M.Urbanczyk, W.Wajda (Inst. of Phys., Silesian Tech. Univ., Gliwice, Poland).
Ultrasonics (GB), vol.21, no.5, p.215-16 (Sept. 1983).
A reflective groove structure is a component part of an acoustic surface wave resonator. The diffraction effects in this structure are the subject of this paper. Reflective groove structures are characterized by a concentration of acoustic wave energy, and losses due to diffraction are small. (4 refs.)

43.30 UNDERWATER SOUND

(see also 92.10 Physics of the ocean)

100953 Effect of pressure on sound absorption in synthetic seawater and in aqueous solutions of $MgSO_4$. C.C.Hsu, F.H.Fisher (Univ. of California, San Diego, CA, USA).
J. Acoust. Soc. Am. (USA), vol.74, no.2, p.564-9 (Aug. 1983).
Measurements have been made, at 25°C, of the effect of pressure on sound absorption in Lyman and Fleming (LF) synthetic seawater from 30-300 kHz up to 307 atm. Similar measurements were made in 0.02M $MgSO_4$ solution in a 0.02M $MgSO_4$-0.6M NaCl solution. The decrease with pressure of absorption per wavelength $(\alpha\lambda)$ in LF seawater differs substantially from those reported by other investigators. The relaxation frequency, within experimental error, was found to be independent of pressure. For LF seawater, increasing pressure to 307 atm reduced absorption by 26.3%, very nearly the same as was observed previously (28.2%) for 0.5M $MgSO_4$ solutions. The addition of 0.6M NaCl to the 0.02M $MgSO_4$ solution decreased the absorption by a factor of 4 and the effect of pressure was found to be independent of the NaCl concentrations. The Eigen and Tamm multistate dissociation parameters which best describe the pressure dependence of sound absorption and electrical conductance in a 0.02M $MgSO_4$ solution predict a 21.4% decrease in absorption at 307 atm compared with the observed 19.6% decrease. However, these parameters yield an equilibrium constant which differs from the conductance derived value by a factor of 3. (25 refs.)

100954 Green's function continuation for acoustic propagation in range-dependent environments. H.Weinberg (New London Lab., Naval Underwater Systems Center, New London, CT, USA).
J. Acoust. Soc. Am. (USA), vol.74, no.2, p.570-5 (Aug. 1983).
The acoustic field in a range-dependent ocean environment is expressed as a surface integral of Green's functions. Then, if one can find Green's functions for small domains, the solution can be continued to large domains. Several simplifying approximations are introduced. If one expresses the known pressure and Green's functions in raylike expansions, and apply stationary phase, the transverse integration can be eliminated. It is suggested that certain forward derivatives are negligible at typical ranges and frequencies of interest. The principal result of this article considers propagation in a vertical plane through the source. Finally, it is shown that the Green's function continuation agrees with ray theory in the high-frequency limit. In general, the approach developed here should be accurate and readily evaluated for many problems of practical interest. (11 refs.)

100955 On the plane-wave reflection coefficient and nonspecular reflection of bounded beams for layered half-spaces underwater. D.B.Bogy, S.M.Gracewski (Dept. of Mech. Engng., Univ. of California, Berkeley, CA, USA).
J. Acoust. Soc. Am. (USA), vol.74, no.2, p.591-9 (Aug. 1983).
Studies the recently derived reflection coefficient for plane waves in a liquid that are incident on the liquid-solid interface of a solid half-space, which consists of a single layer of one elastic material bonded to a substrate of a different material. Plots of the magnitude of the reflection coefficient versus the incident angle are presented for many sets of material parameters and values of frequency *f* and layer thickness *d*. The use of the results presented for the study of nonspecular reflection of bounded acoustic beams is of primary interest. The authors therefore seek to identify all the critical incidence angles for nonspecular reflection. They find that nonspecular reflection can occur, not only in connection with surface waves that are purely propagating modes in the absence of the liquid, but also for leaky modes on a layered half-space, provided the leakage is not too great. The authors also investigate, in particular, the surface wave propagation for the case of a stiff layer on a soft half-space, and they find that the purely propagating mode cuts off with increasing *fd* when its speed reaches the shear wave speed of the substrate, as reported in the literature. However, as *fd* increases further, a leaky mode appears that approaches the Rayleigh wave for the layer. This leaky mode is also associated with nonspecular reflection for large enough *fd*. (26 refs.)

100956 Acoustic wave scattering by elastic cylindrical shells in water. T.A.K.Pillai, V.K.Varadan, V.V.Varadan (Wave Propagation Group, Ohio State Univ., Columbus, OH, USA), R.P.Radlinski.
J. Acoust. Soc. Am. (USA), vol.74, no.2, p.619-24 (Aug. 1983).
Frequency dependence of acoustic wave scattering by an infinite cylindrical shell of arbitrary cross section is analyzed using the *T*-matrix approach. Explicit expression for the *T*-matrix of a two-layered cylinder is presented. Numerical results are obtained for plane wave incidence normal to the axis of the shell but arbitrary with respect to the nonciruclar cross section for a range of frequencies. Backscattering cross sections for various angles of incidence are presented for aluminum, steel, and plastic compliant tubes. The results obtained for circular elliptical cross sections are compared with other available theoretical and experimental results. (15 refs.)

100957 Application of time-delay-and-integrate c.c.d.s in sector scanning sonars. M.H.Yassaie, L.H.Ong, P.N.Denbigh (Dept. of Electronic & Electrical Engng., Univ. of Birmingham, Birmingham, England).
Radio & Electron. Eng. (GB), vol.53, no.7-8, p.295-300 (July-Aug. 1983).
Non-uniform time-delay-and-integrate (n.u.t.d.i.) devices have been designed and used for fast beam scanning. The possibility of using such devices for very high angular resolution is examined and it is shown that there must be a trade-off between the number of angular resolution cells and the scanning rate. It is shown however that an improved sector scanning sonar may be realized by combining modulation scanning with the time delay scanning. It is also shown how the n.u.t.d.i. device can be used to advantage for solving the ambitious problem of two dimensional beam scanning. (8 refs.)

100958 Stereoscopic visualization and contour mapping of the sea bed using a bathymetric sidescan sonar (BASS). P.N.Denbigh (Dept. of Electronic & Electrical Engng., Univ. of Birmingham, Birmingham, England).
Radio & Electron. Eng. (GB), vol.53, no.7-8, p.301-7 (July-Aug. 1983).
Besides the backscattered amplitude measurements of a conventional sidescan sonar, the Bathymetric Sidescan Sonar (BASS) makes simultaneous measurements of the depth of the sea bed throughout the sidescanned area. It does this by determining the angle of the returning wavefront at each instant in time and combining the result in an appropriate manner with the range measurement. The depth information can be used to generate contour maps. It can also be used to generate stereoscopic images of the sea bed. A potential cause of major errors in the depth measurement is surface multipath interference, and special features are introduced into the transducer design to avoid this. (8 refs.)

100959 Operation of a horizontal line array in a shallow sea. V.A.Eliseevnin (N.N. Andreev Acoustics Inst., Acad. of Sci., USSR).
Sov. Phys.-Acoust. (USA), vol.29, no.1, p.25-8 (Jan.-Feb. 1983). Translation of: *Akust. Zh. (USSR)*, vol.29, no.1, p.44-9 (Jan.-Feb. 1983).
The directional properties of an extended horizontal line array in a shallow sea are investigated. The latter is represented by a homogeneous water layer,

which has a perfectly compliant surface and is bounded below by a fluid half-space. The response of the array is calculated in the sound field of a tone signal, which is represented by a sum of normal modes. (4 refs.)

100960 Theory of sound propagation in a layered variable-density ocean. V.I.Klyatskin, L.Ya.Lyubavin (Pacific Ocean Oceanological Inst., Acad. of Sci., USSR).
Sov. Phys.-Acoust. (USA), vol.29, no.1, p.36-9 (Jan.-Feb. 1983). Translation of: *Akust. Zh. (USSR)*, vol.29, no.1, p.64-8 (Jan.-Feb. 1983).
The field of a point source in a layered inhomogeneous medium with a variable density is investigated. The method of invariant imbedding is used to reduce the solution of the boundary-value problem for various conditions at the boundary of the medium to the solution of a Riccati equation and the subsequent computation of a series of quadratures. Derivatives of the density are not involved in this approach. (6 refs.)

100961 Excitation of groups of modes in a layered ocean. V.N.Kulakov, N.E.Mal'tsev, S.D.Chuprov (N.N. Andreev Acoustics Inst., Acad. of Sci., USSR).
Sov. Phys.-Acoust. (USA), vol.29, no.1, p.41-4 (Jan.-Feb. 1983). Translation of: *Akust. Zh. (USSR)*, vol.29, no.1, p.74-9 (Jan.-Feb. 1983).
The structure of the field of a point source in a layered ocean is investigated. Expressions are derived in the WKB approximation for the field created by groups of normal modes excited in phase. (3 refs.)

43.40 MECHANICAL VIBRATIONS AND SHOCK

(see also 46.30M Vibrations, aeroelasticity, hydroelasticity, mechanical waves and shocks)

100962 Sound radiation from an impact-excited clamped circular plate in an infinite baffle. A.Akay, M.Latcha (Mech. Engng. Dept., Wayne State Univ., Detroit, MI, USA).
J. Acoust. Soc. Am. (USA), vol.74, no.2, p.640-8 (Aug. 1983).
Sound radiation from most mechanical systems results from impact forces of various kinds. In this paper, transient sound radiation from impact-excited circular plates is studied both analytically and experimentally. First, the contact force developed during the inelastic collision of a ball with a flexible plate was obtained. The plate vibrations were then obtained using normal mode analysis. The sound radiation waveforms in the time domain were obtained by numerical integration of the Rayleigh integral. Both analytical and experimental results show the radiation of a sound pulse during the contact which is a result of the forced deformation of the plate. Quantitative relationships are given for the plate vibration response and acoustic radiation. (25 refs.)

100963 Pressure radiated by an infinite plate driven by distributed loads. M.C.Junger (Cambridge Acoustical Associates Inc., Cambridge, MA, USA).
J. Acoust. Soc. Am. (USA), vol.74, no.2, p.649-53 (Aug. 1983).
The pressure radiated by an effectively infinite elastic plate is formulated for rectangular and axisymmetric load distributions and for straight and circular line forces. The farfield pressure on the normal to the plate is shown to depend only on the resultant load applied, irrespective of its distribution. For extensive loads, the directivity pattern may display nulls which reduce the mainbeam width below that of the point-excited plate. The location of these nulls is not altered by plate orthotropicity as they are exclusively a function of the load distribution. The load distribution may be adjusted to have a null cancel the coincidence peak at a selected frequency. Power radiated by a point force is greater than for distributed loads or line forces. Finally, the plate acceleration in response to an incident spherical wave is related by the reciprocity principle to the plate's volume acceleration in response to an arbitrary distributed load. (13 refs.)

100964 Response of multiple layered media. G.Maidanik, L.J.Maga, T.J.Eisler (David Taylor Naval Ship Res. & Dev. Center, Bethesda, MD, USA).
J. Sound & Vib. (GB), vol.89, no.1, p.31-57 (8 July 1983).
A recently developed method for estimating the response of multiple coupled one-dimensional dynamic systems can be adapted to deal with the response of multiple layered media. This paper discusses this adaptation. The purpose is to bring this method to bear on this important subject, on the one hand, and to expand the range of applicability of the method on the other. In the method the interactions between the one-dimensional dynamic systems are defined in terms of reflection and transmission coefficients at junctions at which the dynamic systems terminate. In that sense the formalism is cast in terms of standard procedures in the investigations of the response of multiple layered media and, therefore, the adaptation is straightforward. Once the adaptation is instituted, the procedures are extended so that the formalism can treat situations in which steady flows are present in the layers. This extension has previously received only meager analytical attention. It is argued that in certain situations of this kind, the flows may introduce significant modifications in the response. The conditions and the nature of such modifications are defined and examined. (15 refs.)

100965 Influence of anisotropy and contact with a liquid on the vibrations of an infinite plate driven by a point force. V.A.Golovanov, A.L.Popov (Inst. of Problems in Mech., Acad. of Sci., USSR).
Sov. Phys.-Acoust. (USA), vol.29, no.1, p.18-21 (Jan.-Feb. 1983). Translation of: *Akust. Zh. (USSR)*, vol.29, no.1, p.32-7 (Jan.-Feb. 1983).
In the case of steady-state flexural vibrations of an infinite anisotropic plate in a fluid, explicit expressions are derived for the bending mode configuration of the plate and for the surface acoustic-pressure wave. (7 refs.)

100966 Pressure impulse generated by a sphere expanding at a constant rate. Yu.V.Petukhov (Radiophys. Sci.-Res. Inst., USSR).
Sov. Phys.-Acoust. (USA), vol.29, no.1, p.51-2 (Jan.-Feb. 1983). Translation of: *Akust. Zh. (USSR)*, vol.29, no.1, p.88-90 (Jan.-Feb. 1983).
The results of calculations of the pressure impulse in the linear approximation are compared with results obtained using the exact equations for a self-similar shock wave. The results in the Kirkwood-Bethe approximation yield substantially different values for the dependence of the pressure impulse on the rate of expansion of the boundaries of the sphere. (4 refs.)

100967 Impedance of a sphere as part of a system of two closely spaced oscillating spheres. G.V.Udalov.
Sov. Phys.-Acoust. (USA), vol.29, no.1, p.62-4 (Jan.-Feb. 1983). Translation of: *Akust. Zh. (USSR)*, vol.29, no.1, p.108-12 (Jan.-Feb. 1983).
The impedance of a sphere is determined as part of a system of two spheres separated by a small wave distance and oscillating in arbitrary directions. The solution is analyzed for special cases of spheres of identical radius oscillating in certain directions. (7 refs.)

On the disturbance produced by an impulsive shearing stress on the surface of a semi-infinite poro-elastic medium .... See Entry 101113

43.50 NOISE, ITS EFFECTS AND CONTROL

(see also 86.70J Environmental science)

100968 Interaction of a scalar wave with a noise field. R.Bourret (Inst. of Oceanography, Univ. of Oriente, Cumana, Venezuela).
Acustica (Germany), vol.53, no.3, p.162-5 (July 1983).
Shows that for the case of scalar waves with non-derivative scalar coupling, the background noise field perturbs the propagation exactly like a frozen random background. This in general is not very different from the purely spatial noise autocorrelation with a modified coherence length. In a given problem it should be considered whether some fraction of the intermediate propagators should be of the advanced type. The present analysis may be generalized both for more complicated couplings and, if desired, for waves, both coherent and incoherent (i.e. ϕ and ϵ) obeying other equations of propagation. (5 refs.)

100969 Suppression of noise by a plasma shield. A.P.Saxena, N.S.Suryanarayana (Dept. of Phys., Ravishankar Univ., Raipur, India).
Indian J. Pure & Appl. Phys., vol.21, no.6, p.359-60 (June 1983).
The transmission of sonics through an ionized medium has been numerically evaluated with the help of a computer. The analysis shows that if a source of noise is surrounded by a plasma barrier it can effectively shield most of the noise spectrum. (10 refs.)

100970 Theoretical foundations of urban noise control. R.Makarewicz (Inst. of Acoustics, A. Mickiewicz Univ., Poznan, Poland).
J. Acoust. Soc. Am. (USA), vol.74, no.2, p.543-58 (Aug. 1983).
Traffic noise propagating within an urban area of any configuration is considered. A street and a single building being a part of a 'loose urban area' are examined closely. Final results allow one to determine any composite index (based upon equivalent level-L_{eq}) of noise penetrating into a building, i.e., a room. These results are a synthesis of a study of such phenomena as: propagation of noise over a flat surface, specular reflection and scattering by the walls of buildings, and transmission through a barrier, e.g., a window. (46 refs.)

100971 Active noise control in finite length ducts. M.C.J.Trinder (Dept. of Electrical Engng. Sci., Univ. of Essex, Colchester, England), P.A.Nelson.
J. Sound & Vib. (GB), vol.89, no.1, p.95-105 (8 July 1983).
A simple technique for the active control of sound in ducts, initially suggested by Olson and May [1953], is investigated in detail. A simple, 'virtual earth' principle, feedback loop is used to drive the sound pressure to a minimum at a microphone placed close to a loudspeaker in the duct wall. This produces a reflection of downstream travelling plane waves. A detailed investigation of the loudspeaker near field has enabled the optimum position of the microphone to be identified. The system is shown to be especially effective at the frequencies of the longitudinal duct resonances, where the acoustic response of the dust produces a high loop gain. Results are presented which show a reduction of up to 20 dB in the amplitude of low frequency broadband noise at a position downstream of the cancelling source. (10 refs.)

100972 New low-frequency and infrasonic resonant sound absorber. K.A.Velizhanina, V.A.Oborotov (Phys. Faculty, M.V. Lomonosov State Univ., Moscow, USSR).
Sov. Phys.-Acoust. (USA), vol.29, no.1, p.3-6 (Jan.-Feb. 1983). Translation of: *Akust. Zh. (USSR)*, vol.29, no.1, p.5-10 (Jan.-Feb. 1983).
A new type of resonant sound absorber with a diffraction baffle, designed for the absorption of low audio and infrasonic frequencies, is proposed, analysed, and investigated experimentally. In such an absorber, as a result of diffraction effects, the total mass reactance is increased by an order of magnitude, and the resonance frequency is lowered. (5 refs.)

100973 Simple procedure for calculating noise loudness levels. Yu.A.Indlin (Sci.-Res. Inst. of Photography & Cinematography, USSR).
Sov. Phys.-Acoust. (USA), vol.29, no.1, p.28-30 (Jan.-Feb. 1983). Translation of: *Akust. Zh. (USSR)*, vol.29, no.1, p.50-4 (Jan.-Feb. 1983).
A procedure is proposed for calculating noise loudness levels according to two objectively measured parameters: the noise (intensity) level and the width of the noise spectrum, where the latter parameter is measured for complex noise according to the spectrogram recorded by third-octave filters, at the level of -24 dB relative to the noise level. Calculations by the proposed procedure have provided a more accurate approximation to subjective loudness assessments than the methods of Zwicker and Stevens. (6 refs.)

100974 Fan noise considerations. A.Potter (Torin Corp., Torrington, CT, USA).
Midcon/82 Conference Record, Dallas, TX, USA, 30 Nov.-2 Dec. 1982 (El Segundo, CA, USA: Electron. Conventions 1982), p.12/2/1-8
The reason for a fan's existence and for its use is the movement of air. Usually, in application to electronic equipment, the desired result is a flow of air through a compartment or around certain components to be cooled. This effect may be desired at a point some distance from the fan itself; clearly, the only effect required from the fan at its location is the establishment of a moving stream of air. Any other results are unnecessary, perhaps even detrimental. The author considers noise problems caused by fans. (no refs.)

43.55 ARCHITECTURAL ACOUSTICS

100975 Sound transmission through windows. II. Double and triple glazing. J.D.Quirt (Div. of Building Res., Nat. Res. Council of Canada, Ottawa, Ontario, Canada).
J. Acoust. Soc. Am. (USA), vol.74, no.2, p.534-42 (Aug. 1983).
For pt.I see ibid., vol.72, p.834 (1982). Experimental sound transmission loss data for double-glazed windows have been compared with the predictions of several theoretical models. Simple equations that provide a satisfactory empirical fit to the data were found. The transmission loss of double glazing was compared with that of triple glazing; the results are very similar when the combined interplane spacings of the triple window match the spacing of the double glazing. The triple glazing did, however, exhibit consistently higher transmission loss both at frequencies below the mass-air-mass resonances and in the vicinity of the coincidence dip. (17 refs.)

43.60 ACOUSTIC SIGNAL PROCESSING

100976 The S-matrix and acoustic signal structure in simple and compound waveguides. C.H.Wilcox (Dept. of Math., Univ. of Utah, Salt Lake City, UT, USA).
Appl. Anal. (GB), vol.15, no.1-4, p.255-81 (1983).
The author considers the propagation of transient acoustic fields in waveguides consisting of a semi-infinite cylinder coupled to a resonant cavity. The author calculates the signals and analyses how their structure depends on the sources and geometry of the waveguide. Particular attention is given to the cases when the signal sources and/or observation point lie in the cylinder far from the resonator. (12 refs.)

100977 An analogue Hilbert transformer for complex waveform detection. G.F.Manes, D.Gerli, P.Tortoli, C.Atzeni (Istituto di Elettronica, Univ. Degli Studi di Firenze, Firenze, Italy).
Ultrasonics (GB), vol.21, no.5, p.211-14 (Sept. 1983).
An analogue Hilbert transformer capable of performing complex envelope detection of ultrasonic waveforms is described and initial experimental results presented. The unit is based on a SAW programmable microprocessor controlled transversal filter, which accepts data a 3 MHz clock rate and is thus capable of processing the input waveform in real-time. A squaring-summing network performs the required operation for envelope extraction. (9 refs.)

43.63 ACOUSTIC HOLOGRAPHY

100978 Industrial applications of acoustical holography. B.P.Hildebrand, T.J.Davis, A.J.Boland, R.L.Silta (Spectron Dev. Labs. Inc., Seattle, WA, USA).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.353, p.121-30 (1983). (Industrial and Commercial Applications of Holography, San Diego, CA, USA, 24-25 Aug. 1982).
Acoustical holography is rapidly approaching commercial status with applications to nondestructive evaluation, underwater imaging, and underground pipe location being pursued. The authors review the techniques involved, show some experimental results, and describe the latest commercial system. (5 refs.)

100979 An arrangement of transmitter and receiver arrays for synthesizing acoustical holograms. K.Nagai, M.Kimura (Inst. of Appl. Phys., Univ. of Tsukuba, Ibaraki, Japan).
Trans. Inst. Electron. & Commun. Eng. Jpn. Part C (Japan), vol.J66C, no.5, p.409-15 (May 1983). In Japanese.
Discusses the reduction of the total number of transducers by compounding transmitter and receiver arrays in acoustic holography. The point spread function of such an imaging system is calculated and two kinds of grating lobes are shown. The arrangement of both arrays is specified so that it eliminates the grating lobes of a narrower period. Holograms are constructed for each transmitter and are combined into a single large hologram. A numerical image can be reconstructed by the conventional method from a synthesized hologram. (4 refs.)

43.70 SPEECH COMMUNICATION

(inc. speech perception, speech intelligibility, and speech synthesis; see also 87.36 Speech)

100980 Stress and vowel duration effects on syllable recognition. C.W.Marshall, P.W.Nye (Haskins Labs., New Haven, CT, USA).
J. Acoust. Soc. Am. (USA), vol.74, no.2, p.433-43 (Aug. 1983).
Systems designed to recognize continuous speech must be able to adapt to many types of acoustic variation, including variations in stress. A speaker-dependent recognition study was conducted on a group of stressed and destressed syllables. These syllables, some containing the short vowel /I/ and others the long vowel //, were excised from continuous speech and transformed into arrays of cepstral coefficients at two levels of precision. From these data, four types of template dictionaries varying in size and stress composition were formed by a time-warping procedure. Recognition performance data were gathered from listeners and from a computer recognition algorithm that also employed warping. It was found that for a significant portion of the data base, stressed and destressed versions of the same syllable are sufficiently different from one another as to justify the use of separate dictionary templates. Second, destressed syllables exhibit roughly the same acoustic variance as their stressed counterparts. Third, long vowels tend to be involved in proportionally fewer cross-vowel errors but tend to diminish the warping algorithm's ability to discriminate consonantal information. Finally, the pattern of consonant errors that listeners make as a function of vowel length shows significant differences from that produced by the computer. (21 refs.)

100981 The relationship between the RMS level and the average absolute magnitude of long-time continuous speech. R.J.Niederjohn, D.G.Haworth (Dept. of Electrical Engng. & Computer Sci., Marquette Univ., Milwaukee, WI, USA).
J. Acoust. Soc. Am. (USA), vol.74, no.2, p.444-6 (Aug. 1983).
The relationship between the average absolute magnitude and the RMS level of long-time continuous speech is reported in this paper. The ratio of these two measurements (called β) and the standard deviation of this ratio have been experimentally determined as a function of speech utterance lengths from 2.5 s to 10 min. For utterance lengths greater than about 20 s, the average value of β is approximately 0.55 and 0.60 for male and female speakers, respectively. (11 refs.)

100982 Acoustical effects of vertical vibrations of the vocal folds. E.V.Vlasov, V.N.Sorokin (Inst. of Information-Transmission Problems, Acad. of Sci., USSR).
Sov. Phys.-Acoust. (USA), vol.29, no.1, p.6-10 (Jan.-Feb. 1983). Translation of: *Akust. Zh. (USSR)*, vol.29, no.1, p.11-18 (Jan.-Feb. 1983).
Vertical vibrations of the vocal folds produce a highly perceptible effect, altering the timbre, generating turbulent noise, and improving the phonation of synthetic speech. The waveform of the excitation pulse is affected not only by the first, but also by the third time derivative of the volume velocity of the airstream through the glottis. (33 refs.)

100983 Speech processing—an outlook for the coming decade. N.R.Miller (Diebold Group Inc., New York, NY, USA).
Wescon/81 Conference Record, San Francisco, CA, USA, 15-17 Sept. 1981 (El Segundo, CA, USA: Electron. Conventions 1981), p.6/1/1-7
The author presents a forecast of the developments in speech processing technology over the coming decade. Consideration is given to speech synthesis and an applications forecast is presented in table form. Speech recognition is also discussed and a simplified block diagram of a speed recognition system given. Some application examples are cited. It is predicted that a significant development will be the combination of recognition and speed synthesis on the same semiconductor chip. However, the development of algorithms for accurate continuous speech recognition remains the most challenging task. (no refs.)

100984 Automatic speech recognition systems—evaluation and application. D.F.Fink (Intel Corp., Santa Clara, CA, USA).
Wescon/81 Conference Record, San Francisco, CA, USA, 15-17 Sept. 1981 (El Segundo, CA, USA: Electron. Conventions 1981), p.6/2/1-8
The author discusses automatic speech recognition (ASR) systems by firstly classifying them into four groups: speaker dependent systems; speaker independent systems; discrete word recognition; and connected word recognition. ASR performance factors are then considered and since most commercially available systems are discrete word speaker dependent systems, these are discussed in more detail. Finally, application selection criteria are covered with a brief mention of human factors. (no refs.)

43.75 MUSIC AND MUSICAL INSTRUMENTS

100985 Acoustic admittance of organ pipe jets. S.Thwaites, N.H.Fletcher (Dept. of Phys., Univ. of New England, Armidale, New South Wales, Australia).
J. Acoust. Soc. Am. (USA), vol.74, no.2, p.400-8 (Aug. 1983).
The admittance of a turbulent jet as the generator in organ flue pipes was investigated experimentally with respect to the relevant parameters, that is, the frequency, the jet efflux velocity, the mouth-end-correction, and the jet tip deflection at the edge. First, an experiment was performed using a jet with a pulsating velocity to drive a pipe to isolate and identify the various drive mechanisms occurring in the jet-pipe interaction. The two established drive mechanisms, momentum drive and volume drive, were found to be operating, but the relative proportion of momentum drive was greater than expected. Turning then to a typical flue pipe arrangement, as a preliminary experiment, the jet admittance in the pipe was shown to be independent of the jet tip deflection so long as the deflection was less than about 0.7 jet widths. This constant admittance regime was then used to facilitate measurement of the pipe excitation as a function of the three remaining parameters. The admittance magnitude and phase were used, in conjunction with a knowledge of the jet behavior, to quantify the relative importance of the two drive mechanisms here, revealing once again a greater proportion of momentum drive then expected. To a good approximation, the admittance magnitude multiplied by the efflux velocity, and the admittance phase were each found to lie on a universal curve when plotted against a parameter consisting of the frequency divided by the efflux velocity, provided the cutup was constant. A deviation from expected behavior, as yet to be explained, was found in the jet admittance and phase for very low frequencies and high blowing pressures. (17 refs.)

100986 The production of musical sounds by means of a microprocessor. I. A.Garcia.
Rev. Esp. Electron. (Spain), vol.30, no.343, p.52-4 (June 1983). In Spanish.
A method is described of converting the microprocessor system into a small electronic organ, by taking advantage of the facility with which a microprocessor is capable of generating square-wave signals in order to generate audible sounds. A flow diagram demonstrates the structure of a program capable of producing musical notes. (no refs.) *S.M.H.*

43.85 ACOUSTICAL MEASUREMENTS AND INSTRUMENTATION

(for acoustic noise measurement, see also 43.50; for photoacoustic spectroscopy, see 07.65)

100987 On the diffraction effects in an ultrasonic interferometer. A.S.Khimunin, E.A.Lvova (Inst. of High Frequency Currents, Leningrad, USSR).
Acustica (Germany), vol.53, no.3, p.107-22 (July 1983).
A numerical method is suggested for solving a model problem for an ultrasonic interferometer with a plane circular radiator of finite size and a plane movable reflector. The results are presented and analysed for computing fine structure of extrema in the reaction curve. A substantial difference is established in the diffraction shifts of maxima and minima of the reaction curve in relation to their position in the one-dimensional solution. Additional extrema on the reaction curve whose appearance is often ascribed to diffraction effects (the so-called 'diffraction satellites') have not been found. Numerical values are obtained for corrections to the measured values of ultrasound velocity and absorption coefficient. It is shown that diffraction corrections for the interferometric measurements can be substantially smaller than similar corrections applicable to the travelling wave conditions. The aspects are discussed of the realization in an experiment of the conditions adopted in a model problem which permit high accuracy of absolute measurements to be achieved. (47 refs.)

100988 Typical errors in using finite miniature ultrasonic probes for far field measurements. A.Markiewicz, R.C.Chivers (Dept. of Phys., Univ. of Surrey, Guildford, England).
Acoust. Lett. (GB), vol.6, no.10, p.142-7 (April 1983).
Limited calculations are presented of the effects of using hydrophones of diameters ranging from one to four wavelengths for measuring phase and amplitude distributions in the far field of a disc piston source. In agreement with intuitive ideas, it is shown that the errors may be kept below the usual instrumental uncertainties (1% in amplitude and a few degrees of phase) by using a hydrophone with a diameter of a wavelength or less. Computation of the errors due to misalignment indicate the need for a mechanical precision of positioning and repositioning of a quarter of a wavelength or better. (9 refs.)

100989 Interior imaging using spatial frequency sampling. E.El-Shirbini, D.A.Sinclair, I.R.Smith (Dept. of Electrical Engng., Univ. College, London, England).
J. Nondestr. Eval. (USA), vol.2, no.3-4, p.203-7 (Dec. 1981).
A new acoustic synthetic aperture geometry is demonstrated in which the image field is sampled in the spatial frequency domain. This means the sampled field is recorded in a particularly convenient form for presentation to the back propagation algorithms used to reconstruct the field at the object plane. The method has applications in interior visualization. It is difficult to image the interior of solid objects using lens based imaging systems because a different lens geometry must be used for each distinct object material. The system presented here overcomes such problems since both the angular variation of the transmission coefficient at the object-water interface and the aberrations introduced by the velocity mismatch at the object surface may be readily compensated for in the back propagation routine. Experimental results are presented illustrating the detection of four half wavelength diameter defects, spaced by three wavelengths, at a depth of eight wavelengths below the surface of an aluminum block. (6 refs.)

100990 Extension of an ultrasonic apparatus for measuring of sound velocity to the echo-overlap-method of Papadakis. J.Bernhardt (Tech. Univ. Dresden, Dresden, Germany).
Exp. Tech. Phys. (Germany), vol.31, no.3, p.219-25 (1983). In German.
An ultrasonic apparatus working according to the impulse-echo-method of Mcskimin is changed in such a manner that measurements according to the impulse-overlap-method Papadakis are also possible. The electronic equipment is described and some experimental results are presented. (5 refs.)

100991 An experimental evaluation of the Neyman-Pearson detector. J.Woods, A.J.Estes (Appl. Res. Labs., Univ. of Texas, Austin, TX, USA).
J. Acoust. Soc. Am. (USA), vol.74, no.2, p.518-26 (Aug. 1983).
Several aspects of the discrete time Neyman-Pearson detector are investigated using experimental acoustic data. The problem considered is the detection of a known signal in a surface reverberant environment. The Neyman-Pearson detector is formulated with a given noise ensemble, and then employed to detect a known signal in that noise field. The noise background consists of sonar returns obtained by directing the transmitter and receiver array toward the wind driven surface of a freshwater lake. The noise process is assumed Gaussian with a known covariance matrix, which is estimated with an ensemble average over the reverberation events. Data for the known signal consist of a single echo from a Styrofoam sphere recorded with no measurable reverberation present. Signal plus noise returns are created by adding samples of the target return to samples of the reverberation returns at specified signal-to-noise ratios (S/N). The performance of the detector is obtained experimentally and compared to the performance predicted from theoretical considerations based on the Gaussian assumption and the empirical covariance matrix. The performance is investigated as a function of S/N, number of channels, and transmission type. Two types of transmission are employed, a 1.0-ms pulsed continuous wave (CW) signal with a 10-kHz sweep centered at 80 kHz. The degradation of the detector's performance due to simplifying assumptions that have been placed on the noise process is investigated. The Neyman-Pearson detector using the experimental data displays the following improvements in performance over the simple matched filter: 12 dB for the CW data and 9 dB for the LFM data. (16 refs.)

100992 Robust detector for narrow-band signals in non-Gaussian noise. J.G.Shin (Dept. of Electrical Engng. & Computer Sci., Stevens Inst. of Technol., Hoboken, NJ, USA), S.A.Kassam.
J. Acoust. Soc. Am. (USA), vol.74, no.2, p.527-33 (Aug. 1983).
For the detection of a bandpass signal with Rayleigh amplitude and uniform phase, the authors first show the degradation in performance of the square-law detector when the in-phase and quadrature noise components have small degrees of non-Gaussian contamination. A robust detector using limiter-squarers instead of square-law characteristics to limit the influence of occasional, large observations is proposed. Specific numerical results illustrate the considerable advantage of the robust structure when small degrees of deviation occur from the nominal Gaussian assumption. (15 refs.)

100993 Surface acoustic wave measurements using an impulsive converging beam. K.Yamanaka (Mech. Engng. Lab., Ibaraki, Japan).
J. Appl. Phys. (USA), vol.54, no.8, p.4323-9 (Aug. 1983).
A method for velocity and attenuation measurement of leaky surface acoustic wave on small areas of a solid surface was developed. This technique uses an impulsive converging beam generated with an acoustic lens. Reflected waves from a sample consisted of the axial wave and the leaky surface wave separated in time domain. From the time interval between these waves, the velocity of the leaky surface wave is determined using an expression derived along with ray optics. Because time interval measurements do not require any mechanical scanning, they can be done without special attention paid for mechanical precision of the scanning system, enabling rapid and simple measurement. Since the impulsive wave has a broad frequency spectrum, spectroscopic analysis of leaky surface wave is also possible. Frequency dependent attenuation measurement of leaky surface acoustic waves on heat treated steels and velocity dispersion measurement of leaky surface wave on titanium nitride film on tool steel are demonstrated. (14 refs.)

100994 The improvement of axial resolution in ultrasonic testing with controlled signals. H.-A.Crostack, H.Morlo.
Mater. Test. (Germany), vol.25, no.7, p.231-4 (July 1983). In German.
The equipment arrangement for ultrasonic testing comprises the ultrasonic transmitter, test-piece and optimisation unit. A schematic diagram summarises the layout of the components, viz: transmission unit, amplifiers, impedance changer, display unit, transmission receiver and process computer. The spectrum of the received signal is represented by a product of functions, some squared, denoting the spectra of the circuit components. Amplitude/time and amplitude/frequency characteristics of the transmitted and echoed signals are shown. Optimisation is achieved by using a transmission spectrum with signal amplitude augmented for the higher frequencies by introducing a positive exponent of the attenuation coefficient (alpha) given by $K(A).f^1$ plus $K(S).f^n$ where K(A,S) are the absorption and diffusion factors, f is the frequency and n is 2 for stochastic scattering and 4 for Rayleigh scattering. (14 refs.) *G.C.*

100995 Analysis of ultrasonic field images obtained in air by means of a liquid-crystal film. F.F.Legusha, V.A.Murga, A.N.Slavin (Shipbuilding Inst., Leningrad, USSR).
Sov. Phys.-Acoust. (USA), vol.29, no.1, p.47-50 (Jan.-Feb. 1983). Translation of: *Akust. Zh. (USSR)*, vol.29, no.1, p.84-7 (Jan.-Feb. 1983).
The results are given from a theoretical and exerimental study of the ultrasonic field in an air gap between two planes, one of which contains a circular radiating transducer. The field is visualized by means of a cholesteric liquid-crystal film. (8 refs.)

100996 Influence of periodic nonuniformities of the element directivity patterns on the directivity pattern of a planar acoustic array. M.D.Smaryshev.
Sov. Phys.-Acoust. (USA), vol.29, no.1, p.58-9 (Jan.-Feb. 1983). Translation of: *Akust. Zh. (USSR)*, vol.29, no.1, p.101-3 (Jan.-Feb. 1983).
The influence of a periodic nonuniformity in the directivity patterns of the individual elements of planar acoustic arrays on the directivity patterns of the total arrays is investigated for two cases of array nonuniformities, the period of which is two and three times the spacing period of the elements. (no refs.)

100997 Numerical modeling of the diffraction problem for an ultrasonic interferometer. A.S.Khimunin (V.P. Vologdin All-Union Sci.-Res. Inst. of High-Frequency Currents, USSR).
Sov. Phys.-Acoust. (USA), vol.29, no.1, p.65-7 (Jan.-Feb. 1983). Translation of: *Akust. Zh. (USSR)*, vol.29, no.1, p.113-16 (Jan.-Feb. 1983).
The results of a computer-aided solution of the model problem for an ultrasonic interferometer with a plane circular radiator of finite radius and a plane movable reflector are reported and analyzed. The diffraction structure of the response curve and the diffraction corrections to the measured values of the phase velocity and attenuation of ultrasound are calculated. (14 refs.)

100998 Loudspeaker measurements simplified. P.F.Dobbins.
Wireless World (GB), vol.89, no.1571, p.32-5 (Aug. 1983).
Acoustic measurement techniques designed to avoid the vagaries of personal prejudice and room acoustics normally require a calibrated microphone. Using the principle of reciprocity three transducers can be calibrated with reasonable accuracy and no specialized equipment. (6 refs.)

100999 On the effect of evaluating the time, when measuring sound levels, on the realisation of the equivalent energy principle. G.Fuder (Sektion Informationstech., Tech. Univ. Dresden, Dresden, Germany).
Z. Elektr. Inf.- & Energietech. (Germany), vol.13, no.3, p.259-75 (1983). In German.
The change from analogue methods of processing the measured data on acoustic problems to digital methods, involving highly integrated circuits which facilitate the achievement of a much more extensive range of processing methods, requires, according to the author, the development of algorithms which will provide the acoustic engineer with more exact information than is provided by the usual analogue methods. The behaviour of a sound pressure curve with respect to time is too complex for representation by analytical functions. The sound level is obtained on a logarithmic scale using average values for the squares of the sound pressure amplitudes modified by time and frequency measurements to obtain these average values. Because rapid fluctuations in the instantaneous sound level can occur, purely digital methods of display are not practical. The author also discusses the extent to which the energy equivalence principle can be practically used for the determination of sound levels. The digital methods of processing the measured data, however, enable the energy equivalence principle to be realized with much less restricted boundary conditions. This facilitates the determination of the equivalent sound level, especially when logging pulsed sound pressure functions of time. (10 refs.) *G.W.*

101000 Acoustic lenses - Focusing in on defects. C.A.Kittmer.
Report AECL-7981, Atomic Energy Canada Ltd., Chalk River, Ont. (March 1983), 18 pp.
The following topics were dealt with: acoustic lenses focus ultrasound to produce pencil-like beams with reduced near fields. When fitted to conventional (flat-faced) transducers, such lenses greatly improve the ability to detect and size defects. This paper describes a program developed to design acoustic lenses for use in immersion or contact inspection, using normal or angle beam mode with flat or curved targets. Lens surfaces are circular in geometry to facilitate machining. For normal beam inspection of flat plate, spherical or cylindrical lenses are used. For angle beam or curved surface inspections, a compound lens is required to correct for the extra induced aberration. Such a lens is aspherical with one radius of curvature in the plane of incidence, and a different radius of curvature in the plane perpendicular to the incident plane. The resultant beam profile (i.e. location of the acoustic focus, beam dimater, 6 dB working range) depends on the degree of focusing and the transducer used. The operating frequency and bandwidth can be affected by the instrumentation used. Theoretical and measured beam profiles are in good agreement. Various applications, from zone focusing used for defect sizing in thick plate, to line focusing for pipe weld inspection, are discussed. (4 refs.)

43.88 TRANSDUCTION; DEVICES FOR THE GENERATION AND REPRODUCTION OF SOUND

101001 Particle velocity near-fields of disc radiators with variable drive. D.A.Hutchins (Dept. of Phys., Queen's Univ., Kingston, Ontario, Canada), J.A.Archer-Hall.
Acustica (Germany), vol.53, no.3, p.123-31 (July 1983).
A limited series method has been used to evaluate the particle velocity in the near-field of disc and ring radiators. The use of a simultaneous equation technique to find the coefficient for each term in the series makes it possible to fit boundary conditions defined in terms of either particle velocity or pressure, with the additional advantage that these parameters can be constant or variable. Results given here have all assumed an infinite rigid baffle, and compare favourably with those obtained by surface integral techniques for a constant particle velocity across the radiator's front face. Further studies have shown that resultant diffraction patterns are substantially modified when the particle velocity varies progressively across the front face in a well-defined manner. (15 refs.)

101002 Principle of piezoelectric frequency-tunable transducer. Wang Chenhao, Zhao Zheying (Inst. of Acoustics, Acad. Sinica, Peking, China).
Chin. Phys. (USA), vol.3, no.2, p.493-500 (April-June 1983).
The effect of an electric load on the characteristics of piezoelectric vibration systems was presented in the authors' recent papers. The resonance frequency of such systems can be changed continuously with the electric load. In accordance with this effect, the piezoelectric-tunable transducer has been built. In this paper, the principle of the piezoelectric-tunable transducer is demonstrated, the tuning of the sandwich piezoelectric transducer is analyzed theoretically, and a sandwich transducer of a longitudinal vibrating bar with field parallel to the length is investigated experimentally. The theoretical and experimental results show that such piezoelectric-tuning is available in three second octaves. The tuning is convenient for the piezoelectric-tunable transducers, and can be carried out continuously and instantaneously. (4 refs.)

The influence of electrical grouping of resonant electroacoustic transducers on the parameters of a radiating line array is investigated. (6 refs.)

101005 Effect of bevelling on the thickness vibration of high-frequency Pb(ZrTi)O_3 ceramic transducers. H.Hatano, J.Oosumi (Res. Lab. of Precision Machinery & Electronics, Tokyo Inst. of Technol., Yokohama, Japan).
Ultrasonics (GB), vol.21, no.5, p.205-10 (Sept. 1983).
The effects of bevelling on the thickness vibration of Pb(ZrTi)O_3 piezoelectric-ceramic disc transducers for generating high-frequency ultrasonic power were studied by measuring electrical characteristics and displacement distributions. A laser heterodyne system was employed for the contact-free measurement of vibration. It was shown for a wide range of diameter-to-thickness ratios that bevelling circular edges was effective in reducing the coupled radial vibrations and enhancing the uniform thickness vibration. The vibration characteristics required for generating high-frequency ultrasound were substantially improved by slight bevelling. These results were accounted for by energy trapping of thickness vibration and by the consequent decrease in the equivalent mass of the transducers. (10 refs.)

44.10 HEAT CONDUCTION (MODELS, PHENOMENOLOGICAL DESCRIPTION)

101007 Convergence of statistical finite element solutions of the heat equation with a random initial condition. S.Tasaka (Dept. of Regional Planning, Toyohashi Univ. of Technol., Toyohashi, Japan).
Comput. Methods Appl. Mech. & Eng. (Netherlands), vol.39, no.2, p.131-6 (Aug. 1983).
Previously (see ibid., vol.29, p.109 1981) the author analysed the stability of a finite element scheme for the one-dimensional heat equation with a random initial condition. The author now examines the convergence of statistical finite element solutions to the same problem. The goal of the convergence study is to show that the error of finite element solutions is bounded by some quantities of finite values the magnitude of which may or may not be evaluated, and that the error goes to zero as h and Δt go to zero. In statistical cases, one can define several kinds of solutions to a given problem, i.e. a random function satisfying the governing stochastic equation and some other auxiliary conditions, statistical quantities of the random function, its probability distributions, etc. The author confines the analysis to the first two 'solutions' as already made in the previous paper. Hence, 'finite element solutions' have also these two different meanings. The latter solution, referred to as statistical finite element solutions, may be more important for practical purposes. (5 refs.)

101008 An analytic method for solution of nonlinear inverse problems of heat conduction. A.A.Aleksashenko.
Power Eng. (J. Acad. Sci. USSR) (USA), vol.20, no.3, p.118-26 (1982). Translation of: *Izv. Akad. Nauk SSSR Energ. & Transp.*, vol.20, no.3, p.122-30 (1982).
An analytic method is given for solution of certain nonlinear inverse problems of heat conduction; it utilizes 'model' solutions to evaluate the unknown quantities. Sample calculations are given. (9 refs.)

101009 A discretized-intensity method proposed for two-dimensional systems enclosing radiative and conductive media. T.M.Shih, Y.N.Chen (Dept. of Mech. Engng., Univ. of Maryland, College Park, MD, USA).
Numer. Heat Transfer (USA), vol.6, no.2, p.117-34 (April-June 1983).
A method has been developed for numerically solving two-dimensional radiative and conductive problems. Unlike conventional approaches in which the radiative fluxes are assumed to be one-dimensional, the proposed method bypasses the unnecessary use of the integrodifferential energy transport equation and accounts for the two-dimensionality of the radiative fluxes. Energy conservation is directly taken within a circular control volume. In addition, nodal intensities in four directions are introduced as unknowns. The system of nonlinear algebraic equations is closed with the aid of the equation of transfer in the discretized form. With such a formulation, it is possible to derive, for any grid point j, a set of generalized equations that are readily applicable to other grid points simply by changing the indices; the radiation that arrives at the control volume from remote areas does not explicitly appear in the algebraic equations, but is implicitly accounted for. (see also 47.25Q Convection and heat transfer)

101010 Generalised nonstationary temperature fields in a half-space with cylindrically-elliptical plane. N.V.Golets', M.P.Lenyuk.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.6, p.60-4 (1983). In Ukrainian.
The method of fundamental functions is used to solve the problem of the structure of a generalized nonstationary temperature field in a homogeneous isotropic space with a cylindrically elliptic cavity under the assumption that the cavity boundary is maintained under preset heat conditions, and that the half-space boundary allows heat exchange according to the Newton generalized law. (7 refs.)

101011 Thermal instability of two-dimensional stagnation-point boundary layers. K.Chen, M.M.Chen, C.W.Sohn (Dept. of Mech. & Industrial Engng., Univ. of Illinois, Urbana, IL, USA).
J. Fluid Mech. (GB), vol.132, p.49-63 (July 1983).
A study of thermal instability for the two-dimensional stagnation flow for Prandtl numbers ranging from 0.7 to infinity is presented. The analysis represents an exact solution since neither the boundary-layer approximation nor the parallel-flow assumption was invoked. Of particular interest is that the critical Rayleigh number and the critical wavenumber, when defined on the basis of the thermal boundary-layer lengthscale, are found to be relatively insensitive to the Prandtl number for the range of Prandtl numbers studied. 44.30 HEAT TRANSFER IN INHOMOGENEOUS MEDIA AND THROUGH INTERFACES

101012 The existence and stability of regions with superheating in the classical two-phase one-dimensional Stefan problem with heat sources. A.A.Lacey, M.Shillor (Math. Inst., Oxford Univ., Oxford, England).
IMA J. Appl. Math. (GB), vol.30, no.2, p.215-30 (March 1983).
It is proved that in one-dimensional two-phase Stefan problem regions with superheating (supercooling) appear when sufficiently strong volume heat sources (sinks) are present. The stability of the problem with superheating is considered. It is proved that when the heat flux, on the free boundary, from the solid is greater than that from the liquid then the free boundary is linearly unstable against three-dimensional perturbations. From these results it follows that the classical model for the melting of a metal under Joule heating has a linearly unstable free boundary. Such models are applicable to the electrical welding of metals. (18 refs.)

101013 Vapour bubble formation during fast transient boiling on a wire. K.Derewnicki (Simon Engng. Labs., Univ. of Manchester, Manchester, England).
Int. J. Heat & Mass Transfer (GB), vol.26, no.9, p.1405-8 (Sept. 1983).
The author investigates the heat transfer mechanisms accompanying rapid heating of a fine platinum wire (0.025 mm in diameter) immersed in subcooled water at a range of pressures up to 14 bar and of rates of increase of the heating surface temperature up to $10^7 K\ s^{-1}$. With such rapid heating, especially at elevated pressures, nucleation occurs in a homogeneous rather than heterogeneous manner. The results presented, were obtained from transient boiling tests with relatively low heating rates, i.e. below $10^6 K\ s^{-1}$ and at atmospheric pressure. Such rates of heating were found to lead to stable nucleate boiling following a brief period of local and highly unstable film boiling. (7 refs.)

101014 Heat-transfer rate on boiling in the presence of scaling. V.I.Tolubinskii, V.A.Antonenko, G.R.Kudritskii, Yu.N.Ostrovskii (Inst. of Tech. Heat Phys., Acad. of Sci., Kiev, Ukrainian SSR).
J. Eng. Phys. (USA), vol.43, no.6, p.1360-2 (Dec. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.6, p.942-5 (Dec. 1982).
Deactivation of vapor-formation centers is decisive in producing the temperature rise at a heating surface when deposits are formed on it. (4 refs.)

J. Eng. Phys. (USA), vol.43, no.6, p.1362-9 (Dec. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.6, p.945-55 (Dec. 1982).
The interaction of a superheated surface with a drop impinging upon it is treated in the quasistationary approximation, neglecting dissipative effects. (21 refs.)

101016 Numerical computation using finite elements for the moving interface in heat transfer problems with phase transformation. J.Yoo, B.Rubinsky (Dept. of Mech. Engng., Univ. of California, Berkeley, CA, USA).
Numer. Heat Transfer (USA), vol.6, no.2, p.209-22 (April-June 1983).
A numerical method involving finite elements is presented for the solution of multidimensional problems of heat transfer with phase transformation. Specific to the method is that both the energy equation in the media and the energy equation on the change of phase interface are regarded as independent governing equations which, when solved through the use of a finite-element formulation, yield the temperature distribution in the media as well as the continuous displacement of the interface. Specific examples illustrate the ability of the method to handle problems with arbitrary boundary conditions which result in irregular two-dimensional shapes of the change of phase interface. (18 refs.)

101017 Thermal conductivity of plastic foams. R.J.J.Williams, C.M.Aldao (Inst. of Materials Sci. & Technol., Univ. of Mar del Plata, Mar del Plata, Argentina).
Polym. Eng. & Sci. (USA), vol.23, no.6, p.293-8 (April 1983).
A simple equation enabling the prediction of the thermal conductivity of plastic foams, without the aid of adjustable parameters, is proposed. The equation is based on a recurrent method, previously developed, that showed reasonable agreement with experimental results. Ways of decreasing the thermal radiation contribution are shown. In particular, the influence of cell size, radiation transmission through solid membranes and low-emissivity boundary surfaces are analyzed. Errors involved in steady techniques of measuring the thermal conductivity associated with radiation are discussed. (3 refs.)

101018 Characteristics of nucleate pool boiling from porous metallic coatings. A.E.Bergles, M.C.Chyu (Dept. of Mech. Engng., Iowa State Univ., Ames, IA, USA).
Trans. ASME. J. Heat Transfer (USA), vol.104, no.2, p.279-85 (May 1982).
A study of pool boiling from a commercial porous metallic matrix surface is reported. The excellent steady boiling characteristics of this type of surface are confirmed; however, high wall superheats are required in most cases to initiate boiling. The resultant boiling curve hysteresis does not appear to have been previously reported in the literature. This effect is indicated in recent pilot plant tests. The present results generally confirm the speculated mechanism of boiling with these surfaces and suggest reasons whereby single-tube performance may be superior to tube bundle performance. (29 refs.)

101019 Effects of pore diameters and system pressure on saturated pool nucleate boiling heat transfer from porous surfaces. W.Nakayama, T.Daikoku, T.Nakajima (Mech. Engng. Res. Lab., Hitachi Ltd., Ibaraki, Japan).
Trans. ASME. J. Heat Transfer (USA), vol.104, no.2, p.286-91 (May 1982).
The porous surface structure was manufactured with precision from the experimental study of nucleate boiling heat transfer in R-11. Boiling curves and the data of bubble formation were obtained with a variety of geometrical and operational parameters; the pore diameters were of 50, 100, 150 μm, there was a combination of pores of different sizes; and the system pressures were of 0.04, 0.1, 0.23 MPa. The boiling curves exhibit certain trends effected by the diameter and population density of pores. A combination of high system pressure and pore sizes of 100 or 150 μm dia enables boiling to persist even when the wall superheat is reduced to an extremely low level of 0.1K. A noteworthy feature of porous surface boiling is than intense bubble formation does not necessarily yield a high heat-transfer performance. Examination of the data indicates that liquid suction and evaporation inside the cavities are a probable mechanism of boiling with small temperature differences. (9 refs.)

101020 Pool boiling heat transfer from enhanced surfaces to dielectric fluids. P.J.Marto, Lt.V.J.Lepere (Dept. of Mech. Engng., Naval Postgraduate School, Monterey, CA, USA).
Trans. ASME. J. Heat Transfer (USA), vol.104, no.2, p.292-9 (May 1982).
Pool boiling heat-transfer measurements were made using a 15.8 mm OD plain copper tube and three copper enhanced surfaces. The dielectric fluids were Freon-113 and Fluorinert FC-72, a perfluorinated organic compound manufactured to cool electronic equipment. Data were taken at atmospheric pressure, and at heat fluxes from 100 W/m^2 to 20000 W/m^2. Prior to operation, each test surface was subjected to one of three aging procedures to observe the effect of surface past history upon boiling incipience. For Freon-113 the enhanced surfaces showed a two to tenfold increase in the heat-transfer coefficient when compared to a plain tube, whereas for FC-72 an increase of two to five was measured. The high flux surface gave the best performance over the range of heat fluxes. The GeWa-T surface did not show as much of an enhancement at low fluxes as the other two surfaces, but at high fluxes its performance improved. In fact, it was the only surface tested which delayed the onset of film boiling with FC-72. The degree of superheat required to active the enhanced surfaces was sensitive to both past history of the surface and to fluid properties. (22 refs.)

44.40 RADIATIVE HEAT TRANSFER

101021 Model approximations in radiative heat-exchange calculations. V.I.Adrianov.
Power Eng. (J. Acad. Sci. USSR) (USA), vol.20, no.3, p.156-61 (1982). Translation of: *Izv. Akad. Nauk SSSR Energ. & Transp.*, vol.20, no.3, p.159-64 (1982).
The way in which the process of radiative heat exchange is affected by selectivity and anisotropy of the optical properties of materials has been investigated for a system of two parallel, optically smooth surfaces separated by a diathermal medium. Various model approximations are considered that simplify study of the process but distort its actual physical pattern. This problem has been solved both in exact formulation and by computer on the basis of approximations. The results of the exact solution are compared with model approximations; this makes it possible to judge the accuracy of approximate computational schemes and their comparative advantages. (9 refs.)

101022 'Equilibrium' approximations in theory of radiative heat transfer. V.N.Adrianov (Moscow Inst. of Steel & Alloys, Moscow, USSR).
J. Eng. Phys. (USA), vol.43, no.6, p.1398-403 (Dec. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.6, p.989-95 (Dec. 1982).
Two methods are proposed for approximately taking into account the selectivity and anisotropy of radiation characteristics in calculation of radiative heat transfer. Both methods are shown to be sufficiently reliable and effective. (1 ref.)

101023 Temperature distribution in thin films receiving radiant energy. M.A.Gurbanyazov, I.S.Lisker, M.B.Pevzner (Sci.-Res. Inst. of Agrophys., Leningrad, USSR).
J. Eng. Phys. (USA), vol.43, no.6, p.1403-6 (Dec. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.6, p.995-9 (Dec. 1982).
An expression is derived for estimating the temperature distribution in thin metal and semiconductor films locally receiving radiant energy. (12 refs.)

101024 The Galerkin method for solving radiation transfer in plane-parallel participating media. M.N.Ozisik (Mech. & Aerospace Engng. Dept., North Carolina State Univ., Raleigh, NC, USA), Y.Yener.
Trans. ASME. J. Heat Transfer (USA), vol.104, no.2, p.351-4 (May 1982).
The Galerkin method is applied to solve radiative heat transfer in an isotropically scattering, absorbing, and emitting plane-parallel medium with diffusely reflecting boundaries. In this approach, the integral form of the equation of radiative transfer is transformed into a set of algebraic equations for the determination of the expansion coefficients associated with the representation of the incident radiation in a power series in the space variable. The method is easy and straightforward to apply and requires relatively little computer time for the computations, since explicit analytical expressions are obtainable for the expansion coefficients. (16 refs.)

101025 View factors in radiation between two parallel oriented cylinders of finite lengths. N.H.Juul (Dept. of Mech. & Aerospace Engng., State Univ. of New York, Amherst, NY, USA).
Trans. ASME. J. Heat Transfer (USA), vol.104, no.2, p.384-8 (May 1982).
A simple double-integral expression for the diffuse radiation view factor, F_{12}, between two parallel cylinders of finite lengths is derived. No closed-form solution appears possible except for the limiting case of infinite long cylinders for which an analytical expression for the view factor ${F_{12}}^{\infty}$ is derived by applying the crossed string method. The accuracies of the line source approximations are evaluated, and the regions for which they are accurate to one percentage or better are identified. The view factor F_{12} between two opposing cylinders of equal length is computed by numerical integration and normal-

ized by F_{12}^{∞}. The results are presented. Analytical expressions, which approximate the view factors between two opposite cylinders of finite length, are derived and their accuracy is evaluated over a useful parameter range. The range of their applications corresponds approximately to that for the line source approximation. This result is expected, because the errors are caused in part by blockage of radiation which is similar. (7 refs.)

101026 Calculation of the temperature regimes for the fine anneal of quartz discs. E.I.Shyb (State Sci.-Res. Inst. of Vitreous Silica, Leningrad, USSR).
Sov. J. Glass Phys. & Chem. (USA), vol.8, no.4, p.335-40 (July-Aug. 1982). Translation of: *Fiz. & Khim. Stekla (USSR)*, vol.8, no.4, p.484-90 (July-Aug. 1982). [received: May 1983]
On the basis of a diffusion approximation, a method of calculating the heat transfer in large blanks made of vitreous silica of thickness >0.20 m and diameter >1 m has been developed. This method is based on the introduction of a coefficient of radiation thermal conductivity obtained by averaging the length of the radiation free path in relation to the spectrum as is valid for large discs. A calculation was made for the fine anneal of a disc made from KV vitreous silica enclosed in a brick capsule with third-order boundary conditions. From the temperature distributions obtained the thermal stresses were calculated along the radius of the disc since these are much greater than the stresses along the axis. The results of the calculations show that the temperature distribution in the disc is independent of the reflection coefficient of the brick capsule in the case of large blanks of diameter >1 m and thickness >0.2 m. The use of the free convection in the annealing furnace with linear cooling of the gas carrier until the final annealing temperature T_f was established followed by a maintenance of the gas temperature T_s at this value until the critical cooling of the glass had finished and also the maintenance of radiative equilibrium between the furnace walls and the capsule enclosing the disc made it possible to choose those regimes from all those considered which ensure that the glass is annealed in accordance with the established technical requirements: in relation to optical uniformity, up to 5 deg/h; and residual stresses, to 40 deg/h. 101027 Stationary singular surfaces in materials with scalar internal variables. E.Matsumoto (Dept. of Aeronaut. Engng., Kyoto Univ., Kyoto, Japan).
Arch. Mech. (Poland), vol.34, no.4, p.477-83 (1982).
There can exist stationary discontinuity surfaces of the second deformation gradient in a three-dimensional material with scalar internal variables. Explicit expressions for the growth and decay of the discontinuities are obtained. For a material with an unknown number of scalar internal variables, a method is proposed to find a lower bound for the number of the scalar internal variables, by observing the variation of such discontinuities. (17 refs.)

101028 Thermodynamic influences on stationary singular surfaces in materials with scalar internal variables. E.Matsumoto (Dept. of Aeronatical Engng., Kyoto Univ., Kyoto, Japan).
Arch. Mech. (Poland), vol.34, no.4, p.485-91 (1982).
Stationary singular surfaces may exist in materials with scalar internal variables. The jump of the second deformation gradient across such a surface behaves, under thermodynamic influences, as if the number of the scalar internal variables were increased by one. In other words, the entropy plays the same role as a scalar internal variable on the variation of the discontinuity. As a result, stationary singular surfaces may also exist in a thermoelastic material. (6 refs.)

101029 Solution of dynamic noncircular cylindrical shell problems in liquids. S.A.Borobiov.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.5, p.28-31 (1983). In Ukrainian.
Presents a boundary form perturbation method for solving problems of noncircular cylindrical shell dynamics in liquids. (8 refs.)

101030 Geometrically nonlinear mechanics in discrete system and application to plane frame-works. M.Ai (Dept. of Civ. Engng., Hosei Univ., Tokyo, Japan), F.Nishino.
J. Fac. Eng. Univ. Tokyo Ser. B (Japan), vol.36, no.4, p.745-75 (Sept. 1982).
A general expansion for the geometrically nonlinear mechanics in discrete structural systems is presented, in which the freedom of elemental position is resolved into the elemental deformation and the elemental rigid displacement, and which is applicable to any large displacements. The general expansion is given the specification for plane frame-works, in which a new solution for the elemental deformation is shown to contain more nonlinearity than that of the beam-column theory. The convergence of the discrete solution towards an infinitesimal subdivision of elements is studied on the geometrical nonlinearity. (23 refs.)

101031 Application of the hybrid method of finite elements to strength analysis of axially symmetric shell-plate structures. Z.Dzygadlo, I.Nowotarski.
J. Tech. Phys. (Poland), vol.23, no.2, p.167-78 (1982).
In the displacement method of finite elements, the displacement functions were assumed to be in the form of polynomials, for which the total number of their coefficients α_n was equal to the number of degrees of freedom of the element under consideration. For the one-dimensional element, having the form of a truncated cone, the total number of degrees of freedom was 6, therefore, the displacement functions u and w could be approximated by first and third degree polynomials. The fact that the displacements inside an element were approximated by low-degree polynomials influenced in a disadvantageous manner the accuracy of computation of the deformations of middle surfaces of the system. These deformations were determined from strain-displacement relations, which require differentiation, so the accuracy of the rigidity matrix thus obtained was reduced. This is a drawback in the case of elasticity problems, since discontinuities of stress occur in some cases across boundaries between elements. To avoid such difficulties an attempt was made to apply the hybrid method of finite elements for the construction of the stiffness matrix of a conical shell element. (11 refs.)

101032 Comparison of two slideline methods using ADINA. F.M.Guerra, R.V.Browning (Design Analysis Div., Los Alamos Nat. Lab., Los Alamos, NM, USA).
Comput. & Struct. (GB), vol.17, no.5-6, p.819-34 (1983). (Proceedings of the 4th ADINA Conference, Cambridge, MA, USA, 15-17 June 1983).
Two general methods of treating sliding interface problems were implemented in ADINA. The first method uses constraint equations and is based on the work of Taylor, Hughes et al. (1974). The second method is a penalty function method where finite stiffness are used to simulate the contact forces. This is similar to the method used by Hallquist (1982) in NIKE2D. These may be used as notension sliding interfaces, with or without friction, or as a nonsliding interface to interpolate between different mesh regions. The authors briefly review the theory behind these methods and describe the implementation in ADINA. Several application problems have been run, including metal forming problems. Based on this experience the methods are compared in terms of ease of use, accuracy, reliability, influence on bandwidth, and solution time. Neither method is ideal. The penalty method is generally more efficient but may be inaccurate, whereas the constraint equations are accurate but less efficient. (13 refs.)

101033 Solving the static problem of rotation shells with additional supports. A.T.Vasilenko, Ya.M.Grigorenko, T.I.Polishchuk.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.6, p.4-6 (1983). In Ukrainian.
Presents an approach to the solution of problems of statics for shells of revolution on additional supports, certain displacements coming to zero. A solution is presented for a problem of a toroidal noncircular-section shell on a stiff support. (8 refs.)

101034 Structural model of a medium for complex nonisothermal loading processes. Yu.M.Shevchenko, E.I.Zakon.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.6, p.42-6 (1983). In Ukrainian.
Deals with the structural model of a medium describing nonisothermal complex processes of loading and processes of loading according to two-link trajectories of deformation in particular. (8 refs.)

101035 Elastic property anisotropy dependence of fibre composite material on its structure. G.T.Golovchan, N.I.Nikityuk.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.6, p.68-71 (1983). In Ukrainian.
Composites with double-periodic arrangement of fibres are considered. The effective moduli of elasticity are obtained on the basis of a rigorous solution of a boundary value problem. The dependence of elastic property anisotropy on the structure parameters is also studied. (6 refs.)

101036 A new approach to the dynamic analysis of structures using fixed frequency dynamic stiffness matrices. A.J.Fricker (Central Electricity Res. Labs., Leatherhead, England).
Int. J. Numer. Methods Eng. (GB), vol.19, no.8, p.1111-29 (Aug. 1983).
The dynamic analysis of structures by the standard finite element method introduces additional inaccuracies into the solution which are not present when the method is used for static analyses. These inaccuracies can arise from two sources: (i) the element formulation and (ii) the reduction of the size of the matrices by a static condensation. The errors in both cases are caused be neglecting frequency-dependent terms in the functions relating the displacements at any point in the structure to the displacements at certain fixed points. The author proposes a new method of solution in which the

frequency-dependent terms are retained implicitly by using dynamic stiffness matrices defined at a number of fixed frequencies. The dynamic stiffness matrices may be condensed efficiently to a relatively small number of master degree-of-freedom using a front solution algorithm. The final stage in the solution uses these matrices to synthesize a high-order eigenvalue problem. Numerical examples are given to show the accuracy and efficiency of the proposed method compared with conventional methods of solution. (14 refs.)

101037 Finite element techniques for problems of unbounded domains. F.Medina (John A. Blume & Associates, Berkeley, CA, USA), R.L.Taylor.
Int. J. Numer. Methods Eng. (GB), vol.19, no.8, p.1209-26 (Aug. 1983).
A general approach for using infinite elements within the context of the finite element method is presented. Based upon Gauss-Laguerre quadrature, a scheme for numerically computing the infinite element characteristic matrices is proposed. The general formulation of the element shape functions is outlined, including that for infinite elements that model the far field of hyperbolic systems. The technique is illustrated with a classical example in elasticity: a vertically loaded circular rigid plate. (21 refs.)

101038 A geometrically nonlinear theory of thin-walled beams. M.Ai (Dept. of Civ. Engng., Hosei Univ., Tokyo, Japan), F.Nishino.
J. Fac. Eng. Univ. Tokyo Ser. B (Japan), vol.36, no.4, p.713-43 (Sept. 1982).
The geometrically nonlinear behavior of thin-walled beams is formulated into governing equations within the condition of small strains, but without any restriction to the magnitude of displacements. The relative in-plane displacement within a cross-section is taken into account as well as the warping. By employing a transformed geometrical variation from the direct variation of independent parameters in the kinematic field, the variational calculus is simplified to yield an explicit solution. The kinematic field is considered directly to the geometry of thin-walled beams regardless of whether before or after deformation, rather than to the displacement from the initial configuration, with an assertion to the treatment of geometrically nonlinear problems. (14 refs.)

101039 Analysis of stressed state of laminate-wound cylindrical shell with friction taken into account. L.A.Il'in, N.A.Lobkova (Inst. of Mech., Acad. of Sci., Kiev, Ukrainian SSR).
Sov. Appl. Mech. (USA), vol.18, no.11, p.993-1000 (Nov. 1982). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.11, p.49-56 (Nov. 1982).
In an earlier study (see ibid., vol.17, no.6, p.59, 1981) a design scheme was described for a thin elastic laminate-wound infinitely long cylindrical shell under an internal pressure load and, from a qualitative analysis of the mode of layer slippage, the authors derived a principle for setting up equations describing the stress-strain state of the shell. The authors demonstrate there that the mode of slippage and thus the form of these equations depends on the magnitude of the friction coefficient. The friction coefficient is thus regarded as a parameter with a continuous range of values and, on this basis, the authors set up equations describing all possible situations. The authors also present a method for solving the corresponding transcendental equations and show how the slip between layers and the forces in layers depend on the magnitude of the friction coefficient for the case of a shell consisting of five turns. (2 refs.)

101040 Refined theory of plates for finite deflections. A.V.Plekhanov, A.P.Prusakov (Dnepropetrovsk Construction-Engng. Inst., Dnepropetrovsk, USSR).
Sov. Appl. Mech. (USA), vol.18, no.11, p.1010-13 (Nov. 1982). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.11, p.70-4 (Nov. 1982).
Considers an elastic transversally isotropoic plate of constant thickness and obtains equations for the equilibrium, boundary conditions and relations between the forces and the displacement using Reissner's variational equation. (4 refs.)

101041 Axisymmetric reinforcement of holes in orthotropic plates. V.K.Kosenyuk (Novosibirsk Inst. of Railroad Transportation Engnrs., Novosibirsk, USSR).
Sov. Appl. Mech. (USA), vol.18, no.11, p.1014-17 (Nov. 1982). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.11, p.75-9 (Nov. 1982).
The presence of a reinforcing ring in a plate weakened by a hole causes a significant stress redistribution in the plate and lowers the stress concentration factors. Various optimality criteria are used to determine the most efficient form of reinforcement of hole edges. The author examines a two-dimensional problem involving a determination of this form for a reinforcing element of constant thickness. The condition of equal strength is satisfied in the plate on the outer contour of the reinforcement. The problem is solved for an infinite orthotropic plate loaded in its own plane with uniform loads in two directions. The method presented also makes it possible to construct solutions for plates of finite dimensions with other loading conditions. (4 refs.)

46.30 MECHANICS OF SOLIDS AND RHEOLOGY

(see also 62.20 Mechanical properties of solids, as related to microscopic structure)

101042 Prestrained elastic laminates: deformations, stability and vibrations. H.Bufler, H.Kennerknecht (Univ. of Stuttgart, Stuttgart, Germany).
Acta Mech. (Austria), vol.48, no.1-2, p.1-30 (1983).
For a general elastic laminate consisting of different transversely isotropic plane layers an exact (but expensive) method for the calculation of the deformations, stability and eigenvibrations is discussed. The specialization to a laminate composed of alternating stiff reinforcing sheets and soft matrix layers (special discrete model), however, allows a considerable simplification. It is shown how this regular laminate (=inhomogeneous classical continuum) may be approximated by a homogeneous continuum with couple stresses using a suitable limiting process (continuum model). This model corresponds to a restricted Cosserat continuum and enables the derivation of closed formulas for the displacements, critical loads, and eigenfrequencies. Numerical results are worked out on the basis of the discrete and continuum model respectively and compared with each other. (27 refs.)

101043 Thermodynamics and the homogenized thermomechanical behaviour. G.Francfort, Q.S.Nguyen, P.Suquet.
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.14, p.1007-10 (18 April 1983). In French.
The macroscopic thermomechanical behaviour of a heterogeneous medium is investigated through a homogenization method. The study is based upon the knowledge of the microscopic thermomechanical behaviour of this medium. A better understanding of the results obtained is achieved through the notion of accompanying equilibrium state. (4 refs.)

101044 Prognosis of the carrying capacity of structures during strength tests. E.G.Geida, A.G.Makarenkov, V.I.Mossakovs'kii.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.6, p.23-5 (1983). In Ukrainian.
Presents a method for predicting the carrying capacity of structure from the parameters (deformations) measured during tests using the second-order autoregression model and corresponding strength criteria. (3 refs.)

101045 Experimental determination of the stresses in the layers of a multilayered rolled shell. M.I.Burak (Dept. of Central Res. Inst. of Steel Structure Design, Minsk, Belorussian SSR).
Strength Mater. (USA), vol.14, no.6, p.792-6 (June 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.6, p.67-71 (June 1982).
An investigation of the ultimate strength of a multilayered rolled shell. To verify the obtained results, the authors tested a model that was sealed with an elastic packing, pressed against the inner surface of the shell by a rigid cover plate with the aid of an elastic distance rod. After loading the model up to the state of total yield of the wall, they succeeded in recording the strain diagram of the hole circumferentially in the outer and inner layers. As a result equal diagrams were obtained whose processing indicates that the stresses across the wall thickness are uniformly distributed. (13 refs.)

101046 Use of the finite-element method to select the optimum geometric shape of 'T'-connections. V.M.Bogomol'nyi, S.V.Ekhlakov, I.V.Kargapolov.
Strength Mater. (USA), vol.14, no.6, p.804-7 (June 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.6, p.78-80 (June 1982).
A numerical analysis of the stress-strain state of 'T'-connections has been presented (Yulikov and Stasenko 1979). The present authors' aim is to substantiate the method of reducing the concentration of stresses at the point of intersection of cylindrical shells, which arise under loading by internal pressure. The radius of coupling of the cylindrical shells and the shell thickness are assumed to be constant. (9 refs.)

101047 Experimental study of the deformed state of a conical panel. V.I.Kostrov.
Sov. Aeronaut. (USA), vol.25, no.2, p.68-70 (1982). Translation of: *Izv. VUZ Aviats. Tekh. (USSR)*, vol.25, no.2, p.60-2 (1982).
The conical panel under the action of static uniform pressure and dynamic loads was studied in great detail. However, the 'load-deflection' dependence was not obtained in those studies. To establish this relation the author designed and built a test setup which consisted of a housing, curvilinear clamping plank, hydraulic pump, calibrated pressure gauge, hydraulic plumbing and a fixture for mounting the indicators used to record the panel deflection. (2 refs.)

Use of two-dimensional schemes in the finite-element method in calculating the coil system for the toroidal magnetic field in a Tokamak ....See Entry 99728

46.30C Static elasticity

101048 Shock wave in piecewise linear elastic material. Z.Wesolowski (Inst. of Fundamental Technol. Res., Polish Acad. of Sci., Warsaw, Poland).
Arch. Mech. (Poland), vol.34, no.3, p.351-8 (1982).
The six-dimensional deformation space is divided into a number of regions. For each deformation belonging to a fixed region there holds the same linear stress-strain relation. The shock wave propagates in this piecewise-linear elastic material. The general algebraic propagation equations are given and three special cases are discussed. (4 refs.)

101049 A property of the heat equation which extends to the thermoelastic equations. W.A.Day (Oxford Univ., Oxford, England).
Arch. Ration. Mech. & Anal. (Germany), vol.83, no.2, p.99-113 (1983).
The author shows that the heat equation property, deduced from the maximum principle, does extend to the thermoelastic equations. (5 refs.)

101050 A class of biharmonic end-strip problems arising in elasticity and Stokes flow. D.A.Spence (Math. Dept., Imperial Coll. London, London, England).
IMA J. Appl. Math. (GB), vol.30, no.2, p.107-39 (March 1983).
Considers boundary-value problems for the biharmonic equation in the open rectangle $x>0$, $-1<y<1$, with homogeneous boundary conditions on the free edges $y=\pm 1$, and data on the end $x=0$ of a type arising both in elasticity and in Stokes flow of a viscous fluid, in which either two stresses or two displacements are prescribed. For such 'noncanonical' data, coefficients in the eigenfunction expansion can be found only from the solution of infinite sets of linear equations, for which a variety of methods of formulation have been proposed. (22 refs.)

101051 SIMPAT (modular simulator for thermoelastic analyses).
Pixel. Comput. Graphics, CAD/CAM, Image Process. (Italy), vol.4, no.2, p.57-61 (1983). In Italian.
Describes SIMPAT, finite elements package oriented to applications of structural analyses in thermal, static and dynamic fields. The library of elements is explained. A diagram is given of various types of elements and their linear, parabolic and cubic representation. The generation of the mesh is described, with its applications to thermal analyses, static and dynamic analyses. Diagrams of these are given. The final section deals with applications to graphical analyses. *G.V.D.*

101052 A simple and effective pipe elbow element—some nonlinear capabilities. K.-J.Bathe (Dept. of Mech. Engng., MIT, Cambridge, MA, USA), C.A.Almeida, L.W.Ho.
Comput. & Struct. (GB), vol.17, no.5-6, p.659-67 (1983). (Proceedings of the 4th ADINA Conference, Cambridge, MA, USA, 15-17 June 1983).
The authors have previously presented the formulation of a simple pipe elbow element for linear analysis. This formulation is extended to include some nonlinear effects. Elastic-plastic conditions can be modeled, and some kinematic nonlinearities (due to large displacement beam behaviour) can also be represented. The results of some sample solutions are given to illustrate the use of the element. (9 refs.)

101053 On elastic-plastic analysis of *I*-beams in bending and torsion. K.-J.Bathe, P.M.Wiener (Dept. of Mech. Engng., MIT, Cambridge, MA, USA).
Comput. & Struct. (GB), vol.17, no.5-6, p.711-18 (1983). (Proceedings of the 4th ADINA Conference, Cambridge, MA, USA, 15-17 June 1983).
The use of various models is studied to represent an *I*-beam for its elastic-plastic bending and torsional response including warping. The rectangular cross-section 2-node Hermitian beam element, the 4-node isoparametric beam element, and the 9-node isoparametric shell element of ADINA with constraint equations are used to establish the models. The linear elastic and elastic-plastic solutions of a cantilevered *I*-beam are given, and it is concluded

that the *I*-beam model constructed with the isoparametric beam element can be used for general analysis. (8 refs.)

101054 Nonlinear static analysis of end-fittings for GFRP-prestressing rods. M.Keuser (Inst. fur Massivbau, TH Darmstadt, Darmstadt, Germany), B.Kepp, G.Mehlhorn, F.Rostasy.
Comput. & Struct. (GB), vol.17, no.5-6, p.719-30 (1983). (Proceedings of the 4th ADINA Conference, Cambridge, MA, USA, 15-17 June 1983).
Considers research on end-fittings for pretensioned GFRP rods. It is shown that the ADINA-FE-program can be modified by user at reasonable expense for the analysis of structures and materials whose properties cannot be reproduced adequately by the original version of the program. For the analysis of anchorage elements for pretensioned GFRP rods a modified elastic-plastic material model for 2/D-elements and a bond-link-element have been added to the program maintaining completely its modular structure. The modifications are explained and the stiffness matrix for the bond-link-element is derived. With this modified program different types of end-fittings are analyzed with special regard to bond between the GFRP rod and the surrounding synthetic resin material. A comparison of the results of the FE-analysis shows good correspondence to test data. (6 refs.)

101055 On one opportunity of the elimination of volumetric forces in problems of mechanics of the deformable rigid body. L.Kh.Talybly.
Izv. Akad. Nauk Az. SSR Ser. Fiz.-Tekh. & Mat. Nauk (USSR), no.5, p.56-61 (1982). In Russian.
It is shown, that if the operative volumetric forces in the body have a potential, the problem of the mechanics of deformable rigid incompressible body may be reduced to the corresponding problem without volumetric forces. (5 refs.)

101056 Asymptotic investigation of the stressed-deformed condition of the dynamic problem of the theory of the elasticity for the empty cylinder of finite length. M.F.Mekhtiev.
Izv. Akad. Nauk Az. SSR Ser. Fiz.-Tekh. & Mat. Nauk (USSR), no.6, p.28-32 (1982). In Russian.
The axially symmetric dynamic problem of the theory of elasticity for the isotropic empty cylinder is considered. An asymptotic analysis of the stressed-deformed condition of the shell is conducted. Comparison of the asymptotic solution with the solutions obtained by the applied theory is connected. (5 refs.)

101057 On the problem of the analysis of the stress field in a multiply connected round plate depending on the different profile loads. K.A.Aliev.
Izv. Akad. Nauk Az. SSR Ser. Fiz.-Tekh. & Mat. Nauk (USSR), no.6, p.142-7 (1982). In Russian.
Presents the study of a round plate in the stressed state by the method of the theory of the analytical functions of a complex variable. The plate is relaxed by the *N*-quantity of the round holes, when the external profile is influenced by a non-uniformly distributed load and the internal profile is influenced by a uniformly distributed load. The solution of the problem is reduced to an infinite set of linear algebraic equations. Numerical examples are examined and the diagrams of the stresses are plotted. (4 refs.)

101058 Homogenization and linear thermoelasticity. G.A.Francfort (Dept. of Mech. Engng., Stanford Univ., Stanford, CA, USA).
SIAM J. Math. Anal. (USA), vol.14, no.4, p.696-708 (July 1983).
The author studies homogenization of linear dynamic thermoelasticity with rapidly varying coefficients, using a semigroup approach. The resulting homogenized problem exhibits an unusual change in initial temperature. A formal asymptotic analysis predicts fast time oscillations in the temperature field. These oscillations explain the temperature shift, and show that, for this problem, weak convergence in time is the best convergence that one can obtain. (8 refs.)

101059 Application of the potential method to two-dimensional problems of the elastic equilibrium of a region with an irregular boundary. G.N.Karpov, N.V.Kurnosov, V.Z.Parton.
Strength Mater. (USA), vol.14, no.7, p.859-61 (July 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.7, p.3-5 (July 1982).
Investigators are currently paying increasing attention to methods of solving elastic equilibrium problems based on the formulation and numerical solution of contour integral equations. The authors noted the exceptional promise of using integral equations to solve elastic equilibrium problems, especially on the basis of the elastic potential method. Results are presented of an experiment having to do with the solution of the second basic problem of elasticity theory for a plane weakened by a narrow cavity connecting two circular holes. (4 refs.)

101060 Effective methods of accounting for local variation in stiffness characteristics in the finite-element method. A.S.Tsybenko (Kiev Polytech. Inst., Kiev, Ukrainian SSR).
Strength Mater. (USA), vol.14, no.7, p.928-30 (July 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.7, p.62-3 (July 1982).
Use of the finite-element method (FEM) in optimization computations of structures and also for investigation of the inelastic stress-strain state using iteration algorithms of methods of variable elasticity parameters is associated with the need to find repetitive solutions that are distinguished by variation in the stiffness parameters of the individual finite elements. The mathematical essence of the problem in question consists in the successive reforming of the matrix containing the coefficients of the initial system of FEM equations and in the solution of the transformed system by direct or iteration methods. Together with this, another approach, which is examined in detail, can be used in varying the stiffness characteristics of a small number of finite elements. It is based on the introduction of variations in the vector on the right side of the system of FEM equations. The advantages of this method are particularly conspicuous for direct methods of solution of systems of linear algebraic equations. (5 refs.)

101061 Moving load applied to a layer on an acoustic half-space. V.I.Pozhuev (Zaporozhe Industrial Inst., Zaporozhe, USSR).
Strength Mater. (USA), vol.14, no.7, p.971-7 (July 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.7, p.98-101 (July 1982).
Consideration has been given previously to a series of dynamic problems for plates floating on the surface of an ideal liquid of finite and infinite depth applicable to evaluation of an ice mantle. Movement of the mantle has been described by equations for thin plates and a load moving at a constant speed served as an oscillation generator. In order to describe motion of the layer dynamic equations of elasticity theory have been used. Subsonic and supersonic speeds of load motion in relation to the liquid are considered, and a solution is obtained for subseismic, transseismic, and superseismic regimes of motion relative to speeds of wave propagation in the layer. Numerical calculations were carried out for an exponentially decreasing pressure and for a load uniformly distributed over a section of finite length. (7 refs.)

101062 State of thermal stress in a two-temperature half-space with a periodic surface temperature. L.P.Khoroshun, N.S.Soltanov (Inst. of Mech., Acad. of Sci., Kiev, Ukrainian SSR).
Sov. Appl. Mech. (USA), vol.18, no.11, p.977-81 (Nov. 1982). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.11, p.30-4 (Nov. 1982).
On the basis of the equations of two-temperature thermoelasticity the authors investigate the established periodic temperature field as well as the induced stresses in the two-component halfspace. The authors investigate the effect of the difference of the temperatures of the components on the distribution of the thermoelastic stresses in the half-space. (7 refs.)

101063 Solution of the thermoelastic problem for a shell of revolution of arbitrary shape. V.V.Kuz'min.
Sov. Aeronaut. (USA), vol.25, no.2, p.71-5 (1982). Translation of: *Izv. VUZ Aviats. Tekh. (USSR)*, vol.25, no.2, p.62-5 (1982).
The author examines a thin elastic shell with axis of revolution z, subject to a steady-state temperature field. (3 refs.)

101064 Three-dimensional thermoelastic treatment in a spherical region and its application to a solid sphere and a rotating heat source. Y.Tanigawa, Y.Takeuti (Dept. of Architectural Engng., Kinki Univ., Osaka, Japan).
Z. Angew. Math. & Mech. (Germany), vol.63, no.7, p.317-24 (1983).
Discusses the three-dimensional thermoelastic treatment governed by a spherical coordinate system. The first part is devoted to deriving the convenient expressions for the displacements and stress components by introducing two functions obtained from the three-dimensional field equations of motion. It is shown that one of them is harmonic, and the other one is a solution of Poisson's equation. In the latter part, the authors have applied the above treatment to a practical three-dimensional thermoelastic problem. As an illustrative example, they have analyzed the thermal stress problem of a solid sphere due to rotating heat source, and carried out the numerical calculation. (3 refs.)

46.30J Viscoelasticity, plasticity, viscoplasticity, creep, and stress relaxation

(inc. rheology of solids)

101065 A remark on the definition of hardening, softening and perfectly plastic behaviour. J.Casey (Univ. of Houston, Houston, TX, USA), P.M.Naghdi.
Acta Mech. (Austria), vol.48, no.1-2, p.91-4 (1983).
Previously, the authors adopted as primary the loading criteria of the strain space formulation of plasticity and derived associated loading conditions in stress space. This led to a definition for three distinct types of material response, namely hardening, softening, and perfectly plastic behaviour. A condition of loading from an elastic-plastic state was presupposed. The purpose of the present work is to provide an alternative definition which removes this restriction. The new definition implies the previous definition during loading from an elastic-plastic state. The main advantage of the new definition is that in regions of hardening behaviour, it enables one to prove that the loading conditions of strain space and stress space imply one another. For regions of softening or perfectly plastic behaviour, no such equivalence can be established. (3 refs.)

101066 A thought-experiment concerning an endochronic-type theory. A.Phillips, W.-Y.Lu (Yale Univ., New Haven, CT, USA).
Acta Mech. (Austria), vol.48, no.1-2, p.103-10 (1983).
The authors consider small uniaxial deformations of a rate-independent material. The strain is denoted by ϵ and the length of the strain path by l so that $dl=|d\epsilon|$. In the undeformed state $l=0$ and the final value of l is denoted by L. The deformation to be considered starts at $\epsilon=0$, increases monotonically to ϵ_1, then decreases monotonically to ϵ_2, then increases monotonically to ϵ_3, and so on, until the final reversal takes place at $\epsilon=\epsilon_\mu$. The final value of ϵ is E. In a one-dimensional endochronic type theory the stress σ can be expressed by the constitutive equation $\sigma=\int_0^L f(L,l)(d\epsilon/dl)dl$. It is shown on the basis of a thought-experiment for a material following a specific σ-ϵ curve that this equation is not always valid. (1 ref.)

101067 On the fading memory. D.Graffi.
Appl. Anal. (GB), vol.15, no.1-4, p.295-311 (1983).
The author applies the principle of fading memory to viscoelastic homogeneous isotropic unidimensional bodies. It is shown that the principle is necessary to avoid physical paradoxes, and further restrictions to the memory functions are derived. (15 refs.)

101068 On the linear theory of thermo-viscoelastic materials with internal state variables. S.Chirita (Univ. of Iasi, Iasi, Rumania).
Arch. Mech. (Poland), vol.34, no.4, p.455-64 (1982).
The author establishes the basic equations for the linear theory of thermo-viscoelastic materials with internal state variables. The author further proves a uniqueness theorem for the solution of initial-boundary value problems formulated in the context of this theory. (13 refs.)

101069 The asymptotic rest property for materials with memory. K.Frischmuth, W.Kosinski (Inst. of Fundamental Technol. Res., Polish Acad. of Sci., Warsaw, Poland).
Arch. Mech. (Poland), vol.34, no.4, p.515-21 (1982).
In order to model viscoplasticity the Coleman-Mizel theory (1968) of materials with memory is modified by rejecting its two assumptions which

introduced the fading character of the memory, namely the separability of the history space and the relaxation property of the norm. Remaining within the framework of the new Noll's theory of materials (1972), the so-called asymptotic rest property (AR) is introduced, which ensures Noll's relaxation axiom. Unfortunately this property imposes the same restrictions as the previous one. From the theorem proved in the paper one infers that absolute memory is always fading and a viscoplastic memory is by no means absolute. (7 refs.)

101070 Application of dynamical system methods to flow processes of dissipative solids. P.Perzyna (Inst. of Fundamental Technol. Res., Polish Acad. of Sci., Warsaw, Poland).
Arch. Mech. (Poland), vol.34, no.4, p.523-39 (1982).
The purpose of the paper is to apply dynamical system methods to the investigation of stability of a flow process of dissipative solids. The material of a body is described within the framework of the modified material structure with internal state variables. The internal imperfections are also taken into consideration. To describe the effects of transport phenomena (kinetics of imperfections) the evolution equations for the internal state variables are postulated in the form of partial differential equations. An isothermal flow process of dissipative solids with internal imperfections is described. The criteria of discontinuous solution and bifurcation are discussed. The problem of stability of an equilibrium intrinsic state is also investigated. The first and second Liapounov methods are used. The particular forms of the Liapounov function are assumed. It has been proved that the criteria of asymptotic stability of an equilibrium intrinsic state are stronger than those required by the thermodynamic inequality. (20 refs.)

101071 Research on rheological models for solid polymers under large impact velocity. Identification problems. J.Pouyet, J.L.Lataillade, C.Signoret (Lab. de Mecanique Phys-ERA, Talence, France).
Cah. Groupe Fr. Rheol. (France), vol.5, no.6, p.293-304 (Feb. 1982). In French. [received: July 1983]
The authors deal with results concerning the rheological behaviour of solid polymers at impact rate loadings, obtained through Hopkinson bar apparatus. The modellization is achieved by two means: the first one is based on the analog method, for which the elementary cell is a Bingham one; the elastoviscoplastic analysis is then made in a graphical way: it allows one to get the elastic, viscous and plastic parameters of the material. The second one is based on a Frechet expansion of Volterra integrals up to the third rank in order to involve nonlinear effects as well as memory ones occurring before the viscoplastic yielding. A numerical method is presented which permits one to compute the Volterra kernels related to the material. (20 refs.)

101072 Definition and applications of a behavioural law with hereditary form. P.Guelin, J.M.Terriez, B.Wack (Inst. de Mecanique de Grenoble, Grenoble, France).
Cah. Groupe Fr. Rheol. (France), vol.5, no.6, p.317-38 (Feb. 1982). In French. [received: July 1983]
A thermomechanical pattern previously defined is briefly recalled. This scheme is of hereditary form and demands the use of the discrete memory concept. In order to illustrate the descriptive possibilities of the pattern, some results are given, which have been obtained with solids exhibiting hysteresis and hardening. (45 refs.)

101073 The use of NONSAP to compare the Von Mises and a modified Von Mises yield criteria. T.R.Rogge (Dept. of Engng. Sci. & Mech., Iowa State Univ., Ames, IA, USA), C.F.Sieck.
Comput. & Struct. (GB), vol.17, no.5-6, p.705-10 (1983). (Proceedings of the 4th ADINA Conference, Cambridge, MA, USA, 15-17 June 1983).
The NONSAP finite element code was modified to include a modified Von Mises yield criterion. The program was then used to study the differences which exist between a Von Mises and a modified von Mises yield criterion for problems of elastic-plastic deformation. The particular examples used to study this variation were that of a circular hole in a plate under uniaxial tension, a pressurized hemispherical head, and a pressurized open ended cylinder. The results of the finite element analysis are compared to previously published experimental studies. (7 refs.)

101074 Calculation of turbine rotors in secondary creep range. H.A.Ziebarth (Kraftwerk Union AG, Muelheim-Ruhr, Germany).
Comput. & Struct. (GB), vol.17, no.5-6, p.809-18 (1983). (Proceedings of the 4th ADINA Conference, Cambridge, MA, USA, 15-17 June 1983).
Turbine rotors in power plants are exposed to triaxial stresses by centrifugal forces at high temperatures which induce long time creep effects. The author has implemented an algorithm for centrifugal volume forces in ADINA. He tested the numerical behaviour of the modified Newton-algorithm in ADINA within the long time secondary creep range for simplified examples. Isotropic strain hardening was assumed in most cases of creep calculations. The estimate of creep properties is based on the minimum least square method. The numerical stability in creep calculations is dependent on the magnitude of time step size and on a good fit between creep law properties and the real experimental material data. In the examples of turbine rotor models with rotational symmetry we were able to estimate the state of stress and strain under creep conditions for life time periods up to 2×10^5 hr. (10 refs.)

101075 Large strain solutions of rubber components. B.Haggblad, J.A.Sundberg (ASEA AB, Vasteras, Sweden).
Comput. & Struct. (GB), vol.17, no.5-6, p.835-43 (1983). (Proceedings of the 4th ADINA Conference, Cambridge, MA, USA, 15-17 June 1983).
A Mooney-Rivlin material model for plane strain and axisymmetric analyses of rubber has been implemented in the ADINA computer code. The code has been used in the practical design of a highly strained rubber diaphragm in a sheet metal forming press. The pressure load was kept perpendicular to deformed surfaces and the growth of contact areas between rubber and metal boundaries during the forming process was simulated by introducing successive constraints in repeated restart runs. (15 refs.)

101076 Operator split methods for the numerical solution of the elastoplastic dynamic problem. M.Ortiz, P.M.Pinsky, R.L.Taylor (Dept. of Civil Engng., Univ. of California, Berkeley, CA, USA).
Comput. Methods Appl. Mech. & Eng. (Netherlands), vol.39, no.2, p.137-57 (Aug. 1983).
The elastoplastic dynamic problem is first formulated in a form that facilitates the application of product formula techniques. The additive decomposition of the dynamic equations into elastic and plastic parts is taken as a basis for the definition of product algorithms that exploit such decomposition. In the context of a finite element discretization, these product algorithms entail, for every time step, the solution of an elastic problem followed by the application of plastic algorithms that operate on the stresses and internal variables at the integration points and bring in the plastic constitutive relations. Suitable plastic algorithms are discussed for the cases of perfect and hardening palsticity and viscoplasticity. The proposed formalism does not depend on any notion of smoothness of the yield surface and is applicable to arbitrary convex elastic regions with or without corners. The stability properties of the product algorithm are identical to those of the elastic algorithm used whereas the computational expense is practically equal to that of an elastic probelm. (26 refs.)

101077 On the dissipation postulate for discrete and continuum plastic systems. V.I.Levitas.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.6, p.25-31 (1983). In Ukrainian.
A new method is proposed for the derivation of controlling ratios for discrete and continuous elastoplastic systems and for systems with dry friction. The method requires that laws of classical mechanics (or thermodynamics) be applied to the system together with the dissipation postulate formulated by the author. A physical interpretation of the dissipation postulate is suggested and advantages of the approach proposed are discussed and compared with known methods. (13 refs.)

101078 A boundary element solution to elasto-plastic torsion of solids of revolution. Chen Zhen Sheng (Zhengzhou Res. Inst. of Mech. Engng., Zhengzhou, China).
Int. J. Numer. Methods Eng. (GB), vol.19, no.8, p.1193-207 (Aug. 1983).
A boundary element method for the solution of problems of elastic and elasto-plastic torsion of solids of revolution is proposed. The displacement and stress field produced by a circumferential ring load in an infinite elastic body are derived and used at the fundamental solution to establish the governing integral equations. For the elasto-plastic case, linear boundary elements and bilinear quadrilateral internal cells are used for discretization of these equations. In order to carry out Gaussian integrations along boundary elements and over internal cells, a method ensuring sufficient accuracy for the calculation of singular integrals is proposed. Numerical results for several problems are given. (9 refs.)

101079 On one case of the reduction of the problem of non-linear thermo-viscous-elasticity to the problem of non-linear viscous-elasticity. L.Kh.Talybly.
Izv. Akad. Nauk Az. SSR Ser. Fiz.-Tekh. & Mat. Nauk (USSR), no.6, p.33-7 (1982). In Russian.
The equations of state of non-linear viscous-elasticity of a medium taking into account the general image of the influence of the temperature on the mechanical properties of materials are changed over the mathematical prime and are more convenient for application to the solutions of problems of relations. It is proved that the theorem is reduced in the case a nonstationary homogeneous temperature field of a problem of non-linear thermo-viscous-elasticity to the problem of non-linear viscous-elasticity without the influence of temperature. (10 refs.)

101080 Elastoplastic analysis of corner region of slit under compressive stress. Z.Jin (Min. of Building Materials Industry of China, China), T.Yokobori, T.Yokobori, H.Nishi, I.Maekawa.
J. Soc. Mater. Sci. Jpn. (Japan), vol.32, no.356, p.509-15 (May 1983). In Japanese.
Elastoplastic analysis was carried out for the corner region of a slit under compressive stress. From this analysis the ratio of work hardening coefficient H' to elastic modulus E plays an important role in the transition from the elastic stress field to the plastic stress field. The aspect ratio d/a of a slit under the elastoplastic condition affects little the stress concentration at the slit corner. But stress apart from the corner decreases rapidly when the aspect ratio decreases. (22 refs.)

101081 A model of thermo-mechanical behaviour of metals with phase changes. J.Giusti (Inst. de Recherches de la Siderurgie Francaise, Saint-Germain en Laye, France), D.Radenkovic.
Mech. Res. Commun. (GB), vol.10, no.3, p.163-9 (May-June 1983).
Presents a complete model of thermo-mechanical behaviour of metals taking into account temperature dependent elasto-plastic deformation, dilatations due to phase changes and phase transformation plasticity. The model is based on the thermodynamics of irreversible processes, the state being defined by a finite number of external and internal variables. The approach is simplified as far as possible in order to achieve a realistic description and yet to obtain a model fit for engineering analyses. The authors consider, in accordance with physical observations, that only one type of phase change at a time occurs in a given process; successive transformations can be dealt with separately. (14 refs.)

101082 Solution of the dynamical problem of viscoelastic shells. L.P.Lebedev (Sci.-Res. Inst. of Mech. & Appl. Math., State Univ., Rostov-on-Don, USSR).
Sov. Phys.-Dokl. (USA), vol.27, no.11, p.986-7 (Nov. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.1-3, p.62-4 (Nov. 1982).
The behavior of viscoelastic shells is usually investigated in the quasistatic formulation (problem Q). The parameter ρ characterizing the inertia of a shell in dimensionless variables is very small for many materials. The dynamic problem (problem D) belongs to the class of problems having a small parameter associated with the leading derivative. Consequently, the inertia cannot always be neglected. The author derives sufficient conditions for asymptotic closeness of the solutions of the dynamic and quasistatic problems in any finite interval of time as $\rho\rightarrow0$. He also clarifies the significance of these conditions. (4 refs.)

101083 Solutions to the equations of one-dimensional viscoelasticity in BV. J.U.Kim (Lefschetz Center for Dynamical Systems, Brown Univ., Providence, RI, USA).
SIAM J. Math. Anal. (USA), vol.14, no.4, p.684-95 (July 1983).
The initial value problem associated with the equations of one-dimensional viscoelasticity of the rate type is studied. The system of equations is linearized and the solutions to the resulting linear system are completely analyzed in the L^1-setting by the method of Fourier transform. This enables one to establish the global existence of solutions to the original nonlinear system with small initial data in $L^1\cap$BV. As a by-product, one also obtains precise results on asymptotic behavior of solutions. (6 refs.)

101084 Subcritical stress state in a half-space with a fastened spherical cavity. S.B.Lobovik (Inst. of Math., Acad. of Sci., Ukrainian, SSR).
Strength Mater. (USA), vol.14, no.7, p.861-4 (July 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.7, p.5-7 (July 1982).
It is assumed that a subcritical stress state arises in a half-space with a spherical cavity only under the influence of the force of gravity p. The stress tensor components for the subcritical state in the region about a fastened spherical cavity under the influence of uniform cubic compression are determined from a geometrically linear theory which, with regard to its terminology, corresponds to the second variant of the theory of small subcritical strains. A postulate from rock mechanics is also used. For large depths, the problem of determining the stress-strain state of a half-space with a spherical, symmetrically loaded cavity is equivalent to the problem of determining the stress-strain state of weightless half-space with a spherical cavity under the condition that forces equal to the stresses at a depth h in a body without a cavity are applied at infinity. (5 refs.)

101085 Mazing expanded principle in viscoplasticity theory. Yu.I.Kadashevich, V.S.Kleev (Leningrad Technol. Inst. of Cellulose-Paper Industry, Leningrad, USSR).
Strength Mater. (USA), vol.14, no.7, p.913-14 (July 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.7, p.50-1 (July 1982).
It is demonstrated that the Mazing expanded principle formulated by Kul'chikhin et al. (see Probl. Prochn., no.11, p.46-8, 1979) for viscoplastic materials proceeds from the generalized theory of hardening (see Dokl. Akad. Nauk. SSSR, vol.254, no.5, p.1096-8, 1980). (7 refs.)

101086 Stability of plastic tension. G.D.Del', S.S.Oding (Voronezh Polytech. Inst., Voronezh, USSR).
Sov. Appl. Mech. (USA), vol.18, no.11, p.1023-8 (Nov. 1982). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.11, p.86-91 (Nov. 1982).
The authors investigate the plastic tension of a body with a given law for the change in length. The buckling process, which is manifest in the form of neck formation, can be represented in this case as a continuous process of equilibrium mode change. Hence, the critical deformation at which a neck is generated can be determined by the bifurcation method. Since the strain buckling under investigation occurs for developed plastic strains and material unloading does not occur in the initial stage of neck development, the authors neglect elastic strains and take the model of a rigidly plastic material with isotropic hardening. (6 refs.)

101087 Study of high-rate deformation in hole flanging. A.G.Pashkevich, A.V.Orekhov, N.Yu.Karataeva.
Sov. Aeronaut. (USA), vol.25, no.2, p.96-101 (1982). Translation of: *Izv. VUZ Aviats. Tekh. (USSR)*, vol.25, no.2, p.79-84 (1982).
The problem of studying high-rate flanging deformation conditions is posed in connection with attempts to realize the process under superplasticity conditions. Utilization of the superplasticity effect significantly broadens the technological capabilities of the process, permitting the achievement of extremely large degrees of deformation. For example, values of the light flanging factor K_{fl}=0.1-0.06 have been achieved on the MA8 alloy which corresponds to 900% maximal hole edge relative elongation. The problem is solved under certain basic assumptions. (1 ref.)

101088 Study of regularities of viscoelastic behaviour of heat-resistant polymers in creep conditions. R.B.Banyavichyus, A.I.Barauskas, A.V.Ambrazyavichyus, A.A.Askadskii.
Vysokomol. Soedin. Ser. A (USSR), vol.25, no.7, p.1436-43 (July 1983). In Russian. English translation in: *Polym. Sci. USSR (GB)*
The viscoelastic behaviour of bulk heat-resistant polymers in isothermal creep conditions has been studied for polybenzoxazol. The position of temperature transitions dividing the region of the glassy state on parts with different rates of relaxational processes was found. The regions of linear and non-linear viscoelastic behaviour were determined. The fields of mechanical serviceability of bulk heat-resistant polymer in conditions of creep and stress relaxation were comparatively analysed. (9 refs.)

101089 A twelfth order theory of transverse bending of transversely isotropic plates. E.Reissner (Univ. of California, San Diego, La Jolla, CA, USA).
Z. Angew. Math. & Mech. (Germany), vol.63, no.7, p.285-9 (1983).
Motivated by the problem of the differences between stress and stress couple concentration factors for transverse bending of plates with small circular holes the author uses a variational method for the derivation of a twelfth order two-dimensional theory of transversely isotropic plates, which includes the known sixth order theory of sheardeformable plates as a special case via constitutive-coefficient specialization. It is further shown that the twelfth order system may be reduced in a nonobvious way to two simultaneous second order and two simultaneous fourth order Laplace operator equations, with this then making it possible to obtain closed form solutions for polar coordinate boundary value problems. 101090 On the analysis of creep stability and rupture. J.Walczak, J.Sieniawski (Dept. of Mech. Engng., Rzeszow Tech. Univ., Rzeszow, Poland), K.-J.Bathe.
Comput. & Struct. (GB), vol.17, no.5-6, p.783-92 (1983). (Proceedings of the 4th ADINA Conference, Cambridge, MA, USA, 15-17 June 1983).
The analysis of problems involving creep material failure and creep buckling is considered. Creep buckling analyses are presented for some columns. A finite element creep rupture analysis of a rotating disc is performed and the results are compared with other solutions. Calculations are also reported for Ti notched tensile specimens and the numerical results are compared with experimental creep investigations, in which micrographs have been taken to study the rupture mechanisms. All numerical solutions have been carried out using ADINA in which a creep-damage material law and the updated-Lagrangian-Jaumann formulation for the thermo-elastic-plastic and creep material model were implemented. (15 refs.)

101091 Surface instability of layered media at finite deformations. J.M.Chekhov.

101092 On the use of hardness tests to estimate the extent of plastic deformation. W.J.M.Steel (Britoil, Glasgow, Scotland), J.Spence.
Strain (GB), vol.19, no.3, p.111-14 (Aug. 1983).
The standard hardness test result is dependent to some extent on the surface condition of the material being assessed. In particular, since the measurement involves permanent deformation of the surface the state of stress or strain in the material will influence the result. Consequently the hardness test may be used as an indicator of prior plastic deformation. The phenomenon of buckle propagation in undersea pipelines was considered and a theoretical model of the collapse process was developed. The model predicted the extent of the developing plastic zones around the cross-section of the collapsing pipe. Hardness measurements on the cross-sections of collapsed pipe have been used to estimate the extent of the plastic zones and comparisons with the theoretical analysis are given. (5 refs.)

101093 Stability of orthotropic multilayer cylindrical shells. K.A.Abdulkhakov, S.B.Cherevatskii.
Sov. Aeronaut. (USA), vol.25, no.2, p.49-51 (1982). Translation of: *Izv. VUZ Aviats. Tekh. (USSR)*, vol.25, no.2, p.45-7 (1982).
The authors obtain the basic system of differential equations of stability of thin circular cylindrical shells in the displacements on the basis of the relations using the hypothesis of plane sections and the assumption that the normal stresses are independent of interlayer shears. The solution of this system is sought in double trigonometric series in a form satisfying the boundary conditions in the hinged-edge-support case. (6 refs.)

101094 Some peculiarities of the buckling of ribbed cylindrical shells. S.N.Kan, Yu.I.Kaplan, V.I.Ostrovitskii.
Sov. Aeronaut. (USA), vol.25, no.2, p.63-7 (1982). Translation of: *Izv. VUZ Aviats. Tekh. (USSR)*, vol.25, no.2, p.56-9 (1982).
The authors propose a simple technique for selecting the approximating functions in the energy method for solving shell stability problems. They take as the approximating expressions a linear combination of the functions corresponding to the solutions for the simpler limiting reinforcement cases. If the components of the approximating expressions satisfy the kinematic and static boundary conditions, and also the differential equation of the problem, the solution is practically exact. If the differential equation is not satisfied but the boundary conditions are satisfied the solution error is not large. To illustrate the proposed method they examine longitudinal compression of a freely supported shell, discretely stiffened by elastic stringers, and compare the calculation results with the known solutions. 46.30M Vibrations, aeroelasticity, hydroelasticity, mechanical waves, and shocks

(see also 43.40 Mechanical vibrations and shock)

101095 Free vibrations of simply supported cylindrical shells of oval cross section. V.K.Koumousis, A.E.Armenakas (Polytech. Inst. of New York, New York, NY, USA).
AIAA J. (USA), vol.21, no.7, p.1017-27 (July 1983).
A Flugge-type theory is employed in studying the dynamic characteristics of simply supported shells of oval cross section. The components of displacement are expressed in a double Fourier series of the axial and circumferential coordinates and substituted into the equations of motion. This leads to four different typical, algebraic, eigenvalue problems from which the frequencies and shapes of four types of harmonic modes are determined. These modes are either symmetric or antisymmetric with respect to the principal axes of the cross section of the shell. A comparison of the dynamic characteristics of oval cylindrical shells obtained on the basis of the Donnell, Love, Sanders, and Flugge theories is presented. It shown that the deviations in the results of these theories increase with increasing noncircularity. (17 refs.)

101096 Transverse vibrations of nonuniform rectangular orthotropic plates. J.S.Tomar, R.K.Sharma (Univ. of Roorkee, Roorkee, India), D.C.Gupta.
AIAA J. (USA), vol.21, no.7, p.1050-3 (July 1983).
Increasing use is being made of nonisotropic and nonuniform elastic plates in the design of modern missiles, space vehicles, aircraft wings, and numerous composite engineering structures. The investigation gives extensive and accurate results to study the transverse vibrations of a rectangular orthotropic plate of parabolically varying thickness. The governing differential equation of motion is obtained and solved by the Frobenius method to find the first three modes of vibration of a nonuniform rectangular orthotropic plate having different combinations of boundary conditions and for the various values of the taper parameters and length-to-breadth ratio. (4 refs.)

101097 On the propagation of a thermo-elastic plane wave in a thin infinite plate with thermal relaxation. S.G.Mondal (AKPC Mahavidyalaya, West Bengal, India), R.N.Jana.
Acta Phys. Slovaca (Czechoslovakia), vol.33, no.4, p.235-43 (1983).
The period equation corresponding to a thermo-elastic plane wave in an infinite thermo-elastic plate with thermal relaxation has been obtained when the stressfree plane faces of the plate have been thermally insulated. This equation can be split up into symmetrical parts which in their turn can be expanded when the plate is very thin. In particular, the phase velocity-dispersion relation is obtained for such a plate in the case of a symmetrical vibration. Moreover, the phase velocity has been shown graphically and also the group velocity has been obtained in a tabular form. (3 refs.)

101098 Wave propagation in nonhomogeneous almost nonlinear thin elastic rods. W.Frydrychowicz (Inst. of Mech., Univ. of Warsaw, Warsaw, Poland), M.C.Singh.
Arch. Mech. (Poland), vol.34, no.4, p.437-54 (1982).
Wave propagation in a thin nonhomogeneous almost nonlinear elastic semi-infinite rod subjected to a time-dependent velocity impact is studied. Similarity transformations are used to transform the equation of motion and the boundary condition at the impacted end and the similarity characteristic relation is applied for locating the wave front, to obtain a similarity representa-

tion in the form of a boundary value problem. A solution of the similarity representation has been obtained in the form of power series. Restrictions on the parameters of the problem and relations among them have been determined. The stress distribution in the rod is evaluated and graphically represented. (9 refs.)

101099 Effects of sinusoidal crack-face perturbations on scattering of elastic waves. R.A.Roberts, R.J.Brind, J.D.Achenbach (Dept. of Civil Engng., Tech. Inst., Northwestern Univ., Evanston, IL, USA).
J. Nondestr. Eval. (USA), vol.2, no.3-4, p.153-9 (Dec. 1981).
The scattering of a plane longitudinal wave from a two-dimensional crack, with a sinusoidal surface perturbation whose amplitude and wavelength are much smaller than the length of the crack, is investigated. The amplitude of the cylindrical body waves in the far field are calculated from a Kirchhoff approximation that utilizes the solution to the reflection from the sinusoidal surface profile of a semiinfinite solid. The results are compared to those for a flat crack, and conditions for significant differences of the amplitude as a function of the angle of observation are discussed. Characteristic changes in the scattered field produced by profiles with different amplitudes and periods are explained. (8 refs.)

101100 Frictionless unilateral constraints and inelastic shocks. J.J.Moreau (Univ. des Sci. & Technol. du Languedoc, Montpellier, France).
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.19, p.1473-6 (30 May 1983). In French.
The concept of a standard inelastic shock is introduced; this leads to a very consistent formulation for the dynamics of a system with frictionless unilateral constraints. (5 refs.)

101101 Dynamic response of stiffened plates to impulsive load. J.Michimoto, T.Hirowatari.
Bull. Fac. Eng. Hiroshima Univ. (Japan), vol.30, no.2, p.93-101 (Nov. 1982). In Japanese.
The vibration of stiffened plates is important for the dynamic strength of local ship structure, therefore many researches have been performed. In the paper, a study on the natural vibration and dynamic response of stiffened plates is carried out, in which analytical results are compared with experimental results. The results obtained from this study are as follows: (1) Complete vibration modes of stiffened plates are expressed as the sum of the vibration components of stiffened plates and panel between the stiffeners. And these analytical results have a good agreement with the experimental results. (2) The mode superposition technique can be applied to obtain the dynamic response of elastic stiffened plates to impulsive load. (3) The deflections in dynamic response are about 20-30% larger than the static deflections in the case than the frequency of impulsive load approaches to the lower natural frequencies of stiffened plates. (8 refs.)

101102 Fluid-structure interaction and ADINA. S.Zilliacus (David W. Taylor Naval Ship Res. & Dev. Center, Bethesda, MD, USA).
Comput. & Struct. (GB), vol.17, no.5-6, p.763-73 (1983). (Proceedings of the 4th ADINA Conference, Cambridge, MA, USA, 15-17 June 1983).
The theoretical basis of a fluid-structure interaction decoupling approximation for transient analysis of wave excited submerged structures is outlined. The approximation, called the Doubly Asymptotic Approximation (DAA) has been included in ADINA. Program modifications and additions are described. Results for two verification problems are given and discussed. It is concluded that the DAA augmented ADINA program gives satisfactory results. (10 refs.)

101103 An application of ADINA to the solution of fluid-structure interaction problems. J.Sundqvist (VBB AB, Stockholm, Sweden).
Comput. & Struct. (GB), vol.17, no.5-6, p.793-807 (1983). (Proceedings of the 4th ADINA Conference, Cambridge, MA, USA, 15-17 June 1983).
ADINA is employed to solve the lowest natural frequencies and corresponding mode shapes of a plate and turbine blade when submerged in water. Finite element solution parameters such as integration order of elements, mass matrix, flow around edges, and other modelling considerations are reported. The performance of the solution algorithms and comparisons with experimentally obtained results are also presented. The experience reported can be useful for the analysis of problems involving an elastic structure immersed in an acoustic fluid (exterior problems) and problems involving an acoustic fluid within elastic structures (interior problems). (16 refs.)

101104 ADINA modeling of elastoplastic shear/compression waves in tubes. J.M.Santiago, B.I.Shehata, H.L.Wisniewski (US Army Armament Res. & Dev. Command, Aberdeen Proving Ground, MD, USA).
Comput. & Struct. (GB), vol.17, no.5-6, p.911-21 (1983). (Proceedings of the 4th ADINA Conference, Cambridge, MA, USA, 15-17 June 1983).
Results are presented of calculations using the ADINA program to model the end-to-end impact of two identical thin-walled cylinders, with one cylinder initially spinning. After impact the ends remain engaged without slipping and nearly symmetric compression and shear waves propagate into each cylinder. Purely elastic response and elastic-plastic response assuming linear isotropic hardening are analyzed. The elastic response is compared with a membrane solution, and predictions of wave speeds and stress profiles for both shear and compression waves are found to generally agree. The plastic response is compared with the Clifton-Ting solution in which the hoop stress is neglected, and the relationship between the shear and compressive components in the plastic wave is found to be fairly well reproduced. The comparisons suggest that a more refined element modeling would reproduce the fine details of the stress waves more accurately. (15 refs.)

101105 High-frequency non-axisymmetric vibrations of elastic discs. V.V.Meleshko.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.5, p.34-8 (1983). In Ukrainian.
An exact solution of a three-dimensional problem of elasticity theory is assumed as a basis for studying a spectrum of natural frequencies of the elastic disc nonaxisymmetrical vibrations within a high frequency range. Specific peculiarities of the edge mode for such vibrations are studied. (7 refs.)

101106 Oscillation of a system with hysteretic in energy dissipation under random excitation. L.M.Rizhkov.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.5, p.41-4 (1983). In Ukrainian.
Hysteretic energy dissipation was studied for its effect on single-mass system oscillations under random excitation. (4 refs.)

101107 Finite element analysis of 3-ply laminated conical shell for flutter. P.J.Sunder, C.V.Ramakrishnan (Dept. of Appl. Mech., Indian Inst. of Technol., New Delhi, India), S.Sengupta.
Int. J. Numer. Methods Eng. (GB), vol.19, no.8, p.1183-92 (Aug. 1983).
The results of the finite element analysis of 3-ply laminated conical shells with light core for linear panel flutter are presented and certain advantages of such shells discussed. (8 refs.)

101108 The dispersion and attenuation of Love type surface waves in a frictionally bonded transversely isotropic elastic medium. P.C.Pal (Dept. of Phys. & Math., Indian School of Mines, Dhanbad, India).
Indian J. Pure & Appl. Math., vol.14, no.6, p.757-66 (June 1983).
By an approximate analytical approach the dispersion and attenuation of Love type surface waves in a transversely isotropic elastic layer bonded by Coulomb friction to a transversely isotropic elastic half-space are considered. It is found from the graphs that the dispersion curves are only slightly affected by a small amount of slip at the interface, but that the level of attenuation in the system increases considerably with the amplitude of motion. Furthermore, the results for the frequency dependence of the specific attenuation factor are in good agreement with the experimental data on the attenuation of Love waves in the Earth. (17 refs.)

101109 Propagation and reflection numerical solution of viscous-nonlinear elastic waves. D.G.Agalarov, V.I.Ismailov.
Izv. Akad. Nauk Az. SSR Ser. Fiz.-Tekh. & Mat. Nauk (USSR), no.4, p.55-7 (1982). In Russian.
The numerical solution of the centered wave propagation and reflection problem is considered under the transverse impulse following the viscous-nonlinearelastic thread of finite length. The variation of thread parameters in the fixing point is represented graphically. (3 refs.)

101110 On a method of solving the transverse vibrations equation of the two-layer beam. F.G.Maksudov, M.F.Mekhtiev, A.N.Ali-zade.
Izv. Akad. Nauk Az. SSR Ser. Fiz.-Tekh. & Mat. Nauk (USSR), no.5, p.3-6 (1982). In Russian.
An analytic solution of the vibrational problem for a two-layer beam hinged on the edges and subjected to cross concentrated impact is obtained. (3 refs.)

101111 The asymptotic analysis of dynamic problems of the theory of the elasticity for a cylinder of finite length. M.F.Mekhtiev.
Izv. Akad. Nauk Az. SSR Ser. Fiz.-Tekh. & Mat. Nauk (USSR), no.5, p.62-7 (1982). In Russian.
The vibration of the empty isotropic cylinder of finite dimensions under the subjected action of axially symmetric loadings is studied. The behaviour of the solutions of the three-dimensional problem of the theory of elasticity is examined. (2 refs.)

101112 The radial vibration of multilayer reinforced tubes. G.G.Aliev, M.R.Ataev.
Izv. Akad. Nauk Az. SSR Ser. Fiz.-Tekh. & Mat. Nauk (USSR), no.6, p.139-41 (1982). In Russian.
Offers a new statement of the problem of the radial vibration of multilayer reinforced tubes taking into account reduction and lateral compression of the beam, as well as the radial forces of inertia-reinforcing beams. For the given problem the condition of the existence of stable solutions is found. (5 refs.)

101113 On the disturbance produced by an impulsive shearing stress on the surface of a semi-infinite poro-elastic medium. P.C.Pal (Dept. of Phys. & Math., Indian School of Mines, Dhanbad, India).
J. Acoust. Soc. Am. (USA), vol.74, no.2, p.586-90 (Aug. 1983).
The disturbance produced by an impulsive shearing stress in a semi-infinite poro-elastic medium is studied here. Using the Laplace-Fourier transforms the expressions for the solid displacements in the interior as well as on the surface of the semi-infinite medium are obtained. The inversion of the Laplace and Fourier transforms is carried out following Cagniard's technique modified by Gakenheimer (1969). In the limiting case the results for the classical elastic case are also obtained. Last, the variation with the time of the solid displacements after the arrival of shear wave are exihibited graphically and the results for classical case are included for the sake of comparison. (12 refs.)

101114 Impedance profile inversion via the first transport equation. W.W.Symes (Dept. of Maths., Michigan State Univ., East Lansing, MI, USA).
J. Math. Anal. & Appl. (USA), vol.94, no.2, p.435-53 (July 1983).
The subject of this paper is the inverse reflection problem for a stratified elastic half-space. That is, a linear elastic medium, whose elastic properties depend only on depth from a planar free surface, is stimulated at $t=0$ by a plane wave impulsive source. The motion of a typical surface element is recorded for $0 \leq t \leq 2T$. It is shown that this surface trace determines the acoustic impedance of the medium as a function of travel time, to (travel-time) depth T. Moreover, the author gives a precise characterization of those functions which may appear as surface traces, and show uniqueness, existence, and continuous dependence of the logarithm of the impedance as a function of the surface trace in the Sobolev H^1 topology. (14 refs.)

101115 Vibration of a parallelogram membrane. H.F.Bauer (Fachbereich Luft- und Raumfahrttech., Hochschule der Bundeswehr Munchen, Neubiberg, Germany).
J. Sound & Vib. (GB), vol.89, no.1, p.17-30 (8 July 1983).
The approximate natural frequencies of oblique membranes have been determined for arbitrary skew angles and side ratios. The response of such a membrane to a forcing function is then obtained in a similar fashion. The lower natural frequencies have been presented for various side ratios of the membrane as a function of the skew angle and vice versa. With increasing skew angle they increase rapidly. For large skew angles the lower natural frequencies are mainly made up by those of the index $n=1$. This is especially valid for membranes of large side ratio. (13 refs.)

101116 Free vibration of beams with abrupt changes of cross-section. H.Sato (Dept. of Mech. Engng., Kanazawa Univ., Kanazawa, Japan).
J. Sound & Vib. (GB), vol.89, no.1, p.59-64 (8 July 1983).
Free vibration of a beam with large and abrupt changes of cross-section is studied. Applying the simple beam theory to such a beam results in a noticeable error in certain cases, because of overestimation of the bending stiffness at the discontinuity of the cross-section. For this problem a combined type transfer matrix method in which the finite element method is partially used is presented. As a numerical example the first natural frequencies of free-free square beams with a rectangular groove are calculated. The effects of the groove dimensions on the frequency are discussed and the results are compared with those obtained by the simple beam theory. The experimental results agree very well with the calculated ones. (5 refs.)

101117 A highly accurate analytical solution for free vibration analysis of simply supported right triangular plates. D.J.Gorman (Dept. of Mech. Engng., Univ. of Ottawa, Ottawa, Canada).
J. Sound & Vib. (GB), vol.89, no.1, p.107-18 (8 July 1983).
A new analytical technique is described for the free vibration analysis of simply supported right triangular plates. While it is seen that the basic mathematical approach is applicable to right triangular plates with various types of boundary conditions, the problem of the simply supported right triangular plate is resolved for illustrative purposes and eigenvalues are presented for the first four modes. The method employed is basically that of superposition. The governing differential equation is completely satisfied and by means

of a judicious choice of building blocks the boundary conditions are satisfied to any desired degree of accuracy. (6 refs.)

101118 Comments on 'The fundamental frequency of an elastic system and an improved displacement function' [and reply]. P.A.A.Laura, L.Ercoli, R.O.Grossi (Inst. of Appl. Mech., Puerto Belgrano Naval Base, Puerto Belgrano, Argentina), Chang Shangchow.

J. Sound & Vib. (GB), vol.89, no.1, p.135-40 (8 July 1983).

Laura et al. comment on Chang Shangchow's original paper (see ibid., vol.81, p.299, 1982), congratulating him on his interesting idea. The application of the procedure, which consists of using a sequence of displacement functions, each of which always contains a single amplitude parameter and which correspond to successively improved vibrational modes, should prove valuable in many important vibration problems. Unfortunately, when applying his technique to an axial shear vibrations situation he has not used the right governing partial differential equation. His conclusions regarding his numerical result are, apparently, incorrect. In reply, Chang Shangchow states that the improved displacement function approach appears to be useful in obtaining the special values of, or in deriving general formulae for, the fundamental frequency of elastic systems in situations where the governing differential equations are partial differential equations. The values of ΩR given in the original paper are accurate and consistent with the differential equation given there. However, this equation is not the right equation for the problem of interest. This fact leads to some incorrect comments on the related numerical results. (8 refs.)

101119 Frequencies of transverse vibrations of truncated conical cantilevers [and reply]. L.T.Niblett (Materials & Structures Dept., Royal Aircraft Establ., Farnborough, England).

J. Sound & Vib. (GB), vol.89, no.1, p.141-3 (8 July 1983).

In the development of a computer program for calculating the natural frequencies of cantilever and free-free beams the frequencies of truncated wedge and conical cantilevers were calculated and the results compared with the reference values given by Downs (ibid., vol.61, p.71, 1978). Niblett states that, in by far the majority of cases, frequencies agree to six significant figures, the stated accuracy of the Downs frequencies, excepting the occasional difference of unity in the least significant figure. However the differences are considerably larger for the fundamental frequencies of most of the truncated conical cantilevers and in one case the difference is greater than 1 in 1000. Niblett states that the frequencies given by Downs are in error. In reply, Downs states that the values of fundamental frequencies given by Niblett, which he has obtained by two independent methods achieving six significant figure agreement, most certainly do indicate that the corresponding values given by Downs are not correct to six significant figures. The assertion that the stated accuracy of the λ values was six significant figures, is however, not correct. (4 refs.)

101120 Propagation of a convergent spherical stress wave in an elastic visco-plastic medium. E.Wlodarczyk.

J. Tech. Phys. (Poland), vol.23, no.2, p.141-52 (1982).

To produce high pressure in a solid, use is made of, among other agents, the chemical energy contained in an explosive, the method of concentric spherical waves being the most effective. The pressure of the gaseous products of explosion acting on the surface of a spherical solid produces a stress (pressure) wave which undergoes cumulation in the course of its motion towards the centre. When the latter is reached, the wave is reflected and this gives an additional local increase in stress of the medium studied. The authors obtain a complete closed form solution for a problem involving concentric motion of an elastic-viscoplastic spherical body. (12 refs.)

101121 Eigenvalue approach to the longitudinal vibration of a circular cylinder coupled with a thermal field. N.C.Das, S.K.Bhattacharya, S.N.Das (Dept. of Math., Jadavpur Univ., Calcutta, India).

Mech. Res. Commun. (GB), vol.10, no.3, p.133-42 (May-June 1983).

The equations governing the longitudinal vibration of a circular cylinder coupled with a thermal field are presented in the form of a matrix differential equation and are solved by means of algebraic eigenvalue approach. The results are then compared with those in the literature. (14 refs.)

101122 A numerical method for the forced nonlinear vibration. Ock Hyun Kim, Byung Ho Lee (Dept. of Mech. Engng., Korea Advanced Inst. of Sci. & Technol., Seoul, Korea).

Mech. Res. Commun. (GB), vol.10, no.3, p.151-6 (May-June 1983).

When system dynamics includes nonlinearity and discontinuity, it is difficult to solve the steady state response of the system to excitation. In this case a method of numerical simulation has been normally used. The simulation method, however, suffers from the large amount of numerical computation needed, because the computation should be continued until steady state conditions are reached. Moreover, there is also the difficulty that the exact conditions at the point of discontinuity might be missed in digitization, which may lead to unreliable solutions. For this reason Veluswami used an analogue computer to derive the solutions for the problem of an impact pair (1975). The authors present a numerical method which may overcome the above difficulties. The method is based on the fundamental assumption that the steady-state response of the system is periodic. So that from this assumption a two-point boundary-value problem that the state values at any instant should be equal to those after one period is formulated and then solved by Waner's algorithm, because the algorithm is known to be efficient even for the systems when the governing equations are nonlinear and piecewise continuous. The method is demonstrated using some examples where solutions having the same period of excitation are derived. (5 refs.)

101123 Diffraction of elastic waves by a wedge with free boundaries. M.Papadopoulos (Claremont Graduate School, Claremont, CA, USA).

Proc. R. Soc. London Ser. A (GB), vol.388, no.1795, p.335-52 (8 Aug. 1983).

The scattering of elastic waves set up by a transient body force in the interior of an infinite wedge is investigated by transform methods when the wedge has free surfaces. Exact forms are found for those stress components which are required to vanish at the free surfaces, while the remaining, elastodynamic field components can be found by application of Green's identity. Two distinct forms of solution are found. The solution which applies to the case of diffraction by a convex wedge does not hold in the non-convex case; the correction needed to satisfy the edge condition in the anomalous case is associated with a mode transformation which is not present in the convex wedge. (7 refs.)

101124 High-frequency vibrations of shells. V.L.Berdichevskii, Le Khan' Chau (M.V. Lomonosov State Univ., Moscow, USSR).

Sov. Phys.-Dokl. (USA), vol.27, no.11, p.988-90 (Nov. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.1-3, p.584-9 (Nov. 1982).

The equations of the theory of elastic shells can be regarded as equations obtained from the equations of the three-dimensional theory of elasticity in the long-wave approximation $h_* = h/l \to 0$, where h is the thickness of the shell and l is a characteristic spatial scale of the variation of the stressed state of the median surface (the 'wavelength'). By their structure the equations of shell theory have physical significance only for $h/l \ll 1$. On the other hand, the formulation of boundary-value problems is associated with the behavior of the corresponding differential operator at short wavelengths ($h/l \to \infty$), so that the formulation of the theory of shells involves not only the derivation of equations in the long-wave range, but also another logically independent step—the extrapolation of those equations to short waves. It is possible to carry out either trivial extrapolations, when the system of equations derived for long waves is considered for short waves without any changes, or nontrivial extrapolations, when terms that are small in the long-wave range but appreciable for short waves are introduced into the system of equations. (11 refs.)

101125 Condition of resonance with vibrations of cyclic symmetrical systems. N.P.Aleshin.

Strength Mater. (USA), vol.14, no.6, p.817-23 (June 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.6, p.88-93 (June 1982).

On the basis of the generalised results of special experiments, the author aims to find the necessary kinematic condition of maintaining the vibrations of elastic cyclic symmetrical systems (CSS) realised in the form of travelling or standing strain waves. (9 refs.)

101126 Factor causing vibrations of cyclically symmetric systems with traveling strain waves. N.P.Aleshin.

Strength Mater. (USA), vol.14, no.7, p.964-7 (July 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.7, p.92-4 (July 1982).

The nondisappearing wave form of the circular contact belt, maintained by compressive forces, corrects the motion of elements of the same type in case there is some asymmetry between them, i.e. it controls the sequence of motions of the same type executed by the elements. In this case the elements vibrate with the same mean frequency, whereby some of them vibrate freely while the rest carry out forced vibrations. This explains the scatter of stresses in elements of the same type which (when isolated from the system) have different natural vibration frequencies. Asymmetry of the system leads to some nonuniformity of the motion of the waves along the circumference. However, this does not prevent impulses of an external force with a certain periodicity to be matched with compatible branches of the waves, and thus they can maintain vibrations with traveling strain waves. When the asymmetry of the system increases continuously, the resistance to the forced shift of the elements increases, and therefore at some instant the strain waves of the contact belt assume a fully determinate stable position on the circumference, and the motions of the elements of the same type ceases to be interrelated. (7 refs.)

101127 One approach to numerical analysis of free vibrations of thin-walled structures. Ya.M.Grigorenko, E.I.Bespalova, A.B.Kitaigordskii, A.I.Shinkar (Inst. of Mech., Acad. of Sci., Kiev, Ukrainian SSR).

Sov. Appl. Mech. (USA), vol.18, no.11, p.986-93 (Nov. 1982). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.11, p.40-8 (Nov. 1982).

The authors represent a generalized approach to numerical analysis of free vibrations of thin elastic shells having intricate geometrical shapes, for determination of the vibration modes and frequencies. Stratification and nonhomogeneity of the material as well as variability of the inertial properties of a shell are taken into account, as is the possibility of a shell operating over a wide range of variation of its physicomechanical characteristics. (12 refs.)

101128 Numerical analysis of wave processes in a shell-rod system. V.I.Patsyuk, G.A.Rybakova, P.F.Sabodash (Odessa Technol. Inst. of Food Industry, Odessa, USSR).

Sov. Appl. Mech. (USA), vol.18, no.11, p.1000-5 (Nov. 1982). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.11, p.57-64 (Nov. 1982).

Proposes an efficient approach to the construction of explicit difference schemes for determining the unsteady reaction of a combined elastic shell-rod system which has a number of specific features: a stepwise variation of the wall thickness, a system of rod-waveguides parallel to the axis of the system with lumped masses rigidly attached to their ends etc. The mathematical model of the process is the hyperbolic system of Timoshenko equations for a shell, supplemented by wave equations for thin elastic rods. The laws of evolution of spatial profiles of radial displacements of points of the middle surface of the shell are investigated for the application of a continuous load to one end; the time development of the vibration process (accelerations) is studied at characteristic points on the side wall of the shell. 101129 Photoelastic determination of complex stress intensity factors for slant cracks under biaxial loading with higher-order term effects. P.S.Theocaris, C.P.Spyropoulos (Nat. Tech. Univ. of Athens, Athens, Greece).

Acta Mech. (Austria), vol.48, no.1-2, p.57-70 (1983).

The problem of a thin sheet containing a slant crack and subjected to a biaxial load is examined by giving the expressions for stresses in a series form, which are equally valid near and far ($r<2a$) from the crack tip. The progressive importance of the higher-order terms in the series representation for stresses, which were added to the singular and constant ones was demonstrated by giving the isochromatic fringe patterns near and far the crack-tip area. Based on these expressions, a photoelastic determination of the exact values of the complex stress intensity factor was given without necessitating appropriate correction factors and diagrams. The values of SIFs thus determined are valid independently of the polar angle and distance of measurements from the crack tip. (21 refs.)

101130 Diffraction of SH waves by a moving crack. B.M.Singh, R.S.Dhaliwal (Univ. of Calgary, Calgary, Alberta, Canada), J.Vrbik.

Acta Mech. (Austria), vol.48, no.1-2, p.71-9 (1983).

The problem of diffraction of anti-plane shear waves by a running crack of finite length is investigated analytically. The Fourier transform method is used to solve the mixed boundary value problem which reduces to two pairs of dual integral equations. These dual integral equations are further reduced to a pair of Fredholm integral equations of the second kind. The iterative solution of the integral equations has been obtained for small wave number. The solution is used to calculate the dynamic stress intensity factor at the edge of the crack. (6 refs.)

101131 Determination and simulation of stable crack growth in ADINA. D.Siegele, W.Schmitt (Fraunhofer-Inst. fur Werkstoffmech., Freiburg, Germany).
Comput. & Struct. (GB), vol.17, no.5-6, p.697-703 (1983). (Proceedings of the 4th ADINA Conference, Cambridge, MA, USA, 15-17 June 1983).
Stable crack growth was simulated by displacing and releasing the crack-tip nodes corresponding to the *J*-resistance curve or a discretionary measured displacement as a function of the crack elongation Δa. For the numerical determination of *J*-integral, use is made both of the line integral and of the method of virtual crack elongation. The computer simulation of fracture mechanics experiments using two-dimensional models produced a satisfactory measure of agreement. (20 refs.)

101132 Three-dimensional *J*-integral calculations of part-through surface crack problems. T.Murakami, T.Sato (Toshiba Corp., Yokohama, Japan).
Comput. & Struct. (GB), vol.17, no.5-6, p.731-6 (1983). (Proceedings of the 4th ADINA Conference, Cambridge, MA, USA, 15-17 June 1983).
In the field of nonlinear fracture mechanics, the *J*-integral is well known to play a significant role in predicting crack propagation and fracture strength. The authors develop the three-dimensional form of the *J*-integral using Eshelby's energy momentum tensor on any closed surface surrounding a crack front. Twenty-node isoparametric hexahedra elements in ADINA are used to calculate stress and strain distributions and Gaussian surface integration is used to evaluate *J*-integral values. Using the above method, the stress intensity factors are calculated for part-through surface cracks and the accuracy of these results is verified. (9 refs.)

101133 Simplified analysis of plastic and stable crack growth. S.Sakata, T.Shimizu, K.Hasegawa, S.Shida (Mech. Engng. Res. Lab., Hitachi Ltd., Tokyo, Japan).
Comput. & Struct. (GB), vol.17, no.5-6, p.757-62 (1983). (Proceedings of the 4th ADINA Conference, Cambridge, MA, USA, 15-17 June 1983).
A simplified analysis model for the initiation of stable growth and the propagation of a surface crack is proposed. Surface crack growth behaviour can be analyzed by two-dimensional finite element analysis using the simplified model. This model is applied for the estimation of the penetration load on Type 304 stainless steel plate with a part-through notch. (6 refs.)

101134 Fracture mechanics *J*-integral calculations in thermo-elasto-plasticity. H.M.Zien (Babcock & Wilcox Co., Alliance, OH, USA).
Comput. & Struct. (GB), vol.17, no.5-6, p.775-81 (1983). (Proceedings of the 4th ADINA Conference, Cambridge, MA, USA, 15-17 June 1983).
A finite element post-processor has been developed to calculate an incremental plasticity-based *J*-integral for fracture mechanics evaluations. The post-processor accounts for elastic-plastic deformations and thermal strains. The ADINA finite element computer program, with minor modifications by Babcock and Wilcox, was used with the Ramberg-Osgood stress-strain law and provides through its 'porthole' files the required results of stresses, strains, displacements, and elastic and plastic strain energies. The numerical results of the post-processor indicate that the thermal *J*-integral, which consists of a line integral for the isothermal case and an additional area integral for the thermal effect, can be considered path-independent even in the presence of plastic and thermal strains. (12 refs.)

101135 ADINA analysis of large deflections and stresses in bending fatigue specimens. J.-O.Nilsson (Steel Div. Res. & Dev. Centre, Sandviken, Sweden), M.Hehenberger.
Comput. & Struct. (GB), vol.17, no.5-6, p.865-70 (1983). (Proceedings of the 4th ADINA Conference, Cambridge, MA, USA, 15-17 June 1983).
Laboratory tests of flapper valve steel bending fatigue specimens are compared to large deflection ADINA analyses based on the nine-node shell element. Three standard thicknesses, 0.254 mm, 0.381 mm and 0.508 mm, are investigated. Both the longitudinal and the anticlastic curvatures could be brought into good agreement with experiment through proper modelling of the grip section by bakelite brick elements in sandwich form. The calculated stress maxima are observed in the specimen edge region. This result is consistent with observations that fracture initiation usually occurs in that region. (10 refs.)

101136 Analysis of surface cracks in plates and shells using the line-spring model and ADINA. M.D.German, V.Kumar, H.G.deLorenzi (Corporate Res. & Dev., General Electric Co., Schenectady, NY, USA).
Comput. & Struct. (GB), vol.17, no.5-6, p.881-90 (1983). (Proceedings of the 4th ADINA Conference, Cambridge, MA, USA, 15-17 June 1983).
The line-spring model of Rice and Levy (1972) is used in conjunction with thin shell finite elements to analyze surface cracks in plates and cylindrical shells. Implementation of the approach in the finite element code ADINA is discussed in detail. Both linear and nonlinear cases are considered. The stress intensity factor and the *J*-integral results are obtained for several example problems concerning surface cracked plates and axial and circumferential flaws in cylinders. Comparisons are made with previous work. Sensitivity of the results relative to the mesh size, integration scheme and other relevant parameters is also investigated. (27 refs.)

101137 Application of the finite method in micromechanical analyses of creep fracture problems. C.W.Lau, A.S.Argon, F.A.McClintock (Dept. of Mech. Engng., MIT, Cambridge, MA, USA).
Comput. & Struct. (GB), vol.17, no.5-6, p.923-31 (1983). (Proceedings of the 4th ADINA Conference, Cambridge, MA, USA, 15-17 June 1983).
The finite element method is applied to determine the generalized stress intensity factors for two problems fundamental in the micromechanical study of intergranular creep fracture. Special techniques to simulate multipoint constraints arising from symmetry and periodicity, and a singularity element have been developed and proved effective. The good agreements of finite element results with local field solutions are discussed. (19 refs.)

101138 Probability distributions for the strength of composite materials. IV. Localized load-sharing with tapering. R.E.Pitt, S.L.Phoenix (Sibley School of Mech. & Aerospace Engng., Cornell Univ., Ithaca, NY, USA).
Int. J. Fract. (Netherlands), vol.22, no.4, p.243-76 (Aug. 1983).
For pt.III see ibid., vol.20, p.291, (1982). Continues the study of the chain-of-bundles model for the statistical strength of composite materials by focusing carefully on the localized load redistribution in two-dimensional composites. A tapered load-sharing rule is considered which distributes the nominal load of a failed fiber among its four nearest neighbors, with the two adjacent fibers taking a greater proportion of the load. The authors consider three distinct probabilistic techniques of analysis and find that the basic probability structure for the distribution for composite strength turns out to be the same as for the idealized local load-sharing in earlier work; however, the median strength of the composite rises moderately due to the milder overloads on the fibers adjacent to breaks, while the presence of small overloads on more distant fibers has almost no effect on strength. Also, the variability in composite strength tends to decrease mildly, due to a slight increase in the critical fracture sequence size leading to catastrophic failure. (17 refs.)

101139 The elasticity problem for a thick-walled cylinder containing a circumferential crack. H.F.Nied, F.Erdogan (Lehigh Univ., Bethlehem, PA, USA).
Int. J. Fract. (Netherlands), vol.22, no.4, p.277-301 (Aug. 1983).
The elasticity problem for a long hollow circular cylinder containing an axisymmetric circumferential crack subjected to general nonaxisymmetric external loads is considered. The problem is formulated in terms of a system of singular integral equations with the Fourier coefficients of the derivative of the crack surface displacement as density functions. The stress intensity factors and the crack opening displacement are calculated for a cylinder under uniform tension, bending by end couples, and self-equilibrating residual stresses. (19 refs.)

101140 Analysis of cracks with multiple branches. W.K.Wilson (Res. & Dev. Center, Westinghouse Electric Corp., Pittsburgh, PA, USA), J.Cherepko.
Int. J. Fract. (Netherlands), vol.22, no.4, p.303-15 (Aug. 1983).
Solutions for crack tip stress intensity factors were determined by the finite element method for a wide range of branch crack configurations. In the analysis it is assumed that the length of each branch is much smaller than the length of the main crack. For a large majority of the cases analyzed, the branch region was subject to a mode I stress state (K_I). In the remaining cases a uniform stress field acting parallel to the main crack was imposed. For conditions where previous solutions were available a comparison was made. (9 refs.)

101141 Thermal stresses in an orthotropic elastic half-plane weakened by a Griffith crack. D.K.Ram (Dept. of Math., DAV Coll., Koraput, India), H.K.Parhi.
J. Math. & Phys. Sci. (India), vol.17, no.1, p.1-19 (Feb. 1983). [received: Aug. 1983]
The thermal stresses and displacements in an orthotropic semi-infinite elastic medium containing a Griffith crack are investigated. The crack is situated parallel to the free boundary at a finite distance. The plane of the crack thus divides the semi-infinite space into two domains, on one side of it is the infinite space and on the other side is a slab of finite thickness. The free edge is assumed to be at zero temperature, free from surface traction and the heat flux is prescribed on the crack surface. Also it has been assumed that the temperature, displacements, and stresses vanish at infinity and thermal conditions on the upper surface of the crack are identical with those on the lower surface. (7 refs.)

101142 Infinite row of parallel cracks in an orthotropic strip. B.Behera, A.K.Das (Dept. of Math., Regional Engng. Coll., Rourkela, Orissa, India).
J. Math. & Phys. Sci. (India), vol.17, no.1, p.51-62 (Feb. 1983). [received: Aug. 1983]
The problem of an infinite row of parallel cracks, situated symmetrically in an orthotropic strip, perpendicular to the edges has been analysed under the assumption of plain strain. Two types of boundary conditions on the side edges of the strip are considered: (1) the edges are confined between two fixed smooth rigid planes; and (2) the edges are free from stresses. The mixed boundary conditions lead to dual integral equations which are reduced to Fredholm integral equations of the second kind and the same is solved by the Fox and Goodwin method. In order to show the effect of orthotropy, a numerical study for the stress intensity factor is carried out taking the values of a fibre-reinforced composite material and some isotropic materials. (10 refs.)

101143 Elastic-plastic finite-element analysis of cracked plate under biaxial stress and its application to fatigue crack propagation. T.Hoshide (Dept. of Engng. Sci., Kyoto Univ., Kyoto, Japan), A.Yamada, K.Tanaka.
J. Soc. Mater. Sci. Jpn. (Japan), vol.32, no.356, p.528-34 (May 1983). In Japanese.
The elastic-plastic deformation of a square plate with a center crack under biaxial stresses was analysed by the finite element method of plane stress. The loading conditions analysed were equibiaxial, uniaxial and shear. The values of the crack-tip opening displacement and J integral increased as the stress parallel to the crack changed from tension to compression, when compared at the same perpendicular stress. The increment under shear loading was considerably large, while the difference between the equi-biaxial and uniaxial cases was relatively small. The interrelation among the near-tip stress-strain distribution, the crack-tip opening displacement and J integral was confirmed to be characterized by the HRR type singularity field. A simple method to estimate J integral for a center-cracked plate under biaxial stresses was proposed based on the finite element analysis. The fatigue crack growth data obtained with a cruciform specimen under biaxial cyclic stresses were analysed in terms of J integral range by using the proposed method. (22 refs.)

101144 Predicting stress corrosion crack growth rates at high stress levels. II. The general yield situation. E.Smith (Metal. Dept., Univ. of Manchester Inst. of Sci. & Technol., Manchester, England).
Mater. Sci. & Eng. (Switzerland), vol.60, no.2, p.185-8 (Aug. 1983).
For pt.I see ibid., vol.55, p.97 (1982). On the assumption that the functional relationship between the crack tip opening angle (CTOA) and growth rate dc/dt is valid outside the LEFM regime, then by determining the CTOA at high stresses, it is in principle possible to predict the stress corrosion crack growth rate at high stresses. A specific model was analysed: that of an edge crack in a solid subjected to a sustained tensile stress such that yielding was extensive although contained; with this model, J increases as the crack propagates. It was concluded that high stress crack growth predictions based on the usual LEFM procedures will be non-conservative in cases where dJ/dc is positive. The earlier work is extended by examining a case where there is general yield and where *J* remains constant during crack propagation. In this case, crack predictions based on LEFM procedures are conservative. (5 refs.)

101145 One case of closure of a crack in a temperature field. V.D.Belen'kii (Rostov-on-Don Plant Affiliated Higher Tech. School, Rostov, USSR).
Sov. Mater. Sci. (USA), vol.18, no.5, p.418-21 (Sept.-Oct. 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.5, p.57-61 (Sept.-Oct. 1982).
In tension of an isotropic elastic plane with a straight crack the boundary of the latter changes to an ellipse. The author studies the question of closure of a crack by a temperature field acting in the plane. The problem arising of thermoelasticity is solved with use of a Fourier integral transformation. (7 refs.)

101146 Destruction of a metal ring subjected to pulsed loading. G.V.Stepanov (Inst. of Strength Problems, Acad. of Sci., Kiev, Ukrainian SSR).
Strength Mater. (USA), vol.14, no.6, p.814-17 (June 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.6, p.85-8 (June 1982).
The proneness of material to multiple fracture depends on the degree of homogeneity of its properties, and similarly to the standard mechanical characteristics of materials, it has to be determined from the results of special tests. The authors investigate the example of the destruction of a ring upon expansion the correlation between destruction and the distribution of limit strain along the circumference of the ring at the instant of destruction.

According to the calculations the distribution is not symmetric, and its experimental determination requires a large number of experiments. (4 refs.)

101147 Dynamic stress intensity factors at the ends of two collinear longitudinal shear cracks. N.M.Borodachev, V.A.Kol'tsov (Kiev Inst. of Civil Aeronautical Engrs., Kiev, Ukrainian SSR).
Strength Mater. (USA), vol.14, no.7, p.891-5 (July 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.7, p.31-4 (July 1982).
The effect is evaluated of frequency and mode of a harmonic load, the elastic characteristics of the material, and the length and location of the cracks on the stress intensity factors at the ends of two collinear longitudinal shear cracks. (5 refs.)

101148 Computer modeling of processes of fracture of notched fiber-reinforced composites. A.S.Ovchinskii, S.A.Savel'eva (A.A. Baikov Inst. of Metall., Acad. of Sci., Moscow, USSR).
Strength Mater. (USA), vol.14, no.7, p.945-51 (July 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.7, p.75-80 (July 1982).
It is shown that the processes of fracture of notched composites can be examined without the application of the concepts of linear fracture mechanics. The problem is solved by the computer modeling of the process of fracture of the composite. The method includes the examination of the distribution of stresses in the composite in the area of a notch or crack. An unidirectional fiber-reinforced composite loaded with tensile forces along the fibers and containing an edge notch is examined. The presence of the notch results in the formation of a nonuniform stress field. The distribution of the stresses in the fibers is analyzed using the model, which is uniaxial because it is required to analyze the stress distribution only along one axial coordinate. It is also a volume model since the stress distribution in both intersected fibers and in adjacent fibers is examined. (11 refs.)

101149 Mechanics of composite-material failure under axial compression (plastic failure). A.N.Guz (Inst. of Mech., Acad. of Sci., Kiev, Ukrainian SSR).
Sov. Appl. Mech. (USA), vol.18, no.11, p.970-76 (Nov. 1982). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.11, p.21-9 (Nov. 1982).
Considers the failure mechanism of monodirectional composite material with a metallic matrix under compression along the reinforcing elements, when stability loss of the reinforcing elements appears. (7 refs.)

101150 Stress state in a strip with four adjacent circular holes. Zh.S.Erzhanov, N.I.Mironenko, T.Kh.Zhetpisov (Inst. of Seismology, Acad. of Sci., Kazakh SSR).
Sov. Appl. Mech. (USA), vol.18, no.11, p.1006-9 (Nov. 1982). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.11, p.65-9 (Nov. 1982).
Considers a strip with four adjacent, pairwise identical and symmetrically situated circular holes. In order to solve the formulated problem the authors apply a method based on the successive application of Sherman's method and on the Fourier integral transform. The authors also present the numerical analysis of the stress state in the strip for four variants of the quantities characterizing the position and the dimensions of the holes and for three variants regarding its load. (3 refs.)

101151 Longevity of an aging viscoelastic body with a crack having a moderate tip zone. V.M.Pestrikov (Inst. of Mech., Acad. of Sci., Kiev, Ukrainian SSR).
Sov. Appl. Mech. (USA), vol.18, no.11, p.1028-34 (Nov. 1982). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.11, p.92-9 (Nov. 1982).
Considers the longevity of an aging viscoelastic body with a crack having a moderate degenerate plastic zone at the edges, which is modeled by the Leonov-Panasyuk-Dugdale model. The author pays special attention to determining the duration of the slow crack growth stages up to the beginning of its dynamic development. (10 refs.)

101152 Numerical-analytical method of solving dynamic contact problems. M.D.Borodai.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.5, p.25-8 (1983). In Ukrainian.
Investigates the stress-strained state of elastic domains under unstable actions. The numerical-analytical method is proposed for solution of the contact problems. (5 refs.)

101153 The longitudinal impact on the elastic frustrum of a cone. M.Kh.Ilyasov, A.B.Ibragimov.
Izv. Akad. Nauk Az. SSR Ser. Fiz.-Tekh. & Mat. Nauk (USSR), no.5, p.47-54 (1982). In Russian.
The nonstationary boundary problem of the longitudinal impact along the elastic frustrum of a cone existing in an absolute smooth rigid stirrup is investigated. The face of the cone has a spherical surface. The normal stress, or the axial displacement as a function of time and angle are given on the face. Considering the angle of opening of the cone to be equal to $\pi/2$, the authors derive solutions of corresponding problems for the plastic half-space. The authors also examine the examples, when the dependence of the outer disturbance on time is given in the form of one function of Heavisides and sinusoids and when the time-independent radial velocity is given on the face. (2 refs.)

101154 Application of the method of forces to the solution of problems of contact interaction of nodes in structures. N.S.Galkina, V.I.Grishin, A.I.Surkov.
Strength Mater. (USA), vol.14, no.6, p.800-4 (June 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.6, p.74-7 (June 1982).
Presents an effective method of solving problems of contact interaction of elastic bodies simulating the operation of real structures; the method is based on the method of forces of structural mechanics and the finite element methods in displacements. (7 refs.)

101155 Discrete interaction of a plate with a compressed-tensioned rod. L.S.Rybakov (Moscow Aviation Inst., Moscow, USSR).
Sov. Appl. Mech. (USA), vol.18, no.11, p.1018-22 (Nov. 1982). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.11, p.80-5 (Nov. 1982).
Studies a two-dimensional contact problem of the discrete interaction of an infinite thin plate with an infinite, homogeneous, compressed-tensioned rod through a periodic system of rivets under the condition that one of the rivets, having fractured, no longer performs its functions as a rigid connection betwen the plate and rod. With regard to the axial components (projections on the rod axis) of the reactive forces in the rivets, the problem reduces to an infinite system of linear algebraic equations. An exact solution of this system is constructed in quadratures using the Laurent transform. (6 refs.)

101156 On a generalization of the Zhukovskii-Chaplygin theory of hydrodynamic lubrication. A.A.Volkov.
Sov. Aeronaut. (USA), vol.25, no.2, p.18-21 (1982). Translation of: *Izv. VUZ Aviats. Tekh. (USSR)*, vol.25, no.2, p.18-21 (1982).
The author generalizes the hydrodynamic theory of lubrication for periodic oscillations of a journal in a bearing by solving the equations of fluid dynamics in stream functions in the Stokes approximation. (3 refs.)

101157 Determination of dynamic stress-intensity factors by holographic interferometry. H.P.Rossmanith (Inst. of Mech., Tech. Univ. Vienna, Vienna, Austria).
Opt. & Lasers Eng. (GB), vol.4, no.3, p.129-43 (1983).
A method is derived for the determination of the dynamic stress-intensity factor from isopachic fringe patterns around running crack tips obtained by double-exposure dynamic holographic interferometry. Interference patterns are analytically generated and compared with experimentally recorded isopachic interference patterns. Crack jump and boundary effects on the interference patterns are investigated in detail. (11 refs.)

101158 Characteristics of the failure analysis at quasi-static stress. E.Macherauch, H.Muller (Inst. fur Werkstoffkunde I, Univ. Karlsruhe, Karlsruhe, Germany).
Maschinenschaden (Germany), vol.56, no.3, p.86-98 (1983). In German.
Within the scope of elasticity theory the important engineering stress conditions are characterized by terms material stress/material resistance. The most important methods for determining them are discussed. The practical applicability of failure analysis is explained, taking into account the various failure hypotheses (extension, deformation energy, normal and shearing stress hypotheses), and documented by some experimental results. The influences causing failure and the basic types of failure are presented. In addition, the quantitative failure treatment—for determined and probabilistic cases—is discussed on the basis of safety coefficients. (17 refs.)

46.60 RHEOLOGY OF FLUIDS AND PASTES

101160 On the dynamics of films of viscous and elastoviscous liquids. V.M.Entov (Inst. for Mech. Problems, Acad. of Sci., Moscow, USSR).
Arch. Mech. (Poland), vol.34, no.4, p.395-407 (1982).
The isothermal dynamics of thin liquid film is discussed. General dynamical equations are derived. The effects of complicated rheology of the liquid are accounted for. Constitutive equations of elastoviscous liquid of Maxwellian type are discussed. Stationary motions as well as small perturbations of film about its stationary position are considered. Some examples are given including the equations of capillary waves on the plane film of viscous liquid and

the growth of a thin spherical film of the elastic liquid due to internal pressure. (18 refs.)

101161 Rheological behaviour of diluted suspensions of deformable particles in simple flow. Yu.V.Pridatchenko, Z.V.Pasichnik.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.5, p.38-41 (1983). In Ukrainian.
Investigates the rheological behaviour of diluted suspensions of deformable particles. (3 refs.)

101162 Electro-Rheology, the basis of novel activators. W.G.Miller.
Funk-Tech. (Germany), vol.38, no.6, p.249-50 (June 1983). In German.
A brief report on the research and development of efficient rheological materials by J.K. Royle of Sheffield University in cooperation with Laser Engineering Ltd. Rheological liquids contain minute particles, for instance methacrylates suspended in oil, and change their viscosity drastically when high potential gradients (typically 2-4 kV/mm) at low current densities are applied. The main existing and proposed uses are in friction control, fluid clutches and flow valves. (3 refs.) *A.L.*

101163 Shear modification of polymers. A.Rudin (Guelph-Waterloo Centre, Univ. of Waterloo, Waterloo, Ontario, Canada), H.P.Schreiber.
Polym. Eng. & Sci. (USA), vol.23, no.8, p.422-30 (mid-June 1983). (Symposium on the Rheological Properties of Polymers. 65th Chemical Conference of the Chemical Institute of Canada, Toronto, Ont. Canada, 30 May-2 June 1982).
Time dependence of recovery from shear history effects in polymer liquids can be used advantageously to modify the properties of macromolecules. The net result of shearing is a reduction in elasticity and possibly in viscosity of the polymer fluid. The material may be processed subsequently in a transient, less elastic, and less viscous state if the diffusion-related rate of recovery of a more fully entangled equilibrium state is not too rapid. Shear-induced changes in entanglement density are manifested in variations in die swell, die entrance pressure losses, normal stresses, melt strength, flow defects such as melt fracture and sharkskin surfaces, haze of extruded films, application properties of coatings liquids and, other properties. Evidence for shear-modification effects is reviewed. The polymer species that are most amenable to this treatment are identified in general terms; shear modification processes that have been used are summarized. Methods for augmenting the efficiency of mechanical shear modification include addition of plasticizers, fillers, and incompletely miscible polymers. (79 refs.)

101164 Pressure dependence of Newtonian viscosity. L.A.Utracki (Industrial Materials Res. Inst., Nat. Res. Council of Canada, Montreal, Quebec, Canada).
Polym. Eng. & Sci. (USA), vol.23, no.8, p.446-51 (mid-June 1983). (Symposium on the Rheological Properties of Polymers. 65th Chemical Conference of the Chemical Institute of Canada, Toronto, Ont. Canada, 30 May-2 June 1982).
Recently, a new method of generalization of the zero shear viscosity of liquids has been proposed. The method utilizes a modified Doolittle formula and the temperature-dependent volume, as expressed by the corresponding states theory of liquids. Furthermore, the glass-transition temperature has been employed as the scaling parameter. The proposed treatment allowed prediction of the correlation between: (i) viscosity, η, and temperature, T, (ii) η and the molecular weight of polymer, (iii) η and concentration, and (iv) the combined effect of these variables. At present, the method is extended to the pressure, P, effect. Furthermore, by substituting the free volume fraction in the Doolittle formula by the theoretical 'hole fraction', a master-relation is proposed that provides means for predicting $\eta = h(T,P)$ dependence. (40 refs.)

101165 Highly elastic-constant viscosity fluids. L.Choplin (Chem. Engng. Dept., Laval Univ., Quebec, Canada), P.J.Carreau, A.Ait Kadi.
Polym. Eng. & Sci. (USA), vol.23, no.8, p.459-64 (mid-June 1983). (Symposium on the Rheological Properties of Polymers. 65th Chemical Conference of the Chemical Institute of Canada, Toronto, Ont. Canada, 30 May-2 June 1982).
The rheological properties of three types of fluids that exhibit large normal stresses are examined and compared. These fluids have a constant or nearly constant viscosity and can be used as model viscoelastic fluids, covering a range of viscosity from 0.1 to 124 Pa.s. One lubricant, Emkarox FC 31-45000, is shown to have the characteristics of a second-order fluid. Series difficulties encountered in measuring the rheological properties of the Separan-corn syrup solutions (Boger fluids) are reported. The Emkarox and solutions of polyacrylamide (Pusher 700) in mixtures of glycerine and water are proposed as better model fluids. (13 refs.)

101166 Steady-shear rheological behavior of the suspension of spherical particles in a second-order fluid. P.N.Kaloni, V.Stastna (Dept. of Math., Univ. of Windsor, Windsor, Ontario, Canada).
Polym. Eng. & Sci. (USA), vol.23, no.8, p.465-70 (mid-June 1983). (Symposium on the Rheological Properties of Polymers. 65th Chemical Conference of the Chemical Institute of Canada, Toronto, Ont. Canada, 30 May-2 June 1982).
Studies the rheological behavior of a dilute suspension of rigid spherical particles in a second-order fluid. The results of viscous fluids are extended to discuss the expression for the bulk stress tensor of a second-order fluid and also obtain an approximate solution to the shear flow problem of this fluid. By combing these results, the authors write an approximate constitutive equation for the bulk stress tensor for such a suspension and study it in a shear flow. It is found that the new equation predicts no variation in the shear viscosity, but predicts enhancement of the pre-existing non-Newtonian nature of the suspending fluid with regard to the normal stress functions. (9 refs.)

101167 Circulation-preserving plane flows of incompressible viscous fluids. Wan-Lee Yin (School of Engng. Sci. & Mech., Georgia Inst. of Technol., Atlanta, GA, USA).
Arch. Ration. Mech. & Anal. (Germany), vol.83, no.2, p.169-84 (1983).
The method of complex variables is used systematically to investigate (generally unsteady) plane solutions of the Navier-Stokes equations. (9 refs.)

101168 The free-boundary problem for gravity-driven unidirectional viscous flows. E.O.Tuck (Appl. Math. Dept., Univ. of Adelaide, Adelaide, Australia), M.Bentwich, J.van der Hoek.
IMA J. Appl. Math. (GB), vol.30, no.2, p.191-208 (March 1983).
If a layer of viscous fluid drains steadily under gravity, while in contact with an upward-moving vertical cylinder of a general cross section with boundary C_B, its velocity $\omega(x,y)$ satisfies a Poisson equation $w_{xx}+w_{yy}=g/\nu=$constant. There are two boundaries, the given curve C_B, on which w takes a prescribed constant value, and a free boundary C_F marking the edge of the layer, whose shape the authors wish to determine. In order to do this, they need two boundary conditions on C_F; one is the zero-stress condition $\partial w/\partial n=0$, and they assume that the other is that w is constant around C_F. The latter condition is shown to be equivalent to a requirement that the volume flux in the layer is maximal. The properties of the resulting free-boundary problem are discussed, and numerical solutions obtained for some special cases. For example, a solution for the case when $_B$ is a 270° corner shows that the layer thickness at the corner is reduced to 76% of the thickness on the flat part of the boundary. The present analysis is relevant to industrial coating problems, such as edge effects in continuous galavanizing of sheet steel. (14 refs.)

101169 Flow of viscous incompressible liquid under the action of surface tension forces. K.A.Chornous.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.5, p.44-7 (1983). In Ukrainian.
Using the theory of hydrodynamic potentials the problem of viscous liquid deformation under the effect of the surface tension forces is reduced to one of solving a boundary nonlinear integro-differential equation relative to the functions which are positions of the liquid body boundary points and their rates. It is essential that the equations obtained contain no curvature and that their integral operator kernals have a comparatively simple structure. (8 refs.)

101170 Low-Reynolds-number flow past a cylindrical body. K.Tamada (Dept. of Mech. Engng., Osaka Industrial Univ., Daito, Japan), H.Miura, T.Miyagi.
J. Fluid Mech. (GB), vol.132, p.445-55 (July 1983).
Two-dimensional flow past a cylindrical body of arbitrary profile at small Reynolds numbers is studied theoretically. The asymptotic flow field at large distances from an immersed body is shown to depend only upon the force acting on the cylinder. This universal field is determined by solving the Navier-Stokes equation numerically. The result enables the authors to evaluate the force acting on the body as a function of the flow Reynolds number. A detailed calculation is made of the drag coefficients of a circular cylinder and a flat plate. Results compare favourably with existing experimental and numerical data. (19 refs.)

101171 Formation of saturated solitons in a nonlinear dispersive system with instability and dissipation. T.Kawahara (Dept. of Phys., Kyoto Univ., Kyoto, Japan).
Phys. Rev. Lett. (USA), vol.51, no.5, p.381-3 (1 Aug. 1983).
A simple one-dimensional nonlinear equation including effects of instability, dissipation, and dispersion is examined numerically. It is observed that for the strongly dispersive case the temporal evolution is characterized by formation of a row of solitary pulses of equal equilibrium amplitudes. The width of each pulse is determined by the relative importance of the growing and the damping effects. The equilibrium amplitude increases as the dispersive effect increases. (6 refs.)

101172 Remarks on the renormalization group in statistical fluid dynamics. J.-D.Fournier, U.Frisch (Obs. de Nice, Nice, France).
Phys. Rev. A (USA), vol.28, no.2, p.1000-2 (Aug. 1983).
A variant of the renormalization group is applied to the problem of randomly forced fluids studied by Forster, Nelson, and Stephen [Phys. Rev. A 16, 732 (1977)] and others. Amplitude factors (thought to be nonuniversal by some authors) are evaluated and shown to have universal values. Comparisons with closures are made. The possibility of a breakdown of self-similarity and/or universality due to intermittency effects is discussed. (18 refs.)

47.15 LAMINAR FLOWS

101173 Oscillatory flow through a sharp-edged sudden contraction of a circular tube. S.Yokota, K.Nakano, T.Yamaguchi (Tokyo Inst. of Technol., Tokyo, Japan).
Bull. Res. Lab. Precis. Mach. & Electron. (Japan), no.51, p.1-9 (March 1983).
Laminar oscillatory flow of an incompressible fluid through a sharp-edge sudden contraction of a circular tube is studied. Elucidation of the dynamic behaviors of the flow is indispensable for improving the characteristics of the hydraulic components. Numerical solutions of the oscillatory flow field are obtained by an implicit finite difference method and the axial velocity profiles of the oscillatory flow superposed on a steady flow are measured by means of a laser Doppler method. The results obtained ascertain that there is good agreement. The numerical results obtained indicate that at a Reynolds number less than 800 no flow separation occurs near the sharp-edged corner of the flow field. It is also concluded that the oscillatory velocity profiles near the entrance are not dependent on the Reynolds number and frequency, but only on the axial position. (7 refs.)

101174 Stability of Couette flow between rotating cylinders lined with porous material. I. M.N.Channabasappa, G.Ranganna, B.Rajappa (Dept. of Math., Karnataka Regional Engng. Coll., Srinivasnagar, India).
Indian J. Pure & Appl. Math., vol.14, no.6, p.741-56 (June 1983).
Deals with the linear stability analysis of laminar flow between two long concentric circular rotating cylinders with nonerodable porous lining on the outer wall of the inner cylinder. Appropriate boundary conditions have been derived taking into account the nonvanishing of the disturbance velocity components at the porous boundary. The resulting sixth order boundary value eigenvalue problem has been solved numerically for the small-gap case, assuming that the marginal state is stationary. The influence of the permeability and the thickness of the porous lining as well as the radii ratio on the critical Taylor number has been established. (10 refs.)

101175 The laminar unsteady flow of a viscous fluid away from a plane stagnation point. M.J.Hommel (Dept. of Mech. Engng., Stanford Univ., Stanford, CA, USA).
J. Fluid Mech. (GB), vol.132, p.407-16 (July 1983).
The development with time of the impulsively started laminar flow of a viscous fluid away from a stagnation point is investigated. A series expansion in time is formulated for the shear stress and displacement thickness. This series expansion is obtained from a numerical solution of the full Navier-Stokes equations, and 44 terms are computed for the shear-stress series. The series is analysed and series-improvement techniques are employed to improve its convergence properties. The final series that results converges even for infinite time, and acceptable agreement with the Proudman and Johnson calculations (1962) of shear stress for steady-state flow at a stagnation point is obtained. Only 17 terms in the displacement-thickness series are reported, owing to numerical difficulties which are considerably more of an obstacle than in the shear-stress calculation. (11 refs.)

101176 Single-and-multiple-crater induced nosetip transition. A.Todisco, B.Reeves, D.Siegelman, R.Mascola (AVCO Systems Div., Wilmington, MA, USA).
AIAA J. (USA), vol.21, no.7, p.939-40 (July 1983).
Experiments were conducted at a Mach number of 5 to assess the effect of simulated weather impact craters on nosetip boundary-layer transition. The program treated single craters and patterns of multiple elliptical craters of various depth, ellipticity, and azimuth angle. Test results confirm predictions that craters of the order of from 0.05 to 0.64 mm (2 to 25 mil) depth induce nosetip boundary-layer transition. Results obtained from backface thermocouple measurements show the influence of crater parameters on local transition Reynolds numbers, Re_k and Re_θ transition criteria for craters are compared to criteria for protuberance roughness. (3 refs.)

101177 Laminar free convection on a vertical nonisothermal plate with vigorous blowing. V.M.Eroshenko, L.I.Zaichik, V.A.Pershukov (G.M. Krzhizhanovskii Sci.-Res. Energy Inst., USSR).
J. Eng. Phys. (USA), vol.43, no.6, p.1331-4 (Dec. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.6, p.909-13 (Dec. 1982).
Asymptotic solutions are obtained for the equations of a dynamically similar boundary layer in the case of natural convection on a vertical nonisothermal plate with vigorous blowing. (6 refs.)

101178 Note on derivation of the boundary layer equations with account for blowing. V.G.Pavlov.
Sov. Aeronaut. (USA), vol.25, no.2, p.22-5 (1982). Translation of: *Izv. VUZ Aviats. Tekh. (USSR)*, vol.25, no.2, p.21-5 (1982).
The authors discuss the influence of 'weak' and 'strong' blowing on a viscous incompressible fluid flow model. (1 ref.)

101179 Numerical solution of stationary problems of viscous incompressible fluid flow. V.A.Prusov.
Sov. Aeronaut. (USA), vol.25, no.2, p.26-31 (1982). Translation of: *Izv. VUZ Aviats. Tekh. (USSR)*, vol.25, no.2, p.25-30 (1982).
The author examines the question of reducing the class of boundary-value problems with one dominant direction of viscous incompressible fluid flow to an evolutionary initial-boundary value problem. He introduces functions which reduce the order of the Navier-Stokes (Reynolds) differential equations and transform the elliptic-type equations to quasihyperbolic. (6 refs.)

101180 The influence of a laminar boundary layer and laminar injection on film cooling performance. R.J.Goldstein (Dept. of Mech. Engng., Univ. of Minnesota, Minneapolis, MN, USA), T.Yoshida.
Trans. ASME. J. Heat Transfer (USA), vol.104, no.2, p.355-62 (May 1982).
Measurements are reported of the film cooling effectiveness and heat transfer following injection of air into a mainstream of air. A single row of circular injection holes inclined at an angle of 35 deg is used with a lateral spacing between the holes of 3 dia. Low Reynolds number mainstream and injection flow permit studying the influence of a laminar approaching boundary layer and laminar film coolant flow. Measurements of the surface heat transfer taken with no injection indicate that the hole openings can effectively trip the laminar boundary layer into a turbulent flow. The type of the approaching boundary layer has relatively little influence on either the adiabatic effectiveness or the heat transfer with film cooling. The importance of the nature of the injected flow on film cooling performance can at least be qualitatively explained by the differences in the transport mechanisms and in the penetration of the injected air into the mainstream. 101181 Further experiments on shock tube wall boundary-layer transition. M.J.Chaney, W.J.Cook (Iowa State Univ., Ames, IA, USA).
AIAA J. (USA), vol.21, no.7, p.1046-8 (July 1983).
There have been numerous reports supporting the concept that environmental disturbances cause laminar-to-turbulent transition in unsteady shock-tube wall boundary layers in a Reynolds number regime where the laminar boundary layers is theoretically stable. Experimental data is presented of the effects on transition of environmental disturbance which originate during the shock-tube driving process. (6 refs.)

47.20 HYDRODYNAMIC STABILITY

101182 Rayleigh-Taylor instability and the use of conformal maps for ideal fluid flow. R.Menikoff, C.Zemach (Theoretical Div., Los Alamos Nat. Lab., Los Alamos, NM, USA).
J. Comput. Phys. (USA), vol.51, no.1, p.28-64 (July 1983).
Potential theory permits ideal fluid dynamics to be formulated in terms of boundary motion. In two dimensions, the flow can then be found using conformal mapping. The evolution of some Rayleigh-Taylor instabilities is calculated well into the large amplitude nonlinear regime. The Rayleigh-Taylor calculation for Atwood ratio unity is used as a prototype for a system of theoretical and numerical techniques exploiting complex variable-theory and high-order quadrature methods. (15 refs.)

101183 A note on the stability of low-Prandtl-number Hadley circulations. J.Hart (Dept. of Astrogeophys., Univ. of Colorado, Boulder, CO, USA).
J. Fluid Mech. (GB), vol.132, p.271-81 (July 1983).
Discusses the stability of the flow of a low-Prandtl-number liquid contained in a shallow slot with differentially heated vertical endwalls. The effect of thermally insulating boundaries at the top and bottom of the container on wavelength selection is emphasized. Stability calculations indicate that, for Prandtl number Pr in the range $0.015<Pr<0.27$, the first perturbations to grow are overstable (oscillatory) longitudinal rolls with axes perpendicular to the endwalls, and with very large cross-stream wavelengths of about 9 to 15 layer depths. Previous studies using thermally conducting boundaries predict critical wavelengths of about three layer depths. The new results are in substantial agreement with an experiment using a differentially heated layer of mercury with aspect ratio (depth/length) 0.047 in both horizontal directions. The implications of the long-wavelength instability for the interpretation of thermal oscillations observed in other smaller-aspect-ratio configurations is discussed. (7 refs.)

101184 A spanwise structure in the plane shear layer. J.Jimenez (IBM Sci. Center, Madrid, Spain).
J. Fluid Mech. (GB), vol.132, p.319-36 (July 1983).
The author studies experimentally the spanwise structure of the mean flow field of a plane shear layer. The field is dominated by a lateral undulation that persists downstream to form long longitudinal structures. Both the amplitude and spacing of these structures vary in such a way as to suggest that they are due to a secondary instability of the flow field. Some models for this instability are discussed and compared with the experimental results. (23 refs.)

101185 Stability of a film flowing down along an oscillating surface. V.I.Baikov, A.T.Listrov, Z.A.Shabunina (A.V. Lykov Inst. of Heat & Mass Transfer, Acad. of Sci., Minsk, Belorussian SSR).
J. Eng. Phys. (USA), vol.43, no.6, p.1413-18 (Dec. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.6, p.1006-12 (Dec. 1982).
The linear approximation for a harmonically oscillating surface is used to obtain the condition of flow stability for a liquid film. (4 refs.)

101186 Generation of a countable set of homoclinic flows through bifurcation. P.Gaspard (Faculte des Sci., Univ. Libre de Bruxelles, Brussels, Belgium).
Phys. Lett. A (Netherlands), vol.97A, no.1-2, p.1-4 (8 Aug. 1983).
A class of three-variable nonlinear differential equations possessing a homoclinic orbit is considered. It is shown that a countable set of perturbed flows, each containing a homoclinic orbit which crosses twice any surface transverse to the original homoclinic orbit, is generated through bifurcation. 47.25 TURBULENT FLOWS, CONVECTION, AND HEAT TRANSFER

101187 Viscous flow in corner regions with a moving wall and leakage of fluid. J.Riedler (Gebruder Sulzer AG, Winterthur, Switzerland), W.Schneider.
Acta Mech. (Austria), vol.48, no.1-2, p.95-102 (1983).
The present work concerns the slow motion of a viscous fluid near a corner of plane rigid walls. The flow is mainly caused by the in-plane motion of one of the walls, but it can also be effected by a mass source or sink due to leakage at the wall intersection. Such flows are of considerable practical interest as they locally appear at the edge of a blade used to scrape up liquid from a surface, in a cylinder with a moving piston, or in a screw extruder. (10 refs.)

101188 A theory for flow separation. W.S.Vorus (Dept. of Naval Architecture & Marine Engng., Univ. of Michigan, Ann Arbor, MI, USA).
J. Fluid Mech. (GB), vol.132, p.163-83 (July 1983).
The author proposes a high-Reynolds-number theory for the approximate analysis of timewise steady viscous flows. Its distinguishing feature is linearity. But it differs fundamentally from Oseen's (1910) well-known linear theory. The theory is developed for a 2-dimensional body moving through an infinite incompressible fluid. The velocity-vorticity formulation is employed. A boundary integral expressing the body contour velocity is written in terms of Green functions of the approximate governing differential equations. The boundary integral contains three unknown boundary distributions. These are a velocity source density, the boundary vorticity, and the normal gradient of the boundary vorticity. The unknown distributions are determined as the solutions to a boundary-integral equation formed from the velocity integral by the prescription of zero relative fluid velocity on the body boundary. (5 refs.)

101189 Resistance and stability of a line of particles moving near a wall. S.L.Goren (Dept. of Chem. Engng., Univ. of California, Berkeley, CA, USA).
J. Fluid Mech. (GB), vol.132, p.185-96 (July 1983).
Corrections to Stokes' law are determined to first order in a/b and a/h for a sphere of radius a in a one-dimensional array of identical spheres having centre-to-centre-spacing b and translating a distance h from a no-slip wall. When h/b is small the drag is greater than that given by Stokes's law; as h/b increases, the drag generally decreases and becomes less than that given by Stokes' law. Stability of the array is examined. Motion along the line of centres is found to be stable, but the other two motions are unstable. The wall is a stabilizing influence when motion is toward the wall and a destabilizing influence when motion is away from the wall. For motion parallel to the wall, the presence of the wall shifts the region of maximum stability to smaller wavelengths. Crowley's (1977) results, which neglect any influence of the wall, are approached for h/b greater than about 5. (10 refs.)

101190 Transition of Taylor-Gortler vortex flow in spherical Couette flow. K.Nakabayashi (Dept. of Mech. Engng., Nagoya Inst. of Technol., Nagoya, Japan).
J. Fluid Mech. (GB), vol.132, p.209-30 (July 1983).
The critical Taylor number, phenomena accompanying the transition to turbulence, and the cellular structure of Taylor-Gortler vortex in the flow between two concentric spheres, of which the inner one is rotating and the outer is stationary, are investigated using three kinds of flow-visualization technique. The critical Taylor number generally increases with the ratio β of clearance to inner-sphere radius. For $\beta \leq 0.08$, the critical Taylor number in spherical Couette flow is smaller than in circular Couette flow, but vice versa for $\beta > 0.08$. A pair of toroidal Taylor-Gortler vortices occurs first around the equator at the critical Reynolds number R_{ec} (or critical Taylor number T_c). More Taylor-Gortler vortices are added with increasing Reynolds number R_e. After reaching the maximum number of vortex cells, as R_e is increased, the number of vortex cells decreases along with the various transition phenomena of Taylor-Gortler vortex flow, and the vortex finally disappears for very large R_e, where the turbulent basic flow is developed. The instability mode of Taylor-Gortler vortex flow depends on both β and R_e. The vortex flows encountered as R_e is increased are toroidal, spiral, wavy, oscillating (quasiperiodic), chaotic and turbulent Taylor-Gortler vortex flows. (15 refs.)

101191 On the prediction of pipe freeze-shut in turbulent flow. M.Epstein (Fauske & Associates Inc., Willowbrook, IL, USA).
Trans. ASME. J. Heat Transfer (USA), vol.104, no.2, p.381-4 (May 1982).
Solidification in steady, turbulent pipe flow with a constant, uniform wall temperature has been analyzed as an entrance region problem both by Shibani and Ozisik (1977) and by Thomason, et al. (1978). By ignoring the thermal entrance region, known to be short for highly turbulent flow and Prandtl numbers above ~0.5, the authors obtain a simple, asymptotic closed-form solution for the problem and use it to predict the conditions for the onset of freeze-shut in a pipe containing turbulent water flow. The observations of Gilpin (1979) of the development of ice waves in internal solidification are used to fix the limitations of the authors results. (7 refs.)

47.25C Isotropic turbulence

101192 Turbulence modeling for computational aerodynamics. J.G.Marvin (NASA Ames Res. Center, Moffett Field, CA, USA).
AIAA J. (USA), vol.21, no.7, p.941-55 (July 1983).
During the last decade advances in computational aerodynamics have increased the ability to compute more complex flows and the burden of establishing limits of applicability for turbulence modeling has increased proportionately. For those unfamiliar with the progress and direction of the modeling of external flows, the paper provides a perspective from which to view further developments certain to come in the next decade. For those entering the field of computational aerodynamics and who are interested in using various models in their computations, it provides a basis of reference and, it is hoped, help them avoid unnecessary difficulties. For those active in the field, it should simply reinforce what they already know about the problems of modeling, although it may also suggest some new ways to view combined computational and experimental investigations. (110 refs.)

101193 Constraints on the invariant functions of axisymmetric turbulence. E.J.Kerschen (General Electric Co., Schenectady, NY, USA).
AIAA J. (USA), vol.21, no.7, p.978-85 (July 1983).
Constraints are derived for the two invariant functions Q_1 and Q_2 that occur in Chandrasekhar's development of the axisymmetric turbulence theory. These constraints must be satisfied for the correlation tensor derived from Q_1 and Q_2 to be that of a stationary random process, i.e. for the turbulence to be realizable. The equivalent results in spectrum space are also developed. Applications of the constraints in aerodynamic noise modeling are discussed. It is shown that significant errors in prediction can be introduced by the use of turbulence models which violate the constraints. (24 refs.)

101194 Numerical investigation of 'lateral' interaction with an obstacle of an axisymmetric jet exhausting into vacuum. N.S.Mironchuk, N.E.Khramov.
Fluid Dyn. (USA), vol.17, no.6, p.855-9 (Nov.-Dec. 1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Zhidk. & Gaza,* vol.17, no.6, p.49-54 (Nov.-Dec. 1982).
The problem of the interaction of a strongly underexpanded axisymmetric jet with an obstacle for which the normal to the surface makes an angle near $\pi/2$ with the jet axis is rather laborious for numerical solution due to the high disequilibrium of the gas-dynamic parameters in the peripheral part of the jet and the three-dimensional nature of the flow in the interaction region. The authors study the case when a jet exhausts into vacuum and in front of the obstacle there is a detached shock wave, behind which there is mixed subsonic and supersonic three-dimensional flow. (10 refs.)

101195 Tests of subgrid models in the near-wall region using represented velocity fields. Y.Kaneda, D.C.Leslie (Dept. of Nuclear Engng., Queen Mary Coll., London, England).
J. Fluid Mech. (GB), vol.132, p.349-73 (July 1983).
The 2.5-dimensional model of the turbulent field near a wall, proposed by Hatziavramidis and Hanratty (1979) and modified by Chapman and Kuhn (1981), has been used to test the subgrid models of Schumann (1973, 1975) and Moin and Kim (1982). The results are disquieting, both trends and orders of magnitude sometimes being seriously in error. It also appears that the contribution of the subgrid energy to the pseudopressure calculated in large-eddy simulations can be large, although this contribution is usually neglected. On the positive side, Leonard's model for the Leonard stress is extremely good, and Schumann's synthetic boundary condition is also found to be reliable. (19 refs.)

101196 Time-dependent density profiles in a filling box. M.G.Worster, H.E.Huppert (Dept. of Appl. Maths. & Theoretical Phys., Univ. of Cambridge, Cambridge, England).
J. Fluid Mech. (GB), vol.132, p.457-66 (July 1983).
An approximate analytic expression for the time-dependent density profile formed by a turbulent buoyant plume in a confined region is presented. The analysis is based on the approximation that the density of the fluid behind the first front changes at a rate which is virtually independent of position. The approximate expression is shown to be in excellent agreement with a full numerical integration of the governing equations. (8 refs.)

101197 Effect of a change of the turbulent structure of a flow on unsteady heat exchange upon heating of gases and liquids in pipes. G.A.Dreitser (Sergo Ordzhonikidze Moscow Aviation Inst., Moscow, USSR).
J. Eng. Phys. (USA), vol.43, no.6, p.1320-6 (Dec. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR),* vol.43, no.6, p.898-905 (Dec. 1982).
Presents the results of experimental investigations of the unsteady heat exchange upon heating of gases and liquids and of the change in heat liberation from the pipe walls, as well as of the generalization of the experimental data which confirm the model of the effect of a change in the turbulent structure of the flow on the heat exchange. (8 refs.)

101198 Turbulent flow in an axially rotating pipe (effect of inlet swirl). M.Murakami, K.Kikuyama, K.Nishibori (Dept. of Mech. Engng., Nagoya Univ., Nagoya, Japan), O.Kito.
Mem. Fac. Eng. Nagoya Univ. (Japan), vol.34, no.2, p.284-92 (Nov. 1982).
The effect of the inlet swirl on the flow in an axially rotating pipe was investigated experimentally. The tangential component of velocities given by a honeycomb located at the pipe inlet shows a forced vortex type profile and the axial velocity component is approximately in a fully developed turbulent flow pattern. The tangential velocity profile, which exhibits a forced-vortex one, is deformed into a concave type, and the axial velocity profile becomes more convex as the flow goes downstream. The velocity profiles in this rotating pipe are also compared with those obtained without the inlet honeycomb. By use of a visualizing method the stabilizing effect of the pipe rotation on the flow is confirmed to be more remarkable in the pipe without the inlet honeycomb. (3 refs.)

47.25F Boundary layer and shear turbulence

101199 Two-scale semiempirical theory of turbulent boundary layers and jets. N.I.Akatnov.
Fluid Dyn. (USA), vol.17, no.6, p.827-34 (Nov.-Dec. 1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Zhidk. & Gaza,* vol.17, no.6, p.17-25 (Nov.-Dec. 1982).
To characterize the turbulence of boundary layers in the energy-bearing interval of wave numbers several turbulence scales are sometimes used. It is shown that the introduction of a second scale makes it possible to take into account the interaction of shear layers in flows with two shear layers (for example, a channel or jet), and also to take into account the influence of turbulence of

an external flow on a boundary layer. The interaction of shear layers is taken into account in theories containing a transport equation for the turbulent frictional stress τ_t, in which the essence of the interaction reduces to diffusion of τ_t from layer to layer. A predominant volume interaction effect is assumed which takes the form of a difference between the interaction of large-scale vortices with a shear deformation motion in flows with one and two shear layers, and also in the presence of turbulence in an external flow. (29 refs.)

101200 Stability of preseparation boundary layer on the leading edge of a thin airfoil. A.I.Ruban.
Fluid Dyn. (USA), vol.17, no.6, p.860-7 (Nov.-Dec. 1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Zhidk. & Gaza*, vol.17, no.6, p.55-63 (Nov.-Dec. 1982).
The author studies the stability of the boundary layer on the leading edge of a thin airfoil in a flow of incompressible fluid. The case when the angle of attack of the airfoil relative to the oncoming flow differs little from the critical value is considered. (24 refs.)

101201 Mass transfer across a sheared, wavy air-water interface. Y.Cohen (Dept. of Chem. Engng., Univ. of California, Los Angeles, CA, USA).
Int. J. Heat & Mass Transfer (GB), vol.26, no.9, p.1289-97 (Sept. 1983).
The influence of surface motion on liquid phase controlled mass transfer is reviewed. The influence of surface waves and water drift current on air-water exchange was explored theoretically and experimentally, in a laboratory wind-wave facility. The results were analyzed by a surface renewal model. It was found that capillary waves contributed significantly to the enhancement of mass transfer rates at low water friction velocities (for $U_w^* \lesssim 1.5$ cm s^{-1}). At higher friction velocities, the rather spectacular increase in mass transfer was associated primarily with the turbulent water drift current. A convenient correlation is proposed for the liquid phase mass transfer coefficient with the water side friction velocity as the only hydrodynamic parameter. (46 refs.)

101202 Scaling of the bursting frequency in turbulent boundary layers. R.F.Blackwelder, J.H.Haritonidis (Dept. of Aerospace Engng., Univ. of Southern California, Los Angeles, CA, USA).
J. Fluid Mech. (GB), vol.132, p.87-103 (July 1983).
The bursting frequency in turbulent boundary layers has been measured over the Reynolds-number range $10^3 < U_\infty\theta/\nu < 10^4$. When scaled with the variables appropriate for the wall region, the non-dimensional frequency was constant independent of Reynolds number. A strong effect of the sensor size was noted on the measured bursting frequency. Only sensors having a spatial scale less than twenty viscous lengthscales were free from spatial-averaging effects and yielded consistent results. The spatial-resolution problem was apparently the reason for erroneous results reported in the past. (31 refs.)

101203 An algorithmic approach to the linear stability of the Ekman layer. M.V.Melander (Inst. for Numerical Analysis, Tech. Univ. of Denmark, Lyngby, Denmark).
J. Fluid Mech. (GB), vol.132, p.283-93 (July 1983).
The linear stability of the stationary Ekman-layer flow near a plane boundary is considered. Analytical formulas for the eigenfunctions are derived by a spectral analysis. Standard optimization algorithms are used to calculate critical points, maximum growth rates and neutral-stability curves. The new approach provides a better basis for both a linear and a nonlinear stability analysis than the well-known methods have done. The method may also be applied to other boundary-layer problems. (7 refs.)

101204 Numerical calculations of a convective-dispersion equation in shear flow by method of shifting particles. K.Momii, K.Jinno (Dept. of Civil Engng. Hydraulics & Soil Mech., Kyushu Univ., Fukuoka, Japan).
Mem. Fac. Eng. Kyushu Univ. (Japan), vol.43, no.1, p.55-68 (March 1983).
The method of shifting particles is applied to the computations of a convective-dispersion equation in a shear flow. The effectiveness of this method is confirmed by the comparisons of numerical results with analytical solutions to the idealized model for turbulent shear flow. Since this method can consider the local variation of velocity in a flow field in the numerical computation, it is concluded that this method can accurately estimate not only the temporal variation of the longitudinal dispersion coefficient but also the spatial distribution of concentration. In addition to the above analysis, the authors also calculate the dispersion process in an actual turbulent shear flow. The effects of the viscous sublayer are discussed through these analytical and numerical results. It is concluded that the viscous sublayer offers the principal resistance to diffusion in a turbulent shear flow and the contribution of the viscous sublayer to the longitudinal dispersion coefficient increases with the increase in resistance to diffusion of the viscous sublayer. (10 refs.)

101205 Similarity solutions of free shear flows with mean Reynolds stress turbulence models. P.E.Wood, L.G.Leal (California Inst. of Chem. Engng., Pasadena, CA, USA).
Numer. Heat Transfer (USA), vol.6, no.2, p.235-44 (April-June 1983).
The authors present a numerical method for the calculation of free shear flows, using the governing mean Reynolds stress equations in their similarity form. Because the governing equations are nonlinear diffusion equations, and the diffusion coefficient is zero at the edge of the flow, the solutions are not analytic everywhere. Hence the solutions are confined to a finite region of the similarity variable space and it is necessary to calculate the width of this region as an eigenvalue as part of the solution. The calculation scheme is illustrated by using the plane turbulent jet. The authors also calculated the plane wake with a variety of models. Perhaps the most important feature of the present calculation scheme is that whole families of solutions for each flow can be determined for various values of the model parameters by using analytic continuation. Thus the sensitivity of the solution to changes in the parameters can be determined quickly, easily, and at a great savings in computation time. This makes the present approach ideally suited for model testing. (17 refs.)

101206 Influence of the viscoelastic properties of a liquid on the wall turbulence. V.N.Pilipenko, G.V.Kireiko (Sci.-Res. Inst. of Mech., M.V. Lomonosov State Univ., Moscow, USSR).
Sov. Phys.-Dokl. (USA), vol.27, no.11, p.911-13 (Nov. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.1-3, p.578-83 (Nov. 1982).
The authors use the monoharmonic model of the wall turbulence, which takes into account the three-dimensional character of the motion of the liquid, to examine the effect of the viscoelastic properties on the fluctuational and averaged characteristics of the flow. Calculations are done for the flow of liquids having Maxwellian or Oldroyd equations of state and different types of time derivatives. They discuss the questions of how the elasticity of the liquid and the behavioral features in a flow with longitudinal extension influence the reduction of the turbulent drag. (7 refs.)

101207 Spectral analysis of the thermal field in an axisymmetric turbulent plume. J.-M.Agator, Doan-Kim-Son (Lab. de Thermique, ENSMA, Poitiers, France).
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.15, p.1119-22 (25 April 1983). In French.
Temperature fluctuation spectra are determined on the axis of an axisymmetric turbulent thermal plume. The high frequencies region of the spectrum is found to be associated with the n^{-3} spectral law, introduced by Lumley, where n is the temperature fluctuation frequency. However, this law was observed in a restricted part of the flow. (15 refs.)

101208 Derivation of the fundamental equation of sound generated by moving aerodynamic surfaces. H.R.Aggarwal (Univ. of Santa Clara, Santa Clara, CA, USA).
AIAA J. (USA), vol.21, no.7, p.1048-50 (July 1983).
The author generalizes Lowson's (1965) concept of moving point singularities to moving surface singularities and gives a new derivation of the fundamental equation. The present derivation is based on topological considerations of the underlying space, the fluid medium, and the integral properties of the Dirac delta function. It is simple, direct, physical, and instructive. (6 refs.)

101209 Problems in flow acoustics. W.Mohring, E.-A.Muller, F.Obermeier (Univ. Gottingen, Gottingen, Germany).
Rev. Mod. Phys. (USA), vol.55, no.3, p.707-24 (July 1983).
The research field 'flow acoustics' is defined, and problems of current interest are discussed. The physical interpretation of fluid-mechanical sound sources for an acoustic medium, both at rest and in motion, is addressed. In the first case, it has been possible to relate the sound pressure field for low Mach numbers to sound sources that depend linearly on velocity; progress has been achieved by means of the causality correlation method with application of laser-Dopper velocity measurements. In the theory of the acoustic medium in motion, it has been found that vortices downstream from a nozzle discharge can function as sound sinks; for a unidirectional mean flow, conditions for the sound sources are developed on the basis of the causality principle and the boundedness of the flow quantities. Experimental and theoretical results for flowfield oscillations in a high-velocity duct flow with sudden duct enlargement are discussed. Finally, some points concerning the influence of shear flow on sound propagation are described. (234 refs.)

(see also 44.25 Convective and constrained heat transfer)

101210 Growth of fluctuations near the Benard-Marangoni convective instability. G.Lebon, A.Cloot (Liege Univ., Liege, Belgium).
Acta Mech. (Austria), vol.48, no.1-2, p.43-55 (1983).
The effects of temperature dependent surface-tensions on the growth rate of fluctuations near Benard-Marangoni's instability are examined. This is achieved by defining a new parameter ϵ measuring the deviation from the marginal state. The present analysis amplifies recent papers wherein surface effects were not considered. The behaviour of the growth rate in terms of the non-dimensional Rayleigh, Maragnoni, Biot, and Prandtl numbers is discussed. Landau's picture is finally used to study the approach of disturbances towards equilibrium. (17 refs.)

101211 Existence conditions for stationary state of a free convection flow in a confined medium. J.-F.Pignatel, J.Marcillat (Inst. de Mecanique des Fluids, Marseille, France).
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.14, p.1023-6 (18 April 1983). In French.
Transition from stationary to unsteady state of a free convection flow in an inclined air layer heated from below, is studied experimentally for tilt angles $0<\alpha<90°$, Rayleigh numbers $2\times10^3<\mathrm{Ra}<10^6$ and shape factors $2<1<18$. The transition criterion is based upon the time dependence of the response of a thermocouple junction placed along the upslope axis of the cavity. The results are reported in form of the evolution of critical Rayleigh number with the shape factor and the tilt angle. (10 refs.)

101212 Heat transfer in the desublimation of phthalic anhydride. J.Bilik (Design Office, Metalchem, Gliwice, Poland), R.Krupiczka.
Chem. Eng. J. (Switzerland), vol.26, no.3, p.169-80 (June 1983).
The heat transfer in the desublimation of phthalic anhydride has been investigated experimentally for the purpose of modelling and developing the design calculation procedure. Experiments were performed on a pilot installation connected to the industrial plant. On the basis of the experimental data, new correlations for the equivalent local heat transfer resistance and the mean equivalent density of the condensate were obtained. The formula for the equivalent heat transfer coefficient in the gaseous phase and the diagram for determination of the efficiency of the process are also given. The validity of the proposed formulae was verified by comparison of the calculated temperature profiles along the condenser with the measured values. (14 refs.)

101213 Heat transfer in temperature-dependent flow. K.Wichterle (Inst. of Chem. Process Fundamentals, Czechoslovak Acad. Sci., Prague, Czechoslovakia).
Chem. Eng. J. (Switzerland), vol.26, no.3, p.217-22 (June 1983).
Solutions of temperature and velocity fields near a constant-temperature wall are presented. For liquids with temperature-dependent Newtonian or non-Newtonian viscosity, the mathematical model of the system is represented by coupled partial differential equations. A similarity variable for the thermal entrance region has been introduced, which allows the partial differential equations to be transformed into ordinary ones. The procedure reduces to the well-known Leveque solution for temperature-independent flow. Exact solutions to the nonisothermal problem have been obtained, results of which can be expressed using the classical Leveque-Lighthill formula (for isothermal flow) supplemented by a simple correction term expressing the effects of variable viscosity. The correlation has been adapted to express explicitly the Nusselt number and pressure drop in the thermal entrance region of a circular tube. (8 refs.)

101214 Finite-amplitude convection in mixtures with heat sources proportional to the concentration of one of the components. A.K.Kolesnikov, V.I.Yakushin.
Fluid Dyn. (USA), vol.17, no.6, p.821-6 (Nov.-Dec. 1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Zhidk. & Gaza*, vol.17, no.6, p.10-16 (Nov.-Dec. 1982).
A numerical investigation has been made into the equilibrium stability with respect to finite perturbations of a mixture with heat sources proportional to the concentration of an active component. The convective motions that develop after the loss of stability were also studied. The equations of thermoconcentration convection were solved by the grid method for a planar region of rectangular shape simulating a convective cell in the horizontal layer. Neutral curves for finite-amplitude perturbations are constructed, the regions of existence of subcritical motions are found, and a comparison with the results of linear theory is made. (12 refs.)

101215 Oscillatory and steady convection in a nematic liquid crystal. K.Otnes, T.Riste (Inst. for Energy Technol., Kjeller, Norway).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.837-46 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
Demonstrates that a nematic liquid crystal in a vertical magnetic field is a convenient physical system for studying these phenomena, and that neutron scattering provides an ideal experimental tool. In the experiments that the authors report they used a setup that allowed them to study a wider range of temperature gradients and magnetic fields, thereby making it possible to disentangle most of the intricate phase diagram. The information that was obtained on the time behaviour of the order parameters and of the attractors in phase space is however still incomplete. (11 refs.)

101216 Hydrodynamics and heat transfer in sphere assemblages—cylindrical cell models. R.Tal, D.N.Lee, W.A.Sirignano (Carnegie-Mellon Univ., Pittsburgh, PA, USA).
Int. J. Heat & Mass Transfer (GB), vol.26, no.9, p.1265-73 (Sept. 1983).
In order to evaluate interactions between vaporizing fuel droplets, a cylindrical cell model based on a single sphere has been suggested by the authors in previous works as a replacement for the existing spherical cell model. Since wake effects are important, a multisphere cylindrical cell model has been developed in the present work. The Navier-Stokes and energy equations have been solved numerically within the representative cells for intermediate Reynolds numbers. Using a nonuniform mesh suited for the problem, several spheres in tandem are considered and the importance of wake effects in considerably reducing the drag and Nusselt number in the bulk is discussed. The quasiperiodic features of the results are indicated and compared favorably with a model assuming periodicity a priori. (28 refs.)

101217 Local mass transfer for cross flow through tube banks of square in-line layout at intermediate Reynolds numbers. I.A.Nieva, U.Bohm (Dept. de Industrias, Univ. de Buenos Aires, Buenos Aires, Argentina).
Int. J. Heat & Mass Transfer (GB), vol.26, no.9, p.1283-8 (Sept. 1983).
Local mass transfer rates around a circular tube placed in a tube bank of square in-line layout are measured by the electrochemical technique. Four different pitches are investigated and the results are compared with theoretical values and simpler geometries. (12 refs.)

101218 Domain dependence of critical Rayleigh numbers. J.S.Vrentas, C.M.Vrentas (Dept. of Chem. Engng., Pennsylvania State Univ., University Park, PA, USA), R.Narayanan.
Int. J. Heat & Mass Transfer (GB), vol.26, no.9, p.1299-305 (Sept. 1983).
The dependence of critical Rayleigh numbers for buoyancy-driven convection on the size of the domain is investigated. The method of parameter differentiation is used to establish monotonicity conditions for the Rayleigh number-geometry dependence for axisymmetric convection in a cylindrical container and for three-dimensional convection in a rectangular box. The dependence of the critical Rayleigh number on the Nusselt number is also studied. (10 refs.)

101219 Heat transfer in large particle fluidized beds. N.Decker, L.R.Glicksman (Dept. of Mech. Engng., MIT, Cambridge, MA, USA).
Int. J. Heat & Mass Transfer (GB), vol.26, no.9, p.1307-20 (Sept. 1983).
A physically based model is proposed for heat transfer to immersed surfaces in large particle fluidized beds. 'Large' particles are distinguished as those with thermal time constants substantially greater than their residence time at a heat transfer surface. At typical fluidized bed combustor operating conditions, particles 1 mm or larger are 'large'. Conduction through the gas near points of solid contact and convection by the interstitial gas flow both contribute to heat transfer during emulsion (or dense phase) contact. As particle size increases the heat transfer by gas convection provides a greater share of the heat transfer. It is shown that the gas convective component in fluidized bed heat transfer is not simply related to overall gas convection in a packed or quiescently fluidized bed. The model is shown to provide good agreement with data from several sources. (20 refs.)

101220 Influence of buoyancy forces and thermal conductivity on flow field and heat transfer of circular cylinders at small Reynolds number. B.Sunden (Dept. of Appl. Thermo & Fluid Dynamics, Chalmers Univ. of Technol., Goteborg, Sweden).
Int. J. Heat & Mass Transfer (GB), vol.26, no.9, p.1329-38 (Sept. 1983).
A numerical investigation of the influence of buoyancy forces and thermal conductivity ratio (k_s/k_f) on the flow field and heat transfer around circular cylinders is presented. The flow field and energy equations are solved under the conditions of continuity in temperature and heat flux at the fluid-solid interface. The buoyancy forces are taken into account by applying Boussinesq's approximation. Numerical results are given for Reynolds numbers in the range of $5 \leq Re \leq 40$, buoyancy parameters in the range of $-1 \leq Gr/Re^2 \leq 2$ and thermal conductivity ratios in the range of $0 \leq k_s/k_f \leq \infty$. (39 refs.)

101221 The boundary layer regime in a porous layer with uniform heat flux from the side. A.Bejan (Dept. of Mech. Engng., Univ. of Colorado, Boulder, CO, USA).
Int. J. Heat & Mass Transfer (GB), vol.26, no.9, p.1339-46 (Sept. 1983).
Reports an analytical solution and a numerical study of natural convection in a rectangular porous layer heated and cooled with uniform heat flux along the vertical side walls. It is shown analytically that in the boundary layer regime the vertical boundary layer thickness is constant (independent of altitude) and the core region is motionless. The vertical temperature gradient is the same constant everywhere in the porous layer. Numerical results are reported in the range $100 < Ra < 5000$, $1 \leq H/L \leq 10$, where $Ra = Kg\beta H^2 q''/(\alpha\nu k)$. The boundary layer analytical solution is shown to agree well with the numerical results. (20 refs.)

101222 Investigation of heat transfer behind an oscillating grid. W.Kuhn (Inst. fur Mech., Akad. der Wissenschaften, Berlin, Germany).
Int. J. Heat & Mass Transfer (GB), vol.26, no.9, p.1347-55 (Sept. 1983).
Measurements of heat transfer behind a harmonically oscillating grid yielded rates of heat spread which were higher than those in usual turbulent flows produced by stationary grids. The mean temperature profiles showed an unexpected shape with two maxima and a minimum between them. This was caused by large-scale velocity fluctuations which produce heat fluxes independent of the local mean temperature gradient. A simple heat transfer model is proposed which takes into account both the large-scale velocity fluctuations produced by the oscillating grid and the 'usual' turbulence. The calculated mean temperature profiles show a good agreement with the measured ones. (5 refs.)

101223 A refutation of King's rule for multi-dimensional external natural convection. E.M.Sparrow, M.A.Ansari (Dept. of Mech. Engng., Univ. of Minnesota, Minneapolis, MN, USA).
Int. J. Heat & Mass Transfer (GB), vol.26, no.9, p.1357-64 (Sept. 1983).
Experiments have been carried out to test the validity of King's widely quoted rule for evaluating a characteristic length for problems of multi-dimensional external natural convection. A more recent rule set forth by Lienhard (1981) was also tested. Both rules are intended to enable standard textbook-type correlations to be employed to predict natural convection heat transfer from complex bodies. The experiments were performed using a heated vertical cylinder of equal height and diameter, with heat being transferred to the ambient air from all three faces of the body (top, side, and bottom). The use of King's rule led to 40-50% overpredictions of the experimental data, so that its continued citation in textbooks appears inappropriate. Although Lienhard's rule yielded predictions that were somewhat closer to the data than those of King, the level of agreement does not appear to warrant its adoption as the link between multi-dimensional natural convection and the established literature correlations. (15 refs.)

101224 Heat transfer in vertical upwards gas-liquid slug flow. D.Barnea, N.Yacoub (School of Engng., Tel-Aviv Univ., Tel-Aviv, Israel).
Int. J. Heat & Mass Transfer (GB), vol.26, no.9, p.1365-76 (Sept. 1983).
An analytical solution for the transient behaviour of heat transfer in vertical upward gas-liquid slug flow is presented. The results allow the prediction of the temperature variation with time and location and the wall temperature fluctuations, as well as the average heat transfer coefficients. (10 refs.)

101225 Forced convective heat transfer in the entrance region of a parallel plate channel. R.Das, A.K.Mohanty (Dept. of Mech. Engng., Indian Inst. of Technol., Kharagpur, India).
Int. J. Heat & Mass Transfer (GB), vol.26, no.9, p.1403-5 (Sept. 1983).
Laminar convective transport in the channel entrance region has received considerable attention because in several internal flow situations the length to diameter ratio is not adequate to ensure fully developed conditions. Leading edge effects result in high transport rates. Immediately downstream of the entry, the flow is laminar, irrespective of the diameter based Reynolds number, thereby allowing theoretical evaluations to be made. The simultaneous development in the entrance of a parallel plate channel is analyzed incorporating the two-zone hydrodynamic model and the centre-line temperature variation. Both isothermal wall ($T_w = C$) and uniform heat flux ($Q_w = C$) conditions are considered. (7 refs.)

101226 Heat transfer from partially insulated hexagonal ducts. R.M.Abdel-Wahed, A.E.Attia (Dept. of Mech. Engng., Univ. of Alexandria, Alexandria, Egypt).
Int. J. Heat & Mass Transfer (GB), vol.26, no.9, p.1408-12 (Sept. 1983).
The authors generate theoretical Nusselt values for the fully developed laminar flow inside partially insulated hexagonal ducts receiving constant axial heating. In view of the thermal condition around the duct periphery at a given axial location, the thermal situation on the solid exposed boundary can be further classified. Two such subcategories are considered, namely, the isothermal and the uniform heat flux peripheries. (12 refs.)

101227 Magnetohydrodynamic natural convection heat transfer from horizontal cylinders. P.F.Dunn (Engng. Div., Argonne Nat. Lab., Argonne, IL, USA).
Int. J. Heat & Mass Transfer (GB), vol.26, no.9, p.1413-16 (Sept. 1983).
Presents an approximate 2-dimensional solution of magnetohydrodynamic (MHD) natural convection heat transfer from a finite cylinder at various orientations with respect to an applied magnetic field. The work is an extension of that of Lykoudis and Dunn (1973) in which they measured and successfully predicted the MHD natural convection heat transfer from hot-film probes aligned axially with a horizontal magnetic field. (19 refs.)

101228 Comments on 'The effect of subchannel shape on heat transfer in rod bundles with axial flow'. J.T.Rogers (Dept. of Mech. & Aeronautical Engng., Carleton Univ., Ottawa, Ontario, Canada).
Int. J. Heat & Mass Transfer (GB), vol.26, no.9, p.1417-18 (Sept. 1983).
For original paper see W.J. Seale, ibid., vol.24, no.4, p.768 (1981). Seale's paper provides a useful addition to the knowledge of inter-subchannel heat exchange in rod bundles such as those used in nuclear power reactor fuel assemblies. He makes certain comparisons of his theoretical predictions for heat flow by turbulent interchange between two subchannels simulating a section of a rod array with predictions obtained by Rogers and Rosehart (1972). Rogers comments on the conclusions drawn by Seale. (4 refs.)

101229 Heat exchange under viscid fluid rotation between two concentric spheres. F.M.Ibragimov.
Izv. Akad. Nauk Az. SSR Ser. Fiz.-Tekh. & Mat. Nauk (USSR), no.4, p.123-7 (1982). In Russian.
Some problems concerned with heat exchange in a viscid fluid under rotation between two concentric spheres are studied. The stationary problem is solved when the viscidity is $\mu = \text{const.}$ and then temperature dependent in accordance with the hyperbolical law. (5 refs.)

101230 Critical heat flux in free convective flow through a uniformly heated vertical tube held in a large pool of saturated liquid. Y.Katto, S.Kawamura (Dept. of Marine Engng., Univ. of Tokyo, Tokyo, Japan).
J. Fac. Eng. Univ. Tokyo Ser. B (Japan), vol.36, no.4, p.647-59 (Sept. 1982).
Experiments are made on free convection boiling in uniformly heated tubes held vertically in a large pool of saturated liquid. The length l and diameter d of test tube ranges from 100 to 800 mm and from 4.0 to 10 mm respectively. Under stable conditions where no flow oscillations are detected, critical heat flux (CHF) q_{co} is measured for water at 1.0-8.8 bar and R-12 at 7.5-32 bar. Based on the experimental data of CHF thus obtained together with the existing data of helium I at atmospheric pressure, an attempt is made to derive a simple generalized correlation of CHF in terms of two dimensionless groups $(q_{co}/\rho_v H_{fg})/[\sigma g(\rho_l-\rho_v)/\rho_v^2]^{1/4}$ and l/d. The generalized correlation of water data is found to agree with that of helium data in spite of a large difference of physical properties, whereas R-12 shows a somewhat different trend and also greater dispersion of data. Finally, related discussion is made, in which the CHF mechanism encountered in this study is suggested to differ from that in a heated vertical tube forming part of a natural circulation loop having a noticeable flow resistance due to throttle valves and the like. (17 refs.)

101231 Instabilities of dynamic thermocapillary liquid layers. I. Convective instabilities. M.K.Smith, S.H.Davis (Dept. of Engng. Sci. & Appl. Maths., Technol. Inst., Northwestern Univ., Evanston, IL, USA).
J. Fluid Mech. (GB), vol.132, p.119-44 (July 1983).
A planar liquid layer is bounded below by a rigid plate and above by an interface with a passive gas. A steady shear flow is set up by imposing a temperature gradient along the layer and driving the motion by thermocapillarity. This dynamic state is susceptible to two types of thermal-convective instabilities: (i) stationary longitudinal rolls, which involve the classical Marangoni instability studied by Pearson (1958); and (ii) unsteady hydrothermal waves, which involve a new mechanism of instability deriving its energy from the horizontal temperature gradients. Thermal stability characteristics for liquid layers with and without return-flow profiles are presented as functions of the Prandtl number of the liquid and the Biot number of the interface. Comparisons are made with available experimental observations. (25 refs.)

101232 Unidirectional nonstationary flow of instantaneously heated gas from a cylinder for different positions of the heated zone. E.T.Bruk-Levinson, O.G.Martynenko, E.A.Romashko (A.V. Lykov Inst. of Heat & Mass Transfer, Acad. of Sci., Minsk, Belorussian SSR).
J. Eng. Phys. (USA), vol.43, no.6, p.1425-31 (Dec. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.6, p.1020-7 (Dec. 1982).
The finite-difference method and one-dimensional approximation are used to consider the processes of decay of an initial pressure discontinuity for the individual cases of its position in a bounded region. (6 refs.)

101233 Heat transfer between three media in triple countercurrent pipe flow. E.E.Shpil'rain, K.A.Yakimovich.
J. Eng. Phys. (USA), vol.43, no.6, p.1431-6 (Dec. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.6, p.1028-33 (Dec. 1982).
A method is discussed for calculating the thermodynamic characteristics associated with the interaction of three fluid flows in pipes. Analytical relations are derived for the case of triple concentric countercurrent flow. (no refs.)

101234 Effect of variable thermophysical properties of a viscous liquid on flow around and heat transfer from a cylinder in turbulent cross flow. P.P.Vaitekunas, A.Yu.Butola, A.A.Zhukauskas.
Liet. TSR Mokslu Akad. Darbai B Ser.(USSR), no.134, p.55-9 (1983). In Russian.
Palankar and Spalding's finite difference method is used to solve the heat transfer equations for the laminar boundary layer for turbulent cross flow past a cylinder. Numerical results are presented for shear stress and local heat transfer rates as a function of the direction of flow. The dimensionless data show the effects of thermal and physical properties on these parameters. The tube crown heat transfer coefficient is also calculated. The data cover ranges of Reynolds and Prandtl numbers from 10^3 to 10^5 and from 0.71 to 242 respectively. (no refs.) *C.J.S.*

101235 A boundary integral method for some laminar forced convection problems. A.Mir-Mohamad-Sadegh (Dept. of Mech. Engng., City Coll., City Univ. of New York, New York, NY, USA), K.R.Rajagopal.
Mech. Res. Commun. (GB), vol.10, no.3, p.181-6 (May-June 1983).
Forced convection problems involving laminar fully developed steady state flow in channels have been the object of detailed scrutiny for several years. A complex variable approach to solving a class of these forced convection problems analytically, has been developed by Tao (1960). The differential equations for the velocity and temperature fields essentially reduce to solving a single biharmonic equation in the domain of interest. While one can obtain closed form solutions for channels of simple cross-sections, one has to resort to a numerical solutions in the case of arbitrary cross-sections. The authors present a boundary integral method which is ideally suited for this class of problem. (5 refs.)

101236 Numerical study of high Rayleigh number convection in a vertical porous enclosure. G.S.Shiralkar, M.Haajizadeh, C.L.Tien (Dept. of Mech. Engng., Univ. of California, Berkeley, CA, USA).
Numer. Heat Transfer (USA), vol.6, no.2, p.223-34 (April-June 1983).
The results of a numerical simulation of natural convection in a vertical rectangular porous enclosure subjected to a horizontal temperature differential are presented. By use of the stable exponential differencing computation scheme, values of the Darcy-Rayleigh number R have been obtained which are substantially larger than those in previous numerical studies. The present results proved a clear physical picture of the development process as R is increased toward asymptotically high values ($R \rightarrow \infty$). Correlations for the heat transfer rate are presented for four different aspect ratios and are compared with earlier experimental and theoretical results. (11 refs.)

101237 Regimes of free thermally concentrated convection over a point heat source. Yu.D.Chashechkin, V.S.Belyaev (All-Union Sci.-Res. Inst. of Physicotech. & Radio Engng. Measurements, Mendeleevo, USSR).
Sov. Phys.-Dokl. (USA), vol.27, no.11, p.923-5 (Nov. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.1-3, p.574-7 (Nov. 1982).
The regimes of free thermally concentrated convection over a point heat source are studied using a tank filled with NaCl solution with a constant density gradient. The flow pattern was recorded using a motion picture method. The regimes described are the diffusion regime; the laminar stratified regime; the finger stratified regime and the intrusional regime. (12 refs.)

101238 Buoyancy-induced flow due to isolated thermal sources on a vertical surface. Y.Jaluria.
Trans. ASME. J. Heat Transfer (USA), vol.104, no.2, p.223-7 (May 1982).
The natural convection flow due to multiple isolated heated elements located on a vertical adiabatic surface has been studied analytically. The problem, which is of particular relevance to electronic circuitry cooling and to the question of locating sources in manufacturing systems, is considered for a Prandtl number of 0.7, which applies for air. Of particular interest were the temperature and velocity fields that arise and the dependence of these on the heat input and on the distance between the heated elements. The flow is treated as a boundary layer problem and the governing equations are solved numerically. The results obtained indicate the general nature of the flow and the dependence of the heat-transfer coefficient for an element, located in the wake of another, on the energy input and location. The downstream variation of the surface temperature, the velocity level, and the resulting velocity and temperature profiles are studied in detail. The results obtained are also compared with those for a single source, bringing out several interesting features. (13 refs.)

101239 Natural convection from a horizontal cylinder—turbulent regime. B.Farouk (Mech. Engng. & Mech. Dept., Drexel Univ., Philadelphia, PA, USA), S.I.Guceri.
Trans. ASME. J. Heat Transfer (USA), vol.104, no.2, p.228-35 (May 1982).
A two-equation model has been adopted in obtaining numerical solutions of turbulent natural convection from an isothermal horizontal circular cylinder. The k-ϵ model employed in this study characterizes turbulence through the kinetic energy and its volumetric rate of dissipation. The transport equations for these two variables, along with those for time-averaged stream function, vorticity, and temperature, form a closed set of five coupled partial differential equations. These equations are solved for the entire flow domain, without boundary layer approximations. Buoyancy effects on the turbulence structure are also accounted for. Results are presented for a Rayleigh number range of 5×10^7 to 10^{10} and the average Nusselt numbers are compared with existing correlations and limited available experimental data. (23 refs.)

101240 Natural convection in an attic-shaped space filled with porous material. A.Bejan, D.Poulikakos (Dept. of Mech. Engng., Univ. of Colorado, Boulder, CO, USA).
Trans. ASME. J. Heat Transfer (USA), vol.104, no.2, p.241-7 (May 1982).
Reports on analytical study of natural convection in a wedge-shaped horizontal space filled with a fluid-saturated porous medium. The study focuses on the detrimental effect of natural convection on the insulation value of an attic-shaped porous layer in 'winter' conditions (cold roof, warm ceilings). The study reveals the most basic features of the temperature field and flow pattern established in the porous layer. The study addresses two distinct flow regimes: (a) the shallow attic limit ($H/L \rightarrow 0$, Ra_H=finite, but fixed) and (b) the boundary layer regime which consists of a boundary layer driven by the sloped (roof) wall plus a core flow moving slowly along the horizontal (ceiling) wall. Heat-transfer results are developed for both flow regimes. (11 refs.)

101241 Structure of growing double-diffusive convection cells. Y.Suzukawa, U.Narusawa (Tech. Res. Center, Nippon Kokan KK, Kawasaki, Japan).
Trans. ASME. J. Heat Transfer (USA), vol.104, no.2, p.248-54 (May 1982).
When a fluid with a vertical route gradient is heated from a sidewall, layers of convection cells form along the wall. For an acqueous solution of common salt (i.e. fixed values of Pr and τ), the convection cells will form along the vertical heated wall for values of $\pi(=\alpha(q/k)/\beta(-dS/dz))$ greater than ~ 0.28. This paper reports the experimental investigation of the structure of the growing convection cells when a uniform heat flux is applied at the vertical wall. A series of tests was conducted using a small tank (23 cm high × 16 cm deep × 20 cm wide). Measurements of the vertical temperature distribution in the fluid at five different locations were taken continuously along with shadowgraph pictures to monitor the growth of the convection cells. Based on the set of data thus obtained, the following characteristics of a growing convection cell were found: (a) A convection cell with a vertical height, K, grows laterally into the quiescent fluid at a constant speed, U, and the Reynolds number of a moving front, defined as UH/ν, changes linearly with π on a log-log scale for our experimental range of $\pi=0.3-10$. (b) The vertical averaged temperature inside a growing cell is a linear function of the distance from the heated wall over a major portion of the cell. (c) The lateral temperature gradient inside a cell decreases with time, and is proportional to the inverse of the elapsed time. (22 refs.)

101242 An application of the optical correlation computer to the detection of the Malkus transitions in free convection. E.F.C.Somerscales (Rensselaer Polytech. Inst., Troy, NY, USA), H.B.Parsapour.
Trans. ASME. J. Heat Transfer (USA), vol.104, no.2, p.255-63 (May 1982).
Presents the results of an investigation concerned with measurements of the scale-size of the flow patterns near the so-called Malkus transitions. The flow patterns in a heated fluid layer were photographed at various Rayleigh numbers and these photographs subjected to quantitative analysis using an optical correlation computer. The results showed that the method provides a very sensitive technique for locating the transitions. Transition reported by other investigators have been confirmed for Rayleigh numbers between 5.0×10^3 and 1.0×10^6, and an additional, previously unobserved, transition has been detected. Heat-transfer measurments were also made. This data demonstrated the limitations, compared to the optical method, of this approach to the detection of transitions. (35 refs.)

101243 Volumetric heat-transfer coefficients for direct-contact evaporation. R.C.Smith, W.M.Rohsenow, M.S.Kazimi (Dept. of Nuclear Engng., MIT, Cambridge, MA, USA).
Trans. ASME. J. Heat Transfer (USA), vol.104, no.2, p.264-70 (May 1982).
An analytical model has been developed for calculating volumetric heat-transfer coefficients for direct-contact evaporation. Heat transfer is modeled using single droplet correlations for the Nusselt number, while the fluid dynamics are described by a drift-flux model. The analysis is divided into a preagglomerative and a postagglomerative stage on the basis of an assumed maximum value for the dispersed phase volume fraction. The analytical results showed good agreement with data obtained from an experimental direct-contact evaporator using cyclopentane and water. (9 refs.)

101244 Critical heat flux during natural convective boiling in vertical rectangular channels submerged in saturated liquid. M.Monde, H.Kusuda, H.Uehara (Dept. of Mech. Engng., Saga Univ., Saga, Japan).
Trans. ASME. J. Heat Transfer (USA), vol.104, no.2, p.300-3 (May 1982).
An experimental study of the critical heat flux has been carried out for natural convective boiling at atmospheric pressure in vertical rectangular channels. Experiments in four kinds of test liquids (water, ethanol, freon 113, and benzene) have been made for the ratio l/s less than 120, in which l is the length of the heated surface and s is the width of the channels. A generalized correlation for the critical heat-flux data in the four test liquids is evolved. (19 refs.)

101245 Effect of laminarization and retransition on heat transfer for low Reynolds number flow through a converging to constant area duct. H.Tanaka (Dept. of Mech. Engng., Univ. of Tokyo, Tokyo, Japan), H.Kawamura, A.Tateno, S.Hatamiya.
Trans. ASME. J. Heat Transfer (USA), vol.104, no.2, p.363-71 (May 1982).
A fully developed turbulent air flow between two parallel plates with the spacing of 15 mm was accelerated through a linearly converging passage of 200 mm in length, from which it flowed into a parallel-plate channel again. A foil heater was fastened on one wall surface over the entire channel, and local heat-transfer coefficient distribution was measured over the channel Reynolds number range of 5000 to 14000 and also the slope of the accelerating section between 2/200 mm/mm and 10/200 mm/mm. (The acceleration parameter K ranged between 1.4×10^{-6} and 2×10^{-5}). The Nusselt number at the outlet of the accelerating section was considerably lower than in the initial fully turbulent state, suggesting laminarization of the flow. The measured Nusselt number continued to decrease in the first part of the downstream parallel-plate section to a minimum and then began to increase sharply, suggesting reversion to turbulent flow. Heat transfer along the parallel-converging-parallel plate system was reproduced fairly satisfactorily by applying a k-kL model of turbulence. (21 refs.)

101246 Heat transfer by conduction and radiation in one-dimensional planar media using the differential approximation. A.C.Ratzel (Sandia Nat. Labs., Albuquerque, NM, USA), J.R.Howell.
Trans. ASME. J. Heat Transfer (USA), vol.104, no.2, p.388-91 (May 1982).
The combined conduction and radiation heat-transfer problem for a gray planar medium is considered using the differential approximation. Two governing energy equations which include isotropic scattering are developed incorporating the P-1 and P-3 approximations for the intensity distribution. The method of solution for the resulting nonlinear ordinary differential equations is summarized along with representative results. (10 refs.)

47.30 ROTATIONAL FLOW AND VORTICITY

101247 Explicit theory of the median layer associated with a vortex sheet. M.Mudry (Univ. d'Orleans, Orleans, France).
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.15, p.1109-12 (25 April 1983). In French.
It is shown that a vortex sheet can be characterized by a nonunique couple of functions, the properties of which are specified. In the case of an incompressible inviscid fluid, the knowledge of the flow is always reducible to an integro-differential evolution problem regarding the sheet itself. (5 refs.)

101248 Finite difference representations of vorticity transport. M.Joseph.
Comput. Methods Appl. Mech. & Eng. (Netherlands), vol.39, no.2, p.107-16 (Aug. 1983).
Explicit finite difference representations of the steady two-dimensional laminar vorticity transport equation of fluid dynamics are summarized and discussed. The approximations known as 'upwind differencing', 'locally exact' after Allen and Southwell (1955), Briggs (1975) or Dennis and Hudson (1978) are all shown to be the central difference approximation with the addition of numerical diffusion of the order of the error term in cell Reynolds number, R_c, which makes the associated matrix diagonally dominant. The local truncation error of this type of approximation can be minimized thus: (i) for $|r_c|\leq2$, the central difference approximation, (ii) for $|R_c|>2$, upwind differencing applied to the inviscid equations, and therefore can be considered as a boundary layer approximation. This is the scheme introduced by Spalding (1972); successfully tested by Runchal (1972). The local truncation error of the boundary condition, after Woods (1954) for the vorticity is minimized in such a way that the formula is third-order accurate in grid size, in rectangular Cartesian coordinates. (39 refs.)

101249 Limiting amplitudes for forced oscillations in a rotating compressible fluid. P.K.Pal (Dept. of Differential Equations & Functional Analysis, Patrice Lumumba Friendship of Nations Univ., Moscow, USSR).
Indian J. Pure & Appl. Math., vol.14, no.6, p.671-9 (June 1983).
On the basis of the linearised equations of motion, it is shown that for the motion generated in an infinite mass of rotating compressible fluid, by a distribution of periodic forces and sources satisfying certain conditions, the ultimate state of motion is periodic. The limiting amplitude for the motion is obtained. (8 refs.)

101250 Practical use of Hamilton's principle. R.Salmon (Scripps Instn. of Oceanography, La Jolla, CA, USA).
J. Fluid Mech. (GB), vol.132, p.431-44 (July 1983).
Hamilton's principle of mechanics has special advantages as the beginning point for approximations. First, it is extremely succinct. Secondly, it easily accommodates moving disconnecting fluid boundaries. Thirdly, approximations—however strong—that maintain the symmetries of the Hamiltonian will automatically preserve the corresponding conservation laws. For example, Hamilton's principle allows useful analytical and numerical approximations to the equations governing the motion of a homogeneous rotating fluid with free boundaries. (15 refs.)

101251 Some problems of the hydrodynamics of a horizontal cylinder with natural convection. V.A.Belyakov, P.M.Brdlik, V.S.Kuptsova, V.G.Malinin (Moscow Forestry Inst., Moscow, USSR).
J. Eng. Phys. (USA), vol.43, no.6, p.1327-30 (Dec. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.6, p.905-9 (Dec. 1982).
Examines the special features of vortex flow in the vicinity of the upper critical point, and approximating dependences are obtained for the point of detachment from the data of numerical solution and experiments. (2 refs.)

101252 Shear viscosity in diatomic fluids. M.Whittle, J.H.R.Clarke (Dept. of Chem., Univ. of Manchester Inst. of Sci. & Technol., Manchester, England).
Mol. Phys. (GB), vol.49, no.5, p.1199-208 (10 Aug. 1983).
The centre of mass interaction force between a pair of homonuclear diatomic molecules is expanded as a Taylor series in the bond vectors. This leads to terms in an expression for the off-diagonal stress tensor components which explicitly involve the molecular orientations. Stress correlation functions and steady state shear viscosities obtained using the expansion to only second order compare favourably with exact molecular dynamics results for moderately anisotropic molecules such as nitrogen over a range of liquid densities. (13 refs.)

101253 Amplification of azimuthal rotation in a meridional electric vortex flow in a hemisphere. V.Boyarevich, R.Millere.
Magnetohydrodynamics (USA), vol.18, no.4, p.373-8 (Oct.-Dec. 1982). Translation of: *Magn. Gidrodin. (USSR)*, vol.18, no.4, p.51-6 (Oct.-Dec. 1982).
An axisymmetric meridional flow which converges to the symmetry axis, possesses a striking property of swirling. Even a small priming azimuthal motion results in the formation of a rapidly rotating vortex on the symmetry axis. Such vortices are usually explained by stretching of vortex tubes in the axial region or, in other words, by convection of angular momentum towards the axis, where under the condition of conservation of the momentum Ω the azimuthal velocity $v\sim\Omega/r \sin\theta$ and the angular velocity $\omega\sim\Omega/r^2 \sin^2\theta$ increase strongly as the distance $r \sin\theta$ from the axis decreases. However, the observed quasisteady state of the vortices even upon a change of Ω far from the axis is an indication of a significant effect of viscosity of maintenance of the vortex. The process of interaction of convection and viscous effects in a rotating vortex has not been studied extensively; one can cite only an idealized model which describes maintenance of the rotation of a vortex filament by a potential flow at the rear critical point. A numerical analysis is proposed in this paper of the mechanism which generates a rotating vortex in a meridional flow in a hemisphere, created by an electromagnetic force. This flow is a model of the motion of a fluid medium in electrotechnical processes. (8 refs.)

101254 A critical layer dominated by non-parallel effects in a rotating barotropic flow. L.Merkine (Div. of Engng., Brown Univ., Providence, RI, USA).
Proc. R. Soc. London Ser. A (GB), vol.388, no.1795, p.293-310 (8 Aug. 1983).
The critical layer of perturbations to slowly modulating strong rectified currents induced by vorticity sources in a quasi-geostrophic barotropic flow is investigated. For $r \gg Re^{-3/2}$ and $r \gg \delta^2$ which corresponds to realistic geophysical conditions, the critical layer is dominated by the advection of the perturbation's vorticity by the weak transverse velocity of the basic state and not by the traditional viscous or nonlinear balance. The Ekman, Rossby and Reynolds numbers of the flow are E, Ro and Re respectively and $r = E^{1/2}/Ro$, while δ is the parameter of nonlinearity. The width of the critical layer is $O(r^{1/6})$ which can be quite thick for relevant flow conditions. This suggests that non-parallel effects play an important role in the dynamics of large scale geophysical flows. (22 refs.)

101255 Study of wing vortex schemes. V.I.Men'shikov, M.M.Ovcharov.
Sov. Aeronaut. (USA), vol.25, no.2, p.93-5 (1982). Translation of: *Izv. VUZ Aviats. Tekh. (USSR)*, vol.25, no.2, p.78-9 (1982).
The problem of studying separation-free ideal incompressible fluid flow around a wing of finite aspect ratio reduces to the solution of a singular integral equation. In practice wide use has been made of an approximate method for the solution of this equation, in which the integrals are replaced by sums, which is equivalent to replacement of the vortex surface (replacing the wing) by discrete horseshoe vortexes. Calculations have shown that if one replaces a vortex surface by a comparatively small number of discrete vortexes using this scheme their intensity and the magnitudes of the coefficients c_y and m_z differ significantly from their exact values. The authors attempt to locate the discrete vortices so that the accuracy of determination of the coefficients c_y and m_z of the wing will be sufficiently high even with a small number of vortices. (2 refs.)

101256 The Taylor-Green vortex: fully developed turbulence and transition to spatial chaos. U.Frisch (Obs. de Nice, CNRS, Nice, France).
Dynamical Systems and Chaos. Proceedings of the Sitges Conference on Statistical Mechanics, Sitges, Barcelona, Spain, 5-11 Sept. 1982 (Berlin, Germany: Springer-Verlag 1983), p.257-9
A brief introduction to fully developed turbulence is given. The author then reports results obtained from numerical simulations of the Taylor-Green three dimensional vortex flow. This flow is perhaps the simplest system in which one can study the generation of small scales by three-dimensional vortex stretching and the resulting turbulence. The problem is studied by both direct spectral numerical solution of the Navier-Stokes equations (with up to 256 modes) and by power series analysis in time. (5 refs.)

47.35 WAVES

101257 Principal waves in elastic subfluids. H.Cohen, C.-C.Wang (Dept. of Civil Engng., Univ. of Manitoba, Winnipeg, Manitoba, Canada).
Arch. Ration. Mech. & Anal. (Germany), vol.83, no.2, p.139-68 (1983).
Acceleration waves in various types of elastic subfluids were studied in a recent paper by Tokuoka and Kusunoki (1982). They obtained the general forms of the propagation conditions for waves in elastic subfluids and the speeds of the principal waves. Their results led them to their remark that elastic subfluids possess both solid-like and fluid-like qualities. They neither considered amplitude equations for the principal waves nor put their conclusions into contact with similar results for waves in other types of elastic materials. The present authors close that gap by showing that results obtained by Tokuoka and Kusunoki (1982) may be derived from a general class, including both propagation conditions and amplitude equations, for waves in orthotropic materials. (5 refs.)

101258 Some observations on boundary conditions for the shallow-water equations in two space dimensions. N.A.Edwards, C.P.Please, R.W.Preston (Central Electricity Res. Labs., Leatherhead, England).
IMA J. Appl. Math. (GB), vol.30, no.2, p.161-72 (March 1983).
Discusses the specification of suitable boundary conditions to ensure the well-posedness of the linearized shallow water equations in a semi-infinite region. The authors apply Kreiss's (1970) theory which enables results to be obtained for the case of variable coefficients in a general geometry once the half-plane problem has been analysed. The entire set of possible boundary conditions consisting of linear relations between the flow variables is considered and the effects of the boundary conditions on the well-posedness of the initial-boundary-value problem are discussed. The results indicate a fundamental similarity between the cases of outflow and inflow. They also emphasize the very special nature of the case of no normal flow across the boundary. The results are compared with those which the Classical Energy Method provides for uniqueness. This comparison shows that there may be a relationship between the two methods and further illustrates the similarity between outflow and inflow. (16 refs.)

101259 Study of internal waves in the case of rapid horizontal motion of cylinders and spheres. V.A.Gorodtsov, E.V.Teodorovich.
Fluid Dyn. (USA), vol.17, no.6, p.893-8 (Nov.-Dec. 1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Zhidk. & Gaza*, vol.17, no.6, p.94-100 (Nov.-Dec. 1982).
A sphere and a cylinder are simulated by mass sources distributed over their surfaces, and expressions are obtained for the wave resistance of such sources moving horizontally in an exponentially stratified fluid. It is shown that then, in contrast to the case of simulation of such bodies by point dipoles, the paradox of an infinite wave resistance does not arise. Different variants of the method of equivalent sources are discussed. (15 refs.)

101260 Waves in a nonhomogeneous tube of variable circular section with running liquid. R.Yu.Amenzade, V.G.Nasibov.
Izv. Akad. Nauk Az. SSR Ser. Fiz.-Tekh. & Mat. Nauk (USSR), no.5, p.144-50 (1982). In Russian.
Formulation and solution of one-dimensional equations, which describe the extension of stationary waves in a long and nonfixed and nonhomogeneous elastic tube of variable circular section containing liquid, are represented. In addition, the liquid is assumed as inviscid and uncompressed. For the wave, extended in one direction, the solution of the corresponding singular boundary problem of Sturm-Liouville is reduced to the solution of the integral equation of Walter type. (10 refs.)

101261 Theoretical study of wave stream effect on flow around obstructions. A.M.Ibragimov.
Izv. Akad. Nauk Az. SSR Ser. Fiz.-Tekh. & Mat. Nauk (USSR), no.6, p.125-31 (1982). In Russian.
Describes theoretical estimations of loads induced by wave stream on randomly oriented passed obstructions. The problem was solved by applying expressions for the velocity and acceleration from the conception of the potential theory of second approach waves. Unlike previously known solutions, the author during the integration took into account the effect of wave top height by introduction into underintegrated expressions the true ordinates of points of the disturbed liquid surface z instead of ordinates of points in calm z_0, due to which more strict expressions permitting one to determine functional relationships between resultants of wave load with all process parameters are obtained. The derived expressions can be used for the calculation of wave loads on oil and gas field hydrotechnical structures, consisting of tubular stems. (8 refs.)

101262 Effects of slowly varying depth and current on the evolution of a Stokes wavepacket. F.-M.Turpin, C.Benmoussa, C.C.Mei (Dept. of Civil Engng., MIT, Cambridge, MA, USA).
J. Fluid Mech. (GB), vol.132, p.1-23 (July 1983).
The authors consider the effects of slowly varying depth and current on the evolution of a packet of Stokes waves. The lengthscale of one-dimensional depth variation is assumed to be much greater than that of the wave envelope, and the direction of the current is perpendicular to the depth contours. By the method of multiple scales, the wave envelope is found to satisfy a cubic Schrodinger equation with slowly varying coefficients. The criterion of spatial instability to small sidebands is extended. Numerical integration shows that the nonlinear evolution of a wavepacket is directly related to the instability parameter, which depends strongly on the current and depth variation. The heuristic hypothesis of Djordjevic and Redekopp (1978) on the soliton evolution over a slope in the absence of current is assessed. (16 refs.)

101263 Trapping of water waves above a round sill. Y.Renardy (Maths. Res. Center, Univ. of Wisconsin, Madison, WI, USA).
J. Fluid Mech. (GB), vol.132, p.105-18 (July 1983).
The three-dimensional problem of wave trapping above a submerged round sill was first analysed by Longuet-Higgins (1967) on the basis of a linear shallow-water theory. The large responses predicted by the theory were, however, not well borne out by the experiments of Barnard et al. (1983) and this has motivated a more detailed study of the problem. A full linear theory for both inviscid and weakly viscous fluid, without any shallow-water assumptions, is presented here. It reveals important limitations on the use of shallow-water theory and the reasons for them. In particular, while the qualitative features of wave trapping are similar to those of shallow-water theory, the nearly resonant frequencies differ significantly, and, since the resonances are narrow, the observed amplitudes at a given frequency differ greatly. The geometry is strongly indicative of long waves, and the dispersion relation appears quite consistent with that, but the part of the motion at wavenumbers that are not small has, despite the small amplitude, a substantial effect on the response to excitation. (16 refs.)

101264 Instabilities of dynamic thermocapillary liquid layers. II. Surface-wave instabilities. M.K.Smith, S.H.Davis (Dept. of Engng. Sci. & Appl. Maths., Technol. Inst., Northwestern Univ., Evanston, IL, USA).
J. Fluid Mech. (GB), vol.132, p.145-62 (July 1983).
For pt.I see ibid., vol.132, p.119-44 (1983). A planar liquid layer is bounded below by a rigid plate and above by an interface with a passive gas. A steady shear flow is set up by imposing a temperature gradient along the layer and driving the motion by thermocapillarity. This dynamic state is susceptible to surface-wave instabilities that couple the interfacial deflection to the underlying shear flow. These instabilities are found to be directly related to the two-dimensional waves on an isothermal layer subject to wind shear as described by Miles (1960) and by Smith and Davis (1983). Hence the surface-tension gradients are important only in that they drive the basic shear flow. The surface-wave stability characteristics for liquid layers with and without return-flow profiles are presented, and special attention is paid to long-wave instabilities. Comparisons are made with available experimental observations. (9 refs.)

101265 Large-scale modulations of edge waves. T.R.Akylas (Dept. of Mech. Engng., MIT, Cambridge, MA, USA).
J. Fluid Mech. (GB), vol.132, p.197-208 (July 1983).
The temporal and spatial evolution of large-scale modulations of weakly nonlinear edge waves on a uniformly sloping beach is studied using the full water-wave formulation for beach angles $\alpha = \pi/2N$. Equations governing the evolution of envelopes of edge waves, excited by resonant interactions with incident wavetrains, are derived. It is deduced that a uniform train of free periodic edge waves is always unstable to large-scale variations, so that enve-

lope solitons will develop; the resulting three-dimensional solitons are described in detail. In addition, it is shown that steady-state standing subharmonic edge waves, excited by incident wavetrains on long, mildly sloping beach, can be unstable to large-scale modulations. The possible physical significance of these findings is discussed. (18 refs.)

101266 A porous-wavemaker theory. A.T.Chwang (Inst. of Hydraulic Res., Univ. of Iowa, Iowa City, IA, USA).
J. Fluid Mech. (GB), vol.132, p.395-406 (July 1983).
A porous-wavemaker theory is developed to analyse small-amplitude surface waves on water of finite depth, produced by horizontal oscillations of a porous vertical plate. Analytical solutions in closed forms are obtained for the surface-wave profile, the hydrodynamic-pressure distribution and the total force on the wavemaker. The influence of the wave-effect parameter C and the porous-effect parameter G, both being dimensionless, on the surface waves and on the hydrodynamic pressures is discussed in detail. (12 refs.)

101267 Single waves in underground hydromechanics problems. A.Kh.Mirzadzhanzade, Z.P.Shul'man, A.O.Bogopol'skii (M. Azizbekov, Inst. of Oil & Chem., Baku, Azerbaidzhan SSR).
J. Eng. Phys. (USA), vol.43, no.6, p.1407-13 (Dec. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.6, p.999-1006 (Dec. 1982).
Models of single filtration waves, which can be used in problems of intensification of the development and investigation of oil-gas strata, are considered. (3 refs.)

101268 Excitation of finite-amplitude waves on the surface of a perfectly conducting liquid by a varying magnetic field. A.V.Nesterov.
Magnetohydrodynamics (USA), vol.18, no.4, p.384-8 (Oct.-Dec. 1982). Translation of: *Magn. Gidrodin. (USSR)*, vol.18, no.4, p.64-8 (Oct.-Dec. 1982).
The author considers the interaction of a varying magnetic field with surface waves in an ideal perfectly conducting liquid. A parametric resonance effect, with the amplitude of surface waves increasing exponentially with time, is possible for certain relations between the wave and field frequencies in the system. Account of nonlinear effects makes it possible to find the amplitude of stationary standing waves. (7 refs.)

101269 Bifurcating instability of the free surface of a ferrofluid. E.E.Twombly (NHC Wind Engng., Kent, WA, USA), J.W.Thomas.
SIAM J. Math. Anal. (USA), vol.14, no.4, p.736-66 (July 1983).
Considers a slab of ferrofluid bounded below by a fixed boundary and above by a vacuum. If the fluid is subjected to a vertically directed magnetic field of sufficient strength, surface waves appear. The equations which describe this phenomenon are derived. In the physical space no natural Banach space structure is available due to the free surface. In order to use the available bifurcation theory, a transformation of coordinates is made, mapping the surface flat. In the new coordinate system the equations define an operator between Banach spaces. The minimum eigenvalue of the linearized operator is the critial magnetic field strength where the planar surface loses stability. Using a generalized inverse of the Frechet derivative of the operator and the implicit function theorem, the existence of a nontrivial branch of solutions is proved. A local stability criterion is also obtained and applied to three periodic structures: rolls, squares and hexagons. (22 refs.)

101270 A variation of MacCormack's method for axisymmetric viscous compressible flows. J.F.Stalnaker (Lockheed-Huntsville Res. & Engng. Center, Huntsville, AL, USA).
AIAA J. (USA), vol.21, no.7, p.1043-4 (July 1983).
Recent advances in computational fluid dynamics and computer technology have made possible the solution of complicated three-dimensional flowfields. Still, if the symmetry of the problem permits, the use of the axisymmetric approximation provides considerable computational economy and greater resolution. If the flowfield in the vicinity of the axis is to be calculated, great care must be taken in choosing a finite difference scheme which properly models the axisymmetric form of the governing equations. The author presents such a finite difference scheme which maintains all the desirable characteristics of MacCormack's highly successful explicit technique. (4 refs.)

47.40D General subsonic flows

101271 Edge tones in high-speed flows and their application to multiple-jet mixing. A.Krothapalli, K.Karamcheti, Y.Hsia, D.Baganoff (Joint Inst. for Aeronautics & Acoustics, Stanford Univ., Stanford, CA, USA).
AIAA J. (USA), vol.21, no.7, p.937-8 (July 1983).
Reports the results of an experimental investigation on edge tones generated with a high-speed subsonic air jet issuing from a rectangular nozzle and impinging on a wedge shaped edge. Experiments were also made to determine the influence of these tones on the mixing of multiple rectangular jets. For exit Mach numbers ranging from 0.2 to 1.0, the minimum breadth required for a tone to be generated increases linearly with Mach number. At distances of the wedge beyond the minimum breadth, the narrow-band spectrum of the near field pressure signals indicate the simultaneous existence of several discrete frequencies, and the amplitude dominant frequencies show different stages. Improved mixing of the multiple jets has been observed when a wedge is placed in one of them. (3 refs.)

101272 Similar solutions of the compressible boundary layer on a spinning cylinder in axial flow. R.Leblanc (Lab. d'Aerodynamique, ENSMA, Poitiers, France).
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.15, p.1113-18 (25 April 1983). In French.
Falkner-Skan type equations are established for the compressible boundary layer on a spinning cylinder in axial flow. The ω-first-order development of the f and g functions lead to the perturbation velocity profiles. The major effects of the rotation is firstly to delay the separation and secondly to generate an over speed for the longitudinal accelerated profiles. (4 refs.)

101273 Unicity of the polynomial representation of the integral quantities of a compressible boundary layer on a spinning cylinder in axial flow. R.Leblanc (Lab. d'Aerodynamique, ENSMA, Poitiers, France).
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.16, p.1207-12 (2 May 1983). In French.
The similar velocity profiles of the compressible boundary layer on a spinning cylinder in axial flow are used to establish the polynomials of the integral quantities. It is shown that the linear relation between the pressure gradient parameter β and the spinning velocity ω for $\beta \simeq 0$, which lead to the same velocity profile, can be generalized. The unicity of the polynomials is then established. (3 refs.)

101274 Configuration of subsonic regions formed by supersonic flow past a cylinder with spherical nose at large angles of attack. V.B.Minostsev, K.G.Savinov.
Fluid Dyn. (USA), vol.17, no.6, p.959-61 (Nov.-Dec. 1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Zhidk. & Gaza*, vol.17, no.6, p.174-6 (Nov.-Dec. 1982).
As has been shown by investigations of supersonic flow at large angles of attack past a cylinder with spherical nose, one can distinguish five types of flow in the shock layer on the basis of the configuration of the subsonic regions. In a large range of angles of attack, beginning with zero angle of attack, there is a flow for which the subsonic region is situated only near the nose; this is the first flow type. As the angle of attack is increased, a restricted local subsonic region attached to the surface of the cylinder appears; this is the second flow type. The third flow type is observed at even larger angles of attack, when the subsonic region on the cylinder extends to infinity. With further increase in the angle of attack, the subsonic region attached to the cylinder is joined to the main subsonic region at the nose, which gives the fourth flow type. Finally, at angles of attack near 90°, the flow on the windward side is subsonic everywhere in the shock layer. The authors have calculated the flow on the windward side in the presence of local or extended subsonic regions on the side surface. (3 refs.)

101275 Approximate solution of the problem of sonic flow around a flat-bottom profile. S.K.Aslanov.
Sov. Aeronaut. (USA), vol.25, no.2, p.6-11 (1982). Translation of: *Izv. VUZ Aviats. Tekh. (USSR)*, vol.25, no.2, p.8-12 (1982).
The author constructs the approximate field of sonic flow around a flat-bottom profile at small angle of attack. The solution of the singular problem has simple algebraic form, regular nature of the singularity and branching, satisfies exactly the conditions of flow over the lower part of the wing, agrees very well with the known exact solution in both the near and far zones of the profile, and leads to a closed formula for the pressure distribution on the profile. 47.40H Transonic flows

101276 Analysis of viscous-inviscid interaction in transonic internal flows. Meng-Sing Liou (McDonnell Douglas Corp., St. Louis, MO, USA).
AIAA J. (USA), vol.21, no.7, p.962-9 (July 1983).
A method is presented to compute steady transonic flows in two-dimensional and annular diffusers, including the effects of shock/turbulent boundary-layer interaction and mass transfer through permeable walls. The analysis is based on the technique of matched asymptotic expansions and results in a system of coupled equations that describes the inviscid and turbulent boundary-layer flows. The derivation allows for the possibility of shock-induced separation in case of sufficiently strong shocks, assuming the separation bubble size is comparable to the boundary-layer thickness. The numerical procedure required to solve the system of equations is simple, and the computation times are sufficiently short to be useful in engineering design. Results are illustrated for two-dimensional and axisymmetric cases, the former showing good agreement with available experimental data. (21 refs.)

101277 Three-dimensional flow studies on a slotted transonic wind tunnel wall. J.M.Wu, F.G.Collins, M.K.Bhat (Univ. of Tennessee Space Inst., Tullahoma, TN, USA).
AIAA J. (USA), vol.21, no.7, p.999-1005 (July 1983).
Three-dimensional flowfield measurements were made near a transonic slotted wall. Field velocity vectors and static pressure distributions have been obtained. The boundary-layer displacement thickness was found to vary in the transverse plane with its maximum at the slot centerline but decreased with increasing suction rate through the slot. The boundary-layer characteristics were sensitive to the mass transfer through the slot. The projection of the flowfield velocity vectors on the transverse plane revealed a vortex-like flow formation. The center of this secondary flow was located nearly at the edge of the wall shear layer and decreased in strength with applied suction. The secondary vortex motion may be attributed to the mean flow skewing, inhomogeneous transverse plane boundary layer, and the wall turbulence anisotropy. These sources produced rotation of opposite sense and their contributions varied with the suction rate. (19 refs.)

101278 Calculation of three-dimensional transonic gas flow through a stage of an axial turbine. V.I.Gnesin.
Fluid Dyn. (USA), vol.17, no.6, p.927-34 (Nov.-Dec. 1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Zhidk. & Gaza*, vol.17, no.6, p.138-46 (Nov.-Dec. 1982).
The authors describe the formulation of the problem and a numerical method of calculating the three-dimensional flow of an ideal gas in a turbomachine stage with allowance for the aerodynamic interaction of the directing apparatus and the working rotor, which are in relative motion. The idea of the method is to use the principle of stabilisation in the solution of the complete

system of nonstationary three-dimensional equations of motion of a compressible gas through a system of aerodynamically interacting cascades. (16 refs.)

101279 Nonlinear far field in the case of transonic flow past a nonlifting profile. G.D.Sevost'yanov.
Fluid Dyn. (USA), vol.17, no.6, p.957-9 (Nov.-Dec. 1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Zhidk. & Gaza*, vol.17, no.6, p.171-3 (Nov.-Dec. 1982).
A new analytic solution is constructed for the nonlinear transonic equations describing the irrotational far flow field (with two symmetry axes) in the case of transonic flow past a nonlifting profile. With increasing distance from the profile, the nonlinear field goes over continuously into the field of the linear theory. The solution is expressed in terms of an elliptic Weierstrass function. 47.40K Supersonic and hypersonic flows

101280 Effects of properties and location in the plume on droplet diameter for injection in a supersonic stream. A.S.Nejad, J.A.Schetz (Virginia Polytech. Inst. & State Univ., Blacksburg, VA, USA).
AIAA J. (USA), vol.21, no.7, p.956-61 (July 1983).
The mean droplet diameter in the spray resulting from transverse injection of liquid jets into supersonic airstream was investigated in detail by the use of diffractively scattered light method. The effects of viscosity, surface tension, jet/freestream dynamic pressure ratio, injector diameter, and location in the plume on the mean droplet diameter were determined. All tests were performed at $M_\infty=3.0$, with $P_0=4.2$ atm and $T_0=300$K. The injectants used were water, various solutions of glycerine and ethanol in water, and Fluorinert to produce wide variations in viscosity and surface tension. (18 refs.)

101281 Study of the aerodynamic characteristics of a diamond profile in translational oscillations in supersonic flow. A.N.Varnavskii.
Sov. Aeronaut. (USA), vol.25, no.2, p.56-7 (1982). Translation of: *Izv. VUZ Aviats. Tekh. (USSR)*, vol.25, no.2, p.51-2 (1982).
The author presents the results of a study of the influence of translational oscillations of a diamond profile in supersonic flow on the aerodynamic characteristics, obtained with the aid of the gashydraulic analogy method. He examines oscillations in the range of dimensionless oscillation frequencies p^* from 0 to 1.0 and relative amplitudes $y=0.008$, 0.02, 0.04 with incidence angle $\alpha_0=0°$. The diamond profile apex halfangle was $\theta=10°$ and the chord was $b=250$ mm. (4 refs.)

47.40N Shock-wave interactions

101282 A self-similar flow behind a spherical shock wave with thermal radiation. I. J.B.Singh, P.R.Vishwakarma (Dept. of Maths., SGR Postgraduate Coll., Dobhi, Jaunpur, India).
Astrophys. & Space Sci. (Netherlands), vol.93, no.2, p.261-5 (June 1983).
Similarity solutions, for one-dimensional unsteady flow of a perfect gas behind a spherical shock wave produced on account of a sudden explosion or driven out by an expanding piston including the effects of radiative cooling, are investigated. The shock ahead of the point of explosion or piston is propagating into a transparent medium at rest with nonuniform density. The total energy of the wave is assumed to be time dependent obeying a power law. (8 refs.)

101283 Interaction of oblique shock and detonation waves. Y.Sheng, J.P.Sislian (Univ. of Toronto, Toronto, Ontario, Canada).
AIAA J. (USA), vol.21, no.7, p.1008-14 (July 1983).
The interaction of an oblique shock wave and an oblique detonation wave which deflect the flow in the same direction is analyzed. The detonation wave is assumed to be an exothermic gasdynamic discontinuity. A criterion is developed and used to determine whether or not a theoretical solution of the problem describes a physically realizable interaction configuration. It is found that the reflected wave is a rarefaction wave; however, if the heat release parameter of the detonation wave is sufficiently small, then the reflected wave can be a shock wave. Domains of existence of such resulting wave interaction configurations are established for different values of the oncoming Mach number, $6\leq M\leq 8$, the heat release parameter, $3\leq Q\leq 8$, and the specific heat ratios for the combustion products behind the detonation wave, $1.30<\gamma\leq 1.33$. (9 refs.)

101284 Problems with a direct simulation Monte Carlo method applied to the shock structure in a binary gas mixture. B.Schmidt, M.Worner (Inst. fur Stromungslehre und Stromungsmaschinen, Univ. Karlsruhe, Karlsruhe, Germany).
Arch. Mech. (Poland), vol.34, no.3, p.325-31 (1982).
The direct simulation Monte Carlo method as developed by G.A. Bird (1976) gives results independent of the number of molecules per cell for the shock structure in binary gas mixtures if the number of molecules per cell is sufficiently large. Up to a certain number, separation of the components, shock thickness and the temperature relaxation downstream of the shock are dependent on the number of molecules per cell. Two facts are responsible for the observed distortions of the computed results: the calculation procedure for the molecule collisions and the small perturbation propagation speed across a simulation cell. (8 refs.)

101285 Decay of a plane shock wave in a two-parameter medium with arbitrary equation of state. S.A.Egorushkin.
Fluid Dyn. (USA), vol.17, no.6, p.935-40 (Nov.-Dec. 1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Zhidk. & Gaza*, vol.17, no.6, p.147-53 (Nov.-Dec. 1982).
Special curves, called shock polars, are frequently used to determine the state of the gas behind an oblique shock wave from known parameters of the oncoming flow. For the solution of problems associated with gas flow at high velocities and high temperatures it is necessary to use models of gases with complicated equations of state. A study is made of the form of the shock polars for two-parameter media with arbitrary equation of state, these satisfying the conditions of Cemplen's theorem. Some properties of oblique shocks in such media that are new compared with a perfect gas are established. On the basis of the obtained results, the existence of triple configurations in steady supersonic flows obtained by the decay of plane shock waves is considered. It is shown that D'yakov-unstable discontinuities decompose into an oblique shock and a centered rarefaction wave while spontaneously radiating discontinuities decompose into two shocks or into a shock and a rarefaction wave. (5 refs.)

101286 Shock wave structure in a monatomic gas in the case of power-law interaction potentials. V.V.Aristov, F.G.Cheremisin.
Fluid Dyn. (USA), vol.17, no.6, p.964-8 (Nov.-Dec. 1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Zhidk. & Gaza*, vol.17, no.6, p.179-83 (Nov.-Dec. 1982).
The structure of a plane shock wave is the simplest example of a nonequilibrium state of a gas. The flow is one dimensional and there are no effects of interaction of the gas with the surface of a solid body. The authors investigate the shock wave structure on the basis of a conservative method of decoupling which makes it possible to raise the accuracy of the calculation compared with the methods previously used to solve the Boltzmann equation. Numerical results are given for the hard-sphere molecular model and power-law potentials with exponent corresponding to previous experiments. (14 refs.)

101287 Shock diffraction in channels with 90° bends. D.H.Edwards (Dept. of Phys., Univ. Coll. of Wales, Aberystwyth, Wales), P.Fearnley, M.A.Nettleton.
J. Fluid Mech. (GB), vol.132, p.257-70 (July 1983).
A study has been made of how initially planar shocks in air propagate around 90° bends in channels of nearly rectangular cross-section. In shallow bends for which the radius of curvature R is much greater than the radius r of the channel, the shock recovers from a highly curved profile at the start of the bend to regain planarity towards the end of the bend. This occurs on account of the acceleration of the triple point across the channel following its interaction with the expansion waves generated at the convex wall. In sharp bends the shock profiles retain their pronounced curvature for some distance downstream of the bend. (16 refs.)

47.45 RAREFIED GAS DYNAMICS

(see also 07.30 Vacuum production and techniques)

101288 Cylindrical Couette problem of rarefied binary mixture. Dang Hong Tiem (Univ. Paris-6, Paris, France).
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.14, p.1015-18 (18 April 1983). In French.
The flow of a rarefied binary mixture between two coaxial cylinders is analysed by the moment method of Lees. It is found that, in the case where one cylinder rotates while the other is fixed, the heavier gas follows the rotating cylinder by throwing out the lighter to the other cylinder. (3 refs.)

47.50 NON-NEWTONIAN DYNAMICS

101289 Laminar entry length problem for power law fluids. Z.Matras, Z.Nowak (Tech. Univ. of Krakow, Kracow, Poland).
Acta Mech. (Austria), vol.48, no.1-2, p.81-90 (1983).
The authors present a new approximate method for predicting the changes in pressure drop in laminar entrance region flow of purely viscous power law fluids in circular tubes. The 'transformation method for describing the tube flow of non-Newtonian purely viscous fluids' has been extended and adopted to construct a pseudo-Newtonian model of the flow under consideration. To derive the dimensionless equations for calculating the changes in pressure drop in the entrance region flow and the velocity distribution in both the developing boundary layer and inside the inviscid core the momentum integral method has been applied. The analysis leads to only one single curve correlation—independent of any value of flow behaviour index—between the pressure drop and the axial distance from the tube entrance which is presented in a form suitable for engineering designs. (16 refs.)

101290 Flow of a non-Newtonian fluid in a convergent channel in a transverse magnetic field. M.A.Khidr, F.M.Hady (Dept. of Math., Assiut Univ., Assiut, Egypt).
Acta Phys. Pol. A (Poland), vol.A64, no.1, p.3-7 (July 1983).
The boundary-layer flow of a non-Newtonian fluid in a convergent channel in a transverse magnetic field is considered. A perturbation method to derive equations up to the first order is used, and numerical results are given. (4 refs.)

101291 Turbulent flow with polymer additives. B.Gampert, P.Wagner (Univ. of Essen, Essen, Germany).
Arch. Mech. (Poland), vol.34, no.4, p.493-502 (1982).
For a better understanding of the Toms phenomenon it is necessary to correlate molecular characteristics with the turbulent drag reduction effect. Experimental results concerned with the effect of molecular weight on drag reduction and mechanical degradation in turbulent fully-developed pipe flow are presented. The polymeric material investigated was very clean laboratory synthesized polyacrylamide. (7 refs.)

101292 Experimental study of velocity and scalar fields in grid-generated turbulence with dilute polymer solutions. A.Bennani, J.Mathieu (Ecole Centrale de Lyon, Ecully, France).
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.16, p.1213-16 (2 May 1983). In French.
Measurements of some of the properties of velocity and scalar fields are made in grid generated turbulence for one concentration of a drag-reducing polymer additive in water (2.000×10^{-6} of polyacrylamide). The passive scalar used is a solution containing salt (NaCl) injected into flow water through the grid. A comparison was made between water and an aqueous solution of polyacrylamide. In particular, the decay of turbulence intensity and fluctuation concentra-

tion intensity of salt downstream from the grid are more rapid in the flow polymer solution. (10 refs.)

101293 Drag minimization on a body of revolution through evolution. W.E.Pinebrook, C.Dalton (Univ. of Houston, Houston, TX, USA).
Comput. Methods Appl. Mech. & Eng. (Netherlands), vol.39, no.2, p.179-97 (Aug. 1983).
This study deals with the determination of the minimum drage profile of a body of revolution. With the restriction that the boundary layer is not allowed to separate, the profile is described by a continuous, linear line-singularity distribution defined at a number of points placed parallel in a uniform stream with zero angle of attack. The drag calculation is based on the momentum deficit in the boundary layer at the trailing edge of the body. By gradually changing the body profile with the Evolution Strategy the minimum drag profile is found for a constant fineness ratio. For a particular case, the drag coefficient is reduced by 30 percent by means of this procedure. (25 refs.)

101294 Flow of a second-order fluid under torsionally oscillating disc. H.G.Sharma, D.S.Gupta (Dept. of Math., Univ. of Roorkee, Roorkee, India).
Indian J. Pure & Appl. Math., vol.14, no.6, p.728-34 (June 1983).
The flow of an incompressible second-order fluid under an infinite torsionally oscillating disc has been considered by expanding the velocity components and the pressure in powers of amplitude of oscillation (assumed small) of the disc. The transverse and the radial flows are investigated in detail. The effects of second-order forces is to increase the amplitude of the oscillation of the axial velocity. The steady parts of the velocity components for small values of Reynolds number have been studied and shown graphically. The transverse shearing stress and moment on the discs have also been obtained. (4 refs.)

101295 Application of nonlinear operator theory to the Edwards-Freed equations in the theory of polymer solutions. T.Yoshimura.
J. Math. Phys. (USA), vol.24, no.8, p.2056-60 (Aug. 1983).
Mathematical structure of nonlinear integral equations for 'screened hydrodynamic interaction' and 'self-energy' in the static version of Edwards and Freed's theory of polymer solutions with finite concentrations are analyzed and it is shown that algorithms developed by Lika (1975) and Altman (1977, 1980) for nonlinear operator equations without Frechet differentiability are applicable. Recipes for successive approximations are presented and questions to be investigated by those techniques are proposed. (14 refs.)

101296 Geometrical approach for the study of non-Newtonian fluid flows. A.Ramachandra Rao, A.V.Gopalakrishna (Dept. of Appl. Math., Indian Inst. of Sci., Bangalore, India).
J. Math. & Phys. Sci. (India), vol.17, no.1, p.87-93 (Feb. 1983). [received: Aug. 1983]
The geometry of vortex lines has been used to study the flow of an incompressible viscoelastic fluid. The intrinsic equations governing the flow have been derived and the conditions for the Bernoulli surfaces to contain the vortex lines have been obtained for a suitably defined Bernoulli function. 47.55C Jets

101297 Investigation of two plane parallel jets. H.Elbanna, S.Gahin (King Abdulaziz Univ., Jeddah, Saudi Arabia), M.I.I.Rashed.
AIAA J. (USA), vol.21, no.7, p.986-91 (July 1983).
Results of an experimental study on the interaction of two two-dimensional turbulent parallel jets are reported. The investigation includes measurements of mean velocity, turbulence intensities, and Reynolds shear stress. The structure of the combined flow is compared with that of a single jet. The results show that the velocity profiles of the combined flow are similar and agree well with that of the single jet. Up to 120 slot widths downstream from the nozzles, true similarity is not found. For a spacing of 12.5 slot widths between the axes of the two nozzles, the half-width of the combined flow grows linearly with downstream distance, but its spread angle is slightly lower than that of a single jet. The centerline velocity decays with the same rate as the single jet, but with a higher value of U_M/U_0. (13 refs.)

101298 Penetration and breakup of slurry jets in a supersonic stream. D.M.Less, J.A.Schetz (Virginia Polytech. Inst. & State Univ., Blacksburg, VA, USA).
AIAA J. (USA), vol.21, no.7, p.1045-6 (July 1983).
By adding metal powders to liquid fuels, the energy of the fuels can be greatly increased. Ramjets that burn slurry fuels can be compact and yet possess high specific thrust, high speed, and high continuous thrust. The study was directed toward examining the penetration and breakup behavior of transverse slurry jets. The suspended particles had an average diameter of 5 μm, which corresponds to the size of metal particles used in earlier NACA combustion studies (1-5 μm). (no refs.)

101299 An investigation of the Mach disc and the Riemann wave formation in impulse jets. V.V.Golub, I.M.Naboko (Inst. of High Temperatures, Acad. of Sci., Moscow, USSR).
Arch. Mech. (Poland), vol.34, no.4, p.465-75 (1982).
The shock waves in nonstationary jets of shock-heated n_2, Ar and CO_2 outflowing from flat and axisymmetrical sonic nozzles have been studied experimentally. The pressure range $N=P_{00}/P_\infty=20\div200$ was investigated. Here P_{00} is the pressure behind the reflected shock wave, P_∞ is the pressure in the vacuum chamber. Schlieren photographs for the nonstationary jet structure were obtained for different spatial orientations of the flat nozzle using a schlieren installation and a spark light source. On the basis of the obtained schlieren photographs of jet formation, the nonstationary wave structure of flow was reproduced. The geometrical characteristics of the nonstationary Reimann wave for three nozzles and different values of n were generalized in dimensionless similarity parameters. A dependence between the location of the Mach disc and time was obtained upto the stationary location. Moreover, a comparison with the calculation was also made. An analysis was performed for the acceptance of the model of a suddenly introduced source to the studied flow. (13 refs.)

101300 A study of concentration field of a round jet by a quantitative visualization method. J.-L.Balint, J.-M.Molines, M.Ayrault, J.-P.Schon, J.Mathieu (Univ. de Saint-Etienne, Lyon, France).
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.14, p.1011-14 (18 April 1983). In French.
A quantitative flow visualisation technique employing an association of laser sweeping and image processing has been used to determine RMS values of the concentration fluctuation in a symmetry plane of a round jet. (2 refs.)

101301 Influence of acoustics and the flow regime in the boundary layer on nozzle walls on the mixing layer of an immersed jet. A.A.Pavel'ev, V.I.Tsyganok.
Fluid Dyn. (USA), vol.17, no.6, p.844-50 (Nov.-Dec. 1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Zhidk. & Gaza*, vol.17, no.6, p.36-42 (Nov.-Dec. 1982).
Experimental determinations were made of the width of the mixing layer and the level of turbulent pulsations in the initial section of a subsonic circular immersed jet for different parameters of the boundary layer on the nozzle walls and in the presence of acoustic excitation. It was established that the rate of expansion of the turbulent mixing layer depends on the flow regime in the boundary layer. For laminar initial boundary layer, external acoustic excitation can lead to a decrease in the expansion velocity of the mixing layer and of the intensity of the velocity pulsations on the jet axis within the initial section. If the frequency and amplitude of acoustic excitation at which a decrease in the rate of expansion of the mixing layer and of the pulsation intensity was observed remained unchanged, the influence of the acoustics disappeared when the boundary layer became turbulent. The acoustic vibrations influenced the subsonic jets by generating vortex perturbations when they interact with the edge of the nozzle. (10 refs.)

101302 Jet flow of ideal fluid past a flexible shell. V.P.Zhitnikov, A.G.Terent'ev.
Fluid Dyn. (USA), vol.17, no.6, p.850-5 (Nov.-Dec. 1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Zhidk. & Gaza*, vol.17, no.6, p.43-8 (Nov.-Dec. 1982).
A detailed study is made of Kirchhoff flow of an ideal, incompressible, and weightless fluid past a flexible shell with one or two fixed points. It is shown numerically that when the pressure is decreased in a soft balloon multisheeted flows and a wavelike deformation of the balloon are possible. (7 refs.)

101303 Instabilities in the slit-jet flow field. J.F.Foss, D.Korschelt (Dept. of Mech. Engng., Michigan State Univ., East Lansing, MI, USA).
J. Fluid Mech. (GB), vol.132, p.79-86 (July 1983).
Three modes of instabilities in the slit-jet flow field are recognized. Additional evidence for the universality of the Strouhal number for the second mode $S_T=fw/U_0\approx0.43$ and additional information on the wavelength (λ) between, and convection speed u_c of the symmetrically placed, large-scale motions that result from this instability are presented. Specifically $\lambda/w\approx1.2$ and $u_c/U_0\approx0.51$. The third instability mode is initiated at a Reynolds number U_0w/ν of approximately 1600; this instability results in a loss of the regular pattern associated with the large-scale motions. (7 refs.)

101304 Discharge of a turbulent jet in a monodisperse fluidized bed. N.N.Prokhorenko, Yu.I.Chernyaev (All-Union Sci.-Res. & Planning-Design Inst. for Assembly & Processing Lines, Moscow, USSR).
J. Eng. Phys. (USA), vol.43, no.6, p.1334-9 (Dec. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.6, p.913-18 (Dec. 1982).
The velocity of initial circulation is calculated and explanations are given for the mechanism of jet collapse and the existence of bubble and jet regimes. (11 refs.)

101305 Stability of a system of current-carrying jets with currents alternating in direction. E.V.Poklonskii, A.I.El'kin.
Magnetohydrodynamics (USA), vol.18, no.4, p.362-8 (Oct.-Dec. 1982). Translation of: *Magn. Gidrodin. (USSR)*, vol.18, no.4, p.39-45 (Oct.-Dec. 1982).
The authors examine the stability of a system consisting of an infinite number of rectangular free jets arranged periodically along the z coordinate, through which flow constant electric currents directed such that the currents in adjacent jets have a different direction. Such a system can perform functions of a liquid magnet, creating a magnetic field periodic along z. Instability of the kink type is possible in such a system. It is of practical interest to examine the stability of a system of jets in which their cross section is greatly extended in the direction of the y axis, i.e. $\Delta_1/\delta_0>1$. The authors note that in this case the rectangular sections of the jet cannot be replaced by strips oriented in the y direction, since then the kinks will not lead to intensification of the magnetic field and, consequently, to the development of instability. At the same time, in the case of sufficiently large currents the geometry under consideration can also prove to be unstable. (2 refs.)

101306 Interaction of a system of jets impinging on a plane barrier. V.V.Startsev, N.I.Syromyatnikov, A.M.Poletaev.
Sov. Aeronaut. (USA), vol.25, no.2, p.106-8 (1982). Translation of: *Izv. VUZ Aviats. Tekh. (USSR)*, vol.25, no.2, p.86-8 (1982).
There is interest in studying the development of flow and heat transfer in a system of jets impinging on a barrier. A characteristic feature of the flow is the appearance of a region of interaction of the spreading jets near the surface, characterized by intense vortical motion and determining the hydrodynamics and heat exchange on the surface, and also the nature of the flow directed away from the surface. Therefore detailed study of the flow in the interaction region of spreading jets near a surface is a very important problem. The authors propose a possible approach to description of the flow in this quite complex region with the aid of a two-dimensional rectilinear vortex filament model. (4 refs.)

101307 An experimental investigation of merging buoyant jets in a crossflow. M.Gregoric (Inst. Jozef Stefan, Ljubljana, Yugoslavia), L.R.Davis, D.J.Bushnell.
Trans. ASME. J. Heat Transfer (USA), vol.104, no.2, p.236-40 (May 1982).
Merging buoyant jets discharged in a crossflow were investigated experimentally using a unique visualization technique. Salt water jets were discharged from a constant head tank while being towed in an inverted position at desired rates through stagnant receiving water. Visualization of the jet cross section was produced by using fluorescent dye and a vertical slit light source. The results were photographed as a sequence of instantaneous cross sections taken by a motor-driven camera. Maximum heights, widths, and the vertical cross sections of the deflected jets were determined for different ratios of crossflow velocity to discharge velocity, number of discharge jets and discharge nozzle line orientation. Horseshoe shaped cross sections were observed in the cases of a single jet and multiple jets where the crossflow velocity was parallel to the line of discharge ports, but the horseshoe pattern was not clear when the cross flow was perpendicular to the line of multiple jets. The wake behind the multiple jets in the crossflow exhibited a distinct trailing vortex sheet. (17 refs.)

101308 Hydrodynamics of a subsonic vapor jet in subcooled liquid. M.E.Simpson, C.K.Chan (Dept. of Chem., Nuclear & Thermal Engng., Univ. of California, Los Angeles, CA, USA).
Trans. ASME. J. Heat Transfer (USA), vol.104, no.2, p.271-8 (May 1982).
Small scale experiments were performed to investigate the condensation process and hydrodynamic pressure oscillations when steam was discharged into a subcooled water pool. The dynamic behavior of subsonic jets, differed from that of sonic jets. The interfacial motion of a subsonic jet was periodic, composed by three intervals: bubble growth, bubble translation, and bubble separation (necking). The condensation rate for each interval was governed by different processes. The pressure transient of the subsonic jet was marked by periodic impulses, originated by the necking process. Of the intensive parameters studied, pool subcooling exhibited the largest influence on dynamic behavior. The pulse frequency and intensity were found to be best fit by correlations involving the Jacob number and the Reynolds number. (16 refs.)

101309 The KdV equation in stratified fluid flow. A.Jeffrey (Dept. of Engng. Math., Univ. of Newcastle upon Tyne, Newcastle upon Tyne, England).
Appl. Anal. (GB), vol.15, no.1-4, p.283-94 (1983).
The author describes a method for the formal derivation of the equation governing long waves on the surface of a shallow fluid which is stably and continuously stratified. By using a three variable expansion procedure involving the normal time scale together with two slow time scales suggested as a result of the formulation of the problem, the governing equation is shown to be the ordinary Korteweg-de Vries equation. 47.55K Multiphase flows

101310 On a relaxing model for the flow of a mixture of gas with porous particles. F.Feuillebois, A.Lasek (Lab. d'Aerothermique, CNRS, Meudon, France).
Arch. Mech. (Poland), vol.34, no.3, p.253-62 (1982).
A suspension of solid porous particles in a perfect gas is considered. The gas penetrates into the particles and its quantity contained in the pores may vary with the flow conditions. It is assumed that the flow within the particles obeys Darcy's law. The pressure of the gas in the particle pores does not follow immediately the outer conditions, and relaxation phenomena in the flow are taken into account. One-dimensional analysis has been applied to the case of a shock wave in the considered suspension. (5 refs.)

101311 An unsteady Faxen's relation for the force including interaction effects (two-phase flow). I.Pienkowska (Inst. of Fundamental Technol. Res., Polish Acad. of Sci., Warsaw, Poland).
Arch. Mech. (Poland), vol.34, no.3, p.297-307 (1982).
Deals with unsteady hydrodynamic interactions between N spherical particles, immersed in an incompressible, unbounded fluid. It is assumed that the flow is governed by the unsteady Stokes equations. The integral equation approach, involving the Green function, depending explicitly on the time variable is used. The unsteady hydrodynamic drag, exerted on the j-th spherical particle in the presence of $N-1$ other particles, is calculated under some simplifying assumptions. (10 refs.)

101312 On the motion of gas bubbles in a perfect fluid. L.van Wijngaarden (Twente Technol. Univ., Enschede, Netherlands).
Arch. Mech. (Poland), vol.34, no.3, p.343-9 (1982).
Various forms have been proposed for the dynamic equation governing the relative motion of a body in a nonuniformly flowing liquid. The correct form is suggested by the recent work of Landweber and Miloh (1980). An alternative derivation of their result, avoiding an alleged error, is given. An application, restricted to the representation by dipoles only, is made to the nonsteady flow of bubbles through a widening pipe. (9 refs.)

101313 Heat and mass transfer by condensation in an incompressible turbulent boundary layer on a flat plate with low level exchange. Gia Ban Diep (Lab. d'Aerothermique, CNRS, Meudon, France).
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.15, p.1143-6 (25 April 1983). In French.
An investigation was made in order to find the increase of heat transfer rate on a horizontal flat plate located in a low speed mixed air-water stream at saturated conditions; under a thermal gradient, a fully turbulent boundary layer produces vapor condensation by phase change and releases latent heat. A comparison of experimental results obtained from wind tunnel measurements with computed values shows good agreement when the temperature profile is in the asymptotic case. The best exchange is for the largest free stream temperature and for largest differences in temperature from the wall. (4 refs.)

101314 Pressure oscillations in bubble columns. J.Gluszek, R.Marcinkowski (Inst. of Chem. Engng., Tech. Univ. of Warsaw, Warsaw, Poland).
Chem. Eng. J. (Switzerland), vol.26, no.3, p.181-7 (June 1983).
Spontaneous pressure oscillations have been studied theoretically and experimentally. The authors have formulated a hypothesis concerning the oscillation mechanism and worked out a mathematical model that enables calculation of oscillation frequency for a system comprised of a bubble column, sieve plate and gas chamber representing the pneumatic capacity underneath the plate. The model has been verified experimentally. (12 refs.)

101315 Generalized boundary conditions for the axial dispersion model. E.B.Nauman, R.Mallikarjun (Dept. of Chem. Engng. & Environmental Engng., Rensselaer Polytech. Inst., Troy, NY, USA).
Chem. Eng. J. (Switzerland), vol.26, no.3, p.231-7 (June 1983).
The Danckwerts boundary conditions for the axial dispersion model predict concentration profiles which are unrealistic when the dispersion coefficient is determined mainly by convection rather than by diffusion. Modified boundary conditions have been suggested as a simple means of overcoming this limitation. These are explored in a systematic way which introduces two new adjustable parameters in the model. Time-domain and Laplace-domain solutions for the residence time distribution are given. The new parameters can be found from inert tracer experiments just as the Peclet number is found. Differences between the modified model and the standard model exist for axial Peclet numbers less than 16. (9 refs.)

101316 Analogy of motion of two-phase medium containing an incompressible phase, with gas motion. V.O.Vakhnenko, V.M.Kudinov, B.I.Palamarchuk.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.6, p.21-2 (1983). In Ukrainian.
A coordinate system is found where the motion of a two-phase mixture with an arbitrary content of an incompressible phase is similar to gas motion. (6 refs.)

101317 A calculation procedure for two phase flow distribution in manifolds with and without heat transfer. A.B.Datta, A.K.Majumdar (Central Mech. Engng. Res. Inst., Durgapur, India).
Int. J. Heat & Mass Transfer (GB), vol.26, no.9, p.1321-8 (Sept. 1983).
A finite-difference procedure has been developed for calculating two phase flows with heat transfer in parallel, reverse and mixed flow manifolds. The flows are assumed to be homogeneous and one dimensional. An iterative numerical scheme is used to solve the differential equations for longitudinal momentum and continuity, while in the lateral direction an integral equation for momentum is solved. Numerical predictions compare well with the available experimental results for a combining flow manifold. The effect of total flow rate, heat input on the lateral flow distribution and pressure drop characteristics have been demonstrated. (9 refs.)

101318 Interfacial area and nucleation site density in boiling systems. G.Kocamustafaogullari (Dept. of Mech. Engng., Univ. of Wisconsin-Milwaukee, Milwaukee, WI, USA), M.Ishii.
Int. J. Heat & Mass Transfer (GB), vol.26, no.9, p.1377-87 (Sept. 1983).
The number density, which is one of the most important parameters affecting the interfacial area concentration in the bubbly two-phase flow system, is formulated in terms of the differential transport equation. From this formulation it becomes apparent that the active nucleation site site on a heated channel surface is the key parameter in the prediction of the bubble number density. A constitutive relation for active nucleation site density is developed in pool boiling and extended to forced convective nucleate boiling. The active nucleation site densities predicted by this constitutive relation are in relatively good agreement with direct measurements available in the literature. (35 refs.)

101319 The effect of the heat-transfer, phase transitions and gas dissolutioned in liquid on the oscillations of the vapor-gas bubbles. F.B.Nagiev, F.M.Mamedova.
Izv. Akad. Nauk Az. SSR Ser. Fiz.-Tekh. & Mat. Nauk (USSR), no.4, p.128-34 (1982). In Russian.
The effect of heat-transfer and disbalanced phase transitions on the small free oscillations of a vapor-gas bubbles in a liquid is considered. Numerical calculations of the natural resonant frequency and logarithmic decrement of the vapor-gas bubbles in the water are reduced. (8 refs.)

101320 The plane-parallel motion of a two-component liquid caused by the source. N.M.Kh.Abdel'Aziz.
Izv. Akad. Nauk Az. SSR Ser. Fiz.-Tekh. & Mat. Nauk (USSR), no.5, p.44-5 (1982). In Russian.
The complete qualitative investigation of the problem on the plane-parallel motion of a two-component incompressible liquid caused by the source is conducted. The qualitative pattern of the integral curve problems is constructed. (2 refs.)

101321 The effective reaction rate and diffusion coefficients for a two-phase medium. D.Bedeaux (Inst. for Teoretisk Fysikk, Norges Tekniske Hogskole, Trondheim, Norway), R.Kapral.
J. Chem. Phys. (USA), vol.79, no.4, p.1783-8 (15 Aug. 1983).
The transport properties of a system composed of an ensemble of small particles moving in a two-phase medium are calculated. One phase is assumed to be finely dispersed in the other so that the homogeneous regions are small compared to the size of the system. The particles may diffuse and react (disappear) in either phase. The coarse-grained (effective) reaction rate and diffusion coefficients are calculated for arbitrary volume fractions of the two phases for various cases. The calculation utilizes the introduction of background rate and diffusion coefficients to motivate the definition of self- and local density fields. The introduction of these fields in conjunction with the assumption of the random distribution of the inclusions of one phase in the other leads to reasonable approximations for the effective transport coefficient for all volume fractions. The result of model calculations are presented. (20 refs.)

101322 Stokes flow past bubbles and drops partially coated with thin films. II. Thin films with internal circulation—a perturbation solution. R.E.Johnson (Dept. of Theoretical & Appl. Mech., Univ. of Illinois, Urbana, IL, USA), S.S.Sadhal.
J. Fluid Mech. (GB), vol.132, p.295-318 (July 1983).
For pt.I see ibid., vol.126, p.237 (1983). The authors examine the steady axisymmetric creeping flow due to the motion of a liquid drop or a bubble which is partially covered by a thin immiscible fluid layer or film. The analysis is based on the assumption that surface-tension forces are large compared with viscous forces which deform the drop, and that the circulation in the film is weak. The latter assumption is satisfied provided that the film-fluid viscosity is not too small. A perturbation scheme based on the thinness of the fluid layer is used to construct the solution. One of the principal results is an expression for the drag force on the complex drop. The authors also find that the extent to which the drop or bubble is covered by the film has a maximum value depending on the magnitude of the driving force on the film.

In addition, they find the rather interesting result that when the ratio of the primary drop viscosity and bulk fluid viscosity is greater than $^1/_2$, the circulation within the film may have a double-cell structure. (7 refs.)

101323 Motion of gas bubbles during vacuumization of liquid aluminum in MDV-type magnetodynamic vacuumization apparatus. Yu.M.Gel'fgat, M.Z.Sorkin, V.P.Polishchuk, L.P.Puzhailo.
Magnetohydrodynamics (USA), vol.18, no.4, p.422-6 (Oct.-Dec. 1982). Translation of: *Magn. Gidrodin. (USSR)*, vol.18, no.4, p.105-9 (Oct.-Dec. 1982).
The authors quantitatively determine the appropriate dimensions of the active zone and parameters of metal processing in MDV-type sets on the basis of a theoretical analysis of the motion of an individual gas bubble through the upper T-zone in a magnetodynamic vacuumization set. (3 refs.)

101324 Identification of gas-liquid stream flow patterns. G.D.Khomyakov, R.N.Karataev, M.A.Kopyrin.
Sov. Aeronaut. (USA), vol.25, no.2, p.109-12 (1982). Translation of: *Izv. VUZ Aviats. Tekh. (USSR)*, vol.25, no.2, p.88-91 (1982).
The basic difference between the combined flow of gas and liquid through piping and the flow of a single-phase stream lies in the multiplicity of the structural forms (flow regimes), which are determined by the large number of parameters. In the general case the typical variables are the distribution of the components of the gas-liquid stream across the channel section, the flow velocity, the physical properties of the individual mixture components, and the variation of the pressure, density, and concentration. The study of gas-liquid steams is also complicated by the fact that the limits of their flow regimes are due not only to the channel walls but also to the internal phase interface surface, which varies in space and time. Therefore the laws describing the motion of gas-liquid mixtures in closed pipes are considerably more complex than the laws of single-phase media hydrodynamics. (8 refs.)

101325 Behaviour of a mixture of a non-Newtonian fluid with spherical solid particles with fixed centre. G.Maurice (Lab. d'Energetique et de Mecanique Theorique et Appl., Nancy, France).
Control of Distributed Parameter Systems 1982. Proceedings of the Third IFAC Symposium, Toulouse, France, 29 June-2 July 1982 (Oxford, England: Pergamon 1983), p.499-502
The problem of the determination of the law of behaviour of a composite material is an important question for new materials. This paper is concerned with a fluid-solid mixture and gives a contribution to the law of behaviour of a non-Newtonian fluid mixed with solid particles. It considers a regular flow around spherical particles whose centers have constant velocity. (13 refs.)

47.55M Flow through porous media

101326 Steady and unsteady regimes of flow of a multicomponent sorbable mixture through porous media. L.K.Filippov-Tsabek.
Fluid Dyn. (USA), vol.17, no.6, p.908-15 (Nov.-Dec. 1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Zhidk. & Gaza*, vol.17, no.6, p.114-23 (Nov.-Dec. 1982).
Contains an analysis, confirmed by computer-calculated numerical examples, of the one-dimensional nonstationary system of equations describing the concentration distributions of sorbable gases or liquids in a porous sorbent and in a flow through it. Solutions in the form of propagating waves are investigated in detail. The wave regimes for model sorption isotherms are classified. A representation for quasitraveling and quasispreading waves is introduced. (12 refs.)

101327 Moment method for the evaluations of heat transfer coefficients in a packed bed. H.-D.Juang, H.-S.Weng (Dept. of Chem. Engng., Nat. Cheng Kung Univ., Tainan, Taiwan).
Int. J. Heat & Mass Transfer (GB), vol.26, no.9, p.1275-81 (Sept. 1983).
The film heat transfer coefficient and thermal conductivity of solid particles in a packed bed can be determined from the moments of a response curve obtained by introducing a temperature pulse. The moment expressions are directly obtained from the Laplace transform of fluid temperature. The method and procedure to evaluate these two heat transport properties are described. (24 refs.)

101328 On Volterra's boundary value problem for axial-symmetric flows with free surfaces in porous media. M.T.Orasanu (Vocational School No.3, Bucharest, Rumania).

101329 How an initially stationary interface begins to move in porous medium flow. D.G.Aronson (School of Math., Univ. of Minnesota, Minneapolis, MN, USA), L.A.Caffarelli, S.Kamin.
SIAM J. Math. Anal. (USA), vol.14, no.4, p.639-58 (July 1983).
The interface studied is the boundary of a gas flowing in a homogeneous porous medium. It is known that for certain initial distributions the interface remains stationary for a positive time. The authors derive upper and lower estimates for this waiting time and give a condition which is sufficient to guarantee that the interface begins to move in a smooth manner. In some cases the estimates give the exact waiting time. (16 refs.)

101330 Seepage and heat flow in soil freezing. P.E.Frivik (Div. of Refrigeration Engng., Norwegian Inst. of Technol., Trondheim, Norway), G.Comini.
Trans. ASME. J. Heat Transfer (USA), vol.104, no.2, p.323-8 (May 1982).
The author describes a system of computer programs based on the finite element method, which can be used for the calculation of coupled velocity and temperature fields during freezing and thawing of soils in the presence of seepage flow. In the programs, the mass and energy conservation equations are solved simultaneously, without the use of too limiting assumptions. The results of the computations are compared with experimental measurements made on a laboratory model of a soil freezing system, and the agreement between measured and computed values is good. 47.60 FLOWS IN DUCTS, CHANNELS, AND CONDUITS

(for biological fluid dynamics, see 87.45)

101331 Mode propagation in nonuniform circular ducts with potential flow. Y.C.Cho (NASA Lewis Res. Center, Cleveland, OH, USA), K.U.Ingard.
AIAA J. (USA), vol.21, no.7, p.970-7 (July 1983).
A previously reported closed-form solution is expanded to determine effects of isentropic mean flow on mode propagation in a slowly converging-diverging duct: a circular cosh duct. On the assumption of uniform steady fluid density, the mean flow increases the power transmission coefficient. The increase is related directly to the increase of the cutoff ratio at the duct throat. With the negligible transverse gradients of the steady fluid variables, the conversion from one mode to another is negligible, and the power transmission coefficient remains unchanged with the mean flow direction reversed. (5 refs.)

101332 Spin-up in Couette flow. R.S.Rivlin (Center for the Application of Math., Lehigh Univ., Bethlehem, PA, USA).
Appl. Anal. (GB), vol.15, no.1-4, p.227-53 (1983).
A viscoelastic fluid is contained in the annular region between two infinitely long coaxial circular cylinders. The relation between shearing stress and the history of the rate of shear in the fluid is assumed to be linear. At some instant of time the inner cylinder is given an angular velocity which is subsequently held constant. The resulting angular velocity and stress fields are calculated. (6 refs.)

101333 Plane channel flows with surface mass transfer and velocity slip on moving walls. A.Szaniawski (Inst. of Fundamental Technol. Res., Polish Acad. of Sci., Warsaw, Poland).
Arch. Mech. (Poland), vol.34, no.3, p.309-24 (1982).
Exact integrals of the Navier-Stokes equations are used to describe laminar, steady, plane flows of a viscous, incompressible fluid in channels with porous, moving walls. At the walls the Beavers-Joseph slip conditions are assumed. The problem is reduced to find successively two functions fulfilling ordinary differential equations of the fourth and second order and satisfying six boundary conditions. The solution is obtained in the form of power series expansion with an iteration scheme for their coefficients. (15 refs.)

101334 Rotating supersonic flow about scoop inlet using an unsteady implicit technique. H.Mikami (Tokyo Inst. of Technol., Tokyo, Japan).
Bull. Res. Lab. Nucl. React. (Japan), vol.8, p.29-52 (1983).
The inlet flow fields in a rotating supersonic free stream are calculated by an implicit shock-capturing approximate-factorization finite-difference method. Calculations are performed for the flow about and through a straight wall inlet placed in a rapidly rotating supersonic flow and the steady-state solutions are presented for various values of the back pressure imposed at the downstream boundary of the inlet. The effect of the rotation in the free stream upon the flow and shock wave pattern are found very significant. The mass flow through the inlet is given as a function of the back pressure. (8 refs.)

101335 Features of two-phase flow in long channels. V.V.Fisenko, Z.P.Bil'der, I.A.Ivakhnenko, Yu.P.Mamalygin.
Power Eng. (J. Acad. Sci. USSR) (USA), vol.20, no.3, p.153-5 (1982). Translation of: *Izv. Akad. Nauk SSSR Energ. & Transp.*, vol.20, no.3, p.156-8 (1982).
Results are reported for experimental investigations into the hydrodynamics of a flow of saturated fluid in long channels; they make it possible to establish a self-similar (with respect to pipeline length) region of variation in specific fluid flow rate and pressure loss corresponding to critical discharge. The possibility of using a two-phase flow of fluid for long-distance transport of heat is considered. (8 refs.)

101336 Simulation of two-dimensional turbulence in a planar channel. V.G.Priimak, B.L.Rozhdestvenskii.
Fluid Dyn. (USA), vol.17, no.6, p.835-43 (Nov.-Dec. 1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Zhidk. & Gaza*, vol.17, no.6, p.26-35 (Nov.-Dec. 1982).
A study is made of the two-dimensional flow of an incompressible viscous fluid in a planar channel at supercritical Reynolds number $\mathrm{Re}=10^4$. Calculation of the flow over an appreciable time interval leads to the establishment of a statistically steady flow regime and stabilization of its averaged characteristics (the profile of the mean velocity, the mean pressure gradient, the pulsation energy, etc.). The calculations show that numerical simulation of turbulent flow of an incompressible fluid on the basis of the Navier-Stokes equations leads to qualitatively correct characteristics of this flow regime. (15 refs.)

101337 Experimental investigation of heat transfer and hydraulic resistance in the channels with alternating cross-section. I.N.Il'in, I.V.Bekmanis.
Latv. PSR Zinat. Akad. Vestis Fiz. Teh. Zinat. Ser. (USSR), no.3, p.56-61 (1983). In Russian.
Experimental results of the channel form influence on heat transfer and hydraulic characteristics are given. Dependence $Nu_S=f(Eu_S)$ expressing the direct correlation in a criterial form between heat transfer coefficient and hydraulic resistance is obtained. (2 refs.)

101338 Post-burnout heat transfer to Freon flowing in a vertical tube at high subcritical pressures. K.Nishikawa, S.Yohida, H.Mori, H.Takamatsu (Mech. Engng., Kyushu Univ., Fukuoka, Japan).
Mem. Fac. Eng. Kyushu Univ. (Japan), vol.43, no.1, p.109-32 (March 1983).
Experimental data were obtained of the post-burnout heat transfer to Freon 22 flowing upward in a vertical, uniformly heated round tube at high subcritical pressures over a range of reduced pressure from 0.68 to 0.84. Based on an assumed model, the actual quality was estimated from the heat transfer data. The distinctive characteristics of the difference between the vapor mass fraction in the thermodynamic equilibrium state and the actual quality were found in the low and high equilibrium quality region respectively. Dimensional correlations of this difference were tentatively obtained. (10 refs.)

101339 Numerical model for dynamic and thermal developments of a pulsed laminar ducted flow. R.Creff (Univ. d'Orleans, Orleans, France), J.Batina, P.Andre, V.S.Karunanithi.
Numer. Heat Transfer (USA), vol.6, no.2, p.173-88 (April-June 1983).
A numerical model is constructed to analyze the simultaneous development of the dynamic and thermal regimes of an incompressible viscous ducted flow under the influence of sinusoidal pulsations. The Navier-Stokes and energy equations are solved by a finite-difference method and by using asymptotic developments for the different dynamic and thermal functions. The model is validated by obtaining the Poiseuille regime for steady mean flow and by verifying Uchida's solutions for the unsteady dynamic components in fully developed flow. The model allows the description of Richardson's effect and depicts the existence of an annular effect for the pulsed temperature term. (11 refs.)

101340 Wave motion of a liquid in an inhomogeneous tube. R.Yu.Amenzade, V.G.Nasibov (S.M. Kirov State Univ., Azerbaidzhan SSR).
Sov. Phys.-Dokl. (USA), vol.27, no.11, p.909-10 (Nov. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.1-3, p.318-21 (Nov. 1982).
The authors extend the method of Amenzade (1980) using the hydraulic approximation to include a wave travelling in the opposite direction in an infinite tube as a result of the system being closed (e.g. arterial). (8 refs.)

101341 Nonlinear periodic wave and fission of a solitary wave in a slowly varying channel with arbitrary cross-section. Zhou Xianchu (Inst. of Mech., Acad. Sinica, Beijing, China).
Sci. Sin. (China), vol.26, no.6, p.626-36 (June 1983).
The cnoidal wave, the solitary wave in a channel with slowly varying arbitrary cross-section in the flow direction and the fission of a solitary wave in this channel have been studied. The KdV equation with slowly varying coefficients is derived. The first term of its asymptotic solution, the phase velocity, the period and the relation between the elevation of wave and the channel geometry are obtained. The discriminant for the number of solitary wave after fission and the expression of its amplitude are also obtained. These results have been applied to the case of the rectangular and the triangular channels. For the rectangular channel, they are fairly consistent with those of Madsen and Mei (1969), Johnson (1973), Svendsen and Buhr Hansen (1978). (14 refs.)

47.65 MAGNETOHYDRODYNAMICS AND ELECTROHYDRODYNAMICS

(for MHD in plasma, see 52.30)

101342 Hall effects on an oscillatory MHD flow in the Stokes problem past an infinite vertical porous plate. I. A.K.Singh (Dept. of Math., Banaras Hindu Univ., Varanasi, India).
Astrophys. & Space Sci. (Netherlands), vol.93, no.1, p.1-13 (June 1983).
Hall effects on the hydromagnetic free convection flow of an electrically conducting incompressible viscous fluid past a steadily moving vertical porous plate has been analysed when the free stream oscillates in magnitude. The flow is subjected to a constant suction, through the porous plate, and the difference between wall temperature and the free-stream is moderately large causing the free convection currents. The mathematical analysis is presented for the hydromagnetic boundary layer flow without taking into account the induced magnetic field. (6 refs.)

101343 Hall effects on MHD free-convection flow in the Stokes problem for a vertical porous plate. A.K.Singh (Dept. of Math., Banaras Hindu Univ., Varanasi, India).
Astrophys. & Space Sci. (Netherlands), vol.93, no.1, p.177-84 (June 1983).
Hall effects on the MHD flow of an incompressible, electrically-conducting viscous fluid past an impulsively started infinite vertical porous plate has been analysed for the case of small magnetic Reynolds number. Exact solutions have been obtained for the axial and the transverse components of the velocity and the skin-friction by defining a complex velocity with the help of the Laplace transform technique. The velocity profiles are shown graphically and the numerical values of axial and transverse components of skin-friction are tabulated for different values of the dimensionless parameters occurring in the problem. (8 refs.)

101344 Precipitation of charged particles from flow filling cylindrical channel. F.G.Portnov, S.E.Fal'kenshtein, A.B.Shmidt.
Power Eng. (J. Acad. Sci. USSR) (USA), vol.20, no.3, p.88-91 (1982). Translation of: *Izv. Akad. Nauk SSSR Energ. & Transp.*, vol.20, no.3, p.90-4 (1982).
Numerical methods are used to solve a system of equations of electrogasdynamics that describes the two-dimensional unsteady mass transfer of charged particles in a cylindrical channel. An estimate is given for the influence of the value of a dimensionless parameter that characterizes the concentration and the charge of the particles on the degree of precipitation of the latter. (10 refs.)

101345 Use of an electric field to keep bubbles and drops in a given shape and position in a liquid dielectric. I.I.Ievlev, A.B.Isers.
Fluid Dyn. (USA), vol.17, no.6, p.899-902 (Nov.-Dec. 1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Zhidk. & Gaza*, vol.17, no.6, p.101-5 (Nov.-Dec. 1982).
A study is made of the problem of finding an electric field that keeps a spherical gas bubble in a fixed position in a dielectric liquid in a gravity field. (5 refs.)

101346 Temperature-gradient-driven electrohydrodynamic instability with unipolar injection in air. J.F.Hoburg (Dept. of Electrical Engng., Carnegie-Mellon Univ., Pittsburgh, PA, USA).
J. Fluid Mech. (GB), vol.132, p.231-45 (July 1983).
Electrohydrodynamic instability is described in a planar region of gas, with unipolar injection through a linear temperature gradient, with corresponding mobility, viscosity, and density gradients. The role of charge-relaxation instability, which is incipient at a critical value of electric Rayleigh number in a uniform mobility layer, is distinguished from the mobility-gradient-driven mechanism, which can produce instability at much smaller voltage thresholds. Relative values of electroviscous time, viscous diffusion time and ion transit time determine the nature of the instability process. The instability is stationary or dynamic for wavenumbers respectively below or above a critical value. The fastest-growing wavenumber and corresponding growth rate are determined as functions of time constants and temperature gradient. (24 refs.)

101347 Relation of the generation coefficient to the mean spirality of an almost-toroidal hydrodynamic flow. E.P.Kropachev.
Magnetohydrodynamics (USA), vol.18, no.4, p.343-5 (Oct.-Dec. 1982). Translation of: *Magn. Gidrodin. (USSR)*, vol.18, no.4, p.18-20 (Oct.-Dec. 1982).
Equations have been derived for magnetic field generation in the toroidal flow of a conducting liquid perturbed by small unsymmetrical velocities having a radial component. The examination is performed in a special quasispherical coordinate system, r, θ,ϕ (nonorthogonal) for which the components of the metrical tensor g_{ik} have been determined together with the basis vectors e_i and e^i, with the main flow (toroidal) localized along the basis vector e_ϕ in this system and taking the form $\nu e_\phi/S$. (2 refs.)

101348 Dynamics of a magnetizable fluid layer on the surface of a nonmagnetic fluid in an external magnetic field. A.I.Zhakin.
Magnetohydrodynamics (USA), vol.18, no.4, p.356-62 (Oct.-Dec. 1982). Translation of: *Magn. Gidrodin. (USSR)*, vol.18, no.4, p.33-8 (Oct.-Dec. 1982).
The author investigates the motion of a magnetizable fluid layer on the surface of a nonmagnetic fluid medium in an external magnetic field; this problem is important, for example, in relation to the removal of petroleum products from the surface of water. (4 refs.)

101349 Trajectory of freely falling conducting particles in a nonuniform magnetic field. G.K.Grinberg, M.Z.Kaudze, O.A.Lielausis, E.V.Murav'ev.
Magnetohydrodynamics (USA), vol.18, no.4, p.369-73 (Oct.-Dec. 1982). Translation of: *Magn. Gidrodin. (USSR)*, vol.18, no.4, p.46-50 (Oct.-Dec. 1982).
Strong magnetohydrodynamic interaction prevents liquid metals from being used as the working medium in equipment utilizing strong magnetic fields, for example in equipment with magnetic plasma confinement. A radical technique for diminishing the strength of MHD interaction is to break up the continuous flow of liquid metal into a system of droplets. One of the most important aspects of the investigated problem is the extent to which a strongly nonuniform field will deflect a particle from its initially rectilinear trajectory. Murav'ev (1980) has solved the problem of the motion of a conducting spherical particle in a nonuniform magnetic field and obtained expressions for the forces and torques acting on it. In the present study the authors test these expressions experimentally. (9 refs.)

101350 Three-dimensional effects generated in a finite-length container under the action of a rotating magnetic field. A.B.Kapusta, A.F.Zibol'd.
Magnetohydrodynamics (USA), vol.18, no.4, p.379-84 (Oct.-Dec. 1982). Translation of: *Magn. Gidrodin. (USSR)*, vol.18, no.4, p.57-63 (Oct.-Dec. 1982).
If a rotating liquid is placed between planes perpendicular to the axis of rotation, three-dimensional axisymmetric flows occur near the planar surfaces, with the liquid flowing toward the axis near the wall and rejected outwards at

some distance from it, similar three-dimensional effects also occur when an axial magnetic field is applied to a rotating liquid. The necessity of investigating three-dimensional structure, generated in a finite-length vessel, and its evolution with parameter changes is related to the possibility of using one-dimensional models of primary laminar flow in stability problems. In the noninductive approximation ($\bar{\omega}<1$) the authors consider a three-dimensional axisymmetric stationary flow of a conducting liquid, excited in a cylindrical container of finite length by a rotating magnetic field of arbitrary symmetry, homogeneous along the z axis. It is assumed that the conductivity of the ends of the container is of the order of the liquid conductivity. Under these conditions it can be assumed that the field of electromagnetic forces is also homogeneous along the z axis. For magnetic field excitations the authors use an ideal inductor, creating only a primary harmonic field. (10 refs.)

101351 Energy characteristics of cylindrical induction pumps at large R_m numbers. B.B.Volchek, L.M.Dronnik, S.Yu.Reutskii, I.M.Tolmach, A.I.Elkin.
Magnetohydrodynamics (USA), vol.18, no.4, p.398-404 (Oct.-Dec. 1982). Translation of: *Magn. Gidrodin. (USSR)*, vol.18, no.4, p.79-85 (Oct.-Dec. 1982).
Gailitis and Lielansis (1975) were the first to point out the possibility of the existence of a fixed nonuniformity in the distribution of the axial velocity and in the resulting induction along the ϕ-coordinate in the coaxial channel of cylindrical induction pumps. Criteria were derived for the establishment of such nonuniformity, which were obtained based on the asumption that the equation of motion for the liquid metal in the pump channel is algebraic, i.e. the equation of motion for the liquid metal in the pump channel is algebraic, i.e. the equation does not take into account the term with the second derivative of the velocity with respect to the ϕ-coordinate and the viscosity, which in the general case is turbulent. The present authors investigate the steady flow conditions in the coaxial channel of the cylindrical pump including the turbulent viscosity term in the equation of motion. (7 refs.)

101352 Calculation of the secondary circuit inductance in linear inductive MHD machines. A.M.Andreev.
Magnetohydrodynamics (USA), vol.18, no.4, p.405-8 (Oct.-Dec. 1982). Translation of: *Magn. Gidrodin. (USSR)*, vol.18, no.4, p.86-8 (Oct.-Dec. 1982).
The inductance of the secondary circuit becomes noticeable inductive electromagnetic MHD machines when the thickness effect is clearly distinguishable. The secondary current is then no longer in phase with the EMF induced in the liquid metal. This leads to increases in the primary current and in the supplied voltage. Resistances r_a, x_s, x_m, current I_μ, and the EMF E_1 are calculated from well-known equations in use for electric machinery and magnetohydrodynamics. (2 refs.)

101353 End effect in MHD-type linear induction machine with finite-length inductor: mathematical model. M.S.Drits.
Magnetohydrodynamics (USA), vol.18, no.4, p.408-14 (Oct.-Dec. 1982). Translation of: *Magn. Gidrodin. (USSR)*, vol.18, no.4, p.89-95 (Oct.-Dec. 1982).
Solution of the external problem of end effect is important in the theory of linear MHD induction machines. In the case of a narrow nonmagnetic gap, it is often possible to obtain sufficiently reliable results on the basis of one-dimensional models; in the case of a wide gap one requires at least two-dimensional models accounting for the distribution of fields lengthwise and over the thickness. The author proposes a new mathematical model, one that takes into account the finite inductor dimensions and the finite magnetic permeability, which can be useful for the design of a large class of machines (including chutes) with wide nonmagnetic gap. (14 refs.)

101354 Experimental study of flat MHD induction pump. Ya.Ya.Valdmanis, R.R.Krishberg, A.Ya.Shishko.
Magnetohydrodynamics (USA), vol.18, no.4, p.419-22 (Oct.-Dec. 1982). Translation of: *Magn. Gidrodin. (USSR)*, vol.18, no.4, p.101-4 (Oct.-Dec. 1982).
An important problem in producing high-power MHD pumps is ensuring hydrodynamic flow stability in the active channel. Theoretical and experimental studies have revealed that at high values of the magnetic Reynolds number the average profile of turbulent flow becomes nonuniform and there may appear zones of reverse flow. Results of experimental studies are presented revealing further ways to simulate processes of hydrodynamic instability. (5 refs.)

101355 Some features of MHD separation process. U.I.Ivanov.
Magnetohydrodynamics (USA), vol.18, no.4, p.426-9 (Oct.-Dec. 1982). Translation of: *Magn. Gidrodin. (USSR)*, vol.18, no.4, p.110-12 (Oct.-Dec. 1982).
The author describes the motion of particles during MHD separation by an analysis of the basic laws governing the constitution of the skin phase and the characteristics of mass transfer through it under the influence of an external electromagnetic field. The current densities in the region of inhomogeneities as well as the velocities and the direction of motion in a nonhomogeneous system under the influence of an electromagnetic field are all determined principally by the properties of the skin phase. An electromagnetic field acts on the skin layer throughout the thickness of the latter, but most strongly on its nearest layer whose thickness and properties will be altered as a result. The preceding analysis makes it possible to solve modeling problem and to identify classes of similar phenomena in MHD separation processes. (3 refs.)

47.70 REACTIVE, RADIATIVE, OR NONEQUILIBRIUM FLOWS

101356 Critical fluctuations in a thermo-chemical instability. C.van den Broeck (Dept. Natuurkunde, Vrije Univ. Brussel, Brussels, Belgium).
Dynamical Systems and Chaos. Proceedings of the Sitges Conference on Statistical Mechanics, Sitges, Barcelona, Spain, 5-11 Sept. 1982 (Berlin, Germany: Springer-Verlag 1983), p.264-5
Thermo-chemical systems have been studied in detail in the engineering sciences, but only recently attention has been paid to the effect of fluctuations. In these systems the coupling of thermal and chemical variables can give rise to instabilities leading to multiple steady states, limit cycles and chaotic behaviour. The author has investigated the effect of both homogeneous and inhomogeneous fluctuations in the simplest case of an instability leading to multiple steady states. (5 refs.)

47.75 RELATIVISTIC FLUID DYNAMICS

101357 Existence and unicity of the Cauchy problem for a relativistic heat conducting fluid. V.Carfi (Dipartimento di Matematica, Messina, Italy). •
Lett. Nuovo Cimento (Italy), vol.37, ser.2, no.13, p.477-80 (30 July 1983). In Italian.
Proves the existence and unicity of the Cauchy problem, in a certain Gevrey class, for the evolution system of a relativistic heat-conducting fluid. (4 refs.)

47.80 INSTRUMENTATION FOR FLUID DYNAMICS

101358 Seven-hole cone probes for high angle flow measurement: theory and calibration. K.N.Everett, A.A.Gerner, D.A.Durston (NASA Ames Res. Center, Moffett Field, CA, USA).
AIAA J. (USA), vol.21, no.7, p.992-8 (July 1983).
A non-nulling seven-hole conical pressure probe capable of measuring flow conditions at angles up to 75 deg relative to its axis is described. The theoretical rationale of the seven-hole probe is developed and the calibration procedure outlined. Three-variable third-order polynomial functions are used to represent local values of relative flow angles, total pressure, and total minus static pressure. These flow properties are determined explicitly from measured probe pressures. Flow angles are determined within 2.5 deg and Mach number within 0.05 with 95% certainty. The probe can be used in subsonic compressible and incompressible flows. (6 refs.)

101359 A user oriented analysis of a constant-temperature hot-wire anemometer—for practical applications. F.Sakao.
Bull. Fac. Eng. Hiroshima Univ. (Japan), vol.30, no.2, p.129-35 (Nov. 1982). In Japanese.
The operation of a constant-temperature hot-wire anemometer is analysed with naive physical interpretation and minimum of mathematics—actually only some algebra. Though extremely simple and easy to understand as it is, it can reproduce exactly all the relevant informations hitherto obtained only through number of equatoins: to name some, frequency limit of the response to the wind velocity fluctuation, a method for testing it, etc. (no refs.)

101360 Ultrasonic flow measurement. S.v.d.Groenendaal.
PT/Elektrotech. Elektron. (Netherlands), vol.38, no.6, p.36-41 (June 1983). In Dutch.
Eight alternatives for measuring the fluid flow in a pipe are outlined. The principles involved are identified as transmission time (subdivided into time, phase and frequency difference, and amodified time difference), Doppler effect, angular deflection, cross-correlation and wave frequency. The article is mainly concerned with the frequency difference or 'sing-around' principle, especially the system devised by Danfoss. This uses two 'clamp-on' scanners on either side of the pipe to make an angle of 45 degrees with the flow centre-line. A block diagram shows the layout of the main components (multiplexers, amplifier, phase detector, decoder, integration and summation units, and VCO) and illustrates the connections between these and current waveforms at various circuit stages. Advantages of the Danfoss system are summarised. The EMUF unit may be used with an EMAT type totaliser. (no refs.) *G.C.*

101361 Compact, pulsed laser Doppler anemometer for airborne and wind-tunnel applications. A.Koneke, P.G.Sava, J.P.Hancy (Inst. Franco-Allemand de Recherches de Saint-Louis, Saint-Louis, France).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.356, p.26-32 (1983). (Field Measurement and Calibration Using Electro-Optical Equipment: Issues and Requirements, San Diego, CA, USA, 24-25 Aug. 1982).
Describes a laser Doppler anemometer working in backscatter over distances of 2 to 5 meters based on a pulsed laser source. After a description of the optical set-up and the pulsed laser the authors describe a number of experiments carried out under conditions normally found in industrial testing facilities. (6 refs.)

101362 Thermoanemometric measurement of three-dimensional flow velocity. A.M.Novikov, A.I.Yatsenko.
Izv. VUZ Priborostr. (USSR), vol.26, no.6, p.26-30 (June 1983). In Russian.
The problem of measuring the mean velocity vector of a three-dimensional flow by means of thermoanemometric sensors of various different designs is considered. The error in determining the mean flow velocity vector is found to be not more than 6%, making the method and equipment described suitable for use in practical experiments. (2 refs.) *L.M.H.*

101363 A technique for the direct measurement of volume flux of a plume. W.D.Baines (Dept. of Mech. Engng., Univ. of Toronto, Toronto, Canada).
J. Fluid Mech. (GB), vol.132, p.247-56 (July 1983).
It is observed that an interface is established in any open-ended vertical cylinder when a plume flows in the direction of a mean flow through the cylinder. The location of the interface defines the volume flux of the plume because the total discharge in the environment has been entrained at this level. Experiments have been conducted to verify this relation and to define the limits within which the interface is established. It is found that, as the

buoyancy in the plume is reduced or the area of the environment is reduced, limits do exist. An application of the interface in industrial-building ventilation is described. (4 refs.)

101364 On the calculation of the signal rate with the laser Doppler anemometer in burst operation. W.Fuchs, H.-E.Albrecht, W.Kroger.
MSR (Mess. Steuern Regeln) (Germany), vol.26, no.6, p.331-5 (June 1983). In German.
The laser Doppler anemometer allows a quasi point-related flow speed measurement. The measurement principle is connected with an evaluation of the absolute value of the velocity and due to the ellipsoidal form of the measurement volume with an evaluation of the flow direction in the signal rate. The scanning volume is determined by the minimal measurement time necessary for the electronic evaluation device. Starting from a statement of Buchhave the influences of the measurement volume and the minimal measurement time upon the signal rate are determined. By use of error propositions in the data rate the velocity limits for the known information processing methods are given in dependence upon the used pre-shifting frequencies. (9 refs.)

101365 Use of the photochromic properties of mercury dithizonate in hydrodynamics. M.Cloitre, J.Chauveau (Lab. d'Hydrodynamique et Mecanique Physique, ESPCI, Paris, France).
Opt. Commun. (Netherlands), vol.47, no.1, p.42-6 (1 Aug. 1983). In French.
Presents the results of using mercury dithizonate (which is a photochromic compound) in a visualization experiment in hydrodynamics. The authors describe its chemical preparation and its photochemical properties. Finally, the authors apply the mercury dithizonate to the measurement of mass diffusivity coefficients in liquids by forced Rayleigh scattering. (8 refs.)

101366 Burst-correlation laser Doppler velocimetry. R.G.W.Brown, R.Jones (Royal Signals & Radar Establ., Great Malvern, England).
Opt. Lett. (USA), vol.8, no.8, p.449-51 (Aug. 1983).
The first continuous real-time burst-correlation laser velocimetry results obtained to the authors' knowledge are reported. Measurements of turbulence power spectra and velocity-correlation functions with photon-correlation techniques are demonstrated. (9 refs.)

101367 A magnetic flowmeter with conducting pipe wall. H.Yamasaki, S.Honda, T.J.Chin (Univ. of Tokyo, Tokyo, Japan), C.Akiyama.
Trans. Soc. Instrum. & Control Eng. (Japan), vol.19, no.5, p.394-9 (May 1983). In Japanese.
The internal pipe wall of magnetic flowmeters should be nonconductive to prevent generated electromotive force from short circuiting. Usually the inside of the metallic pipe is lined by insulating material. The lining material limits applicable temperature range of measured fluid and also reliability of meter. This paper describes a technique to eliminate the lining and to improve the reliability and performance of magnetic flowmeters. (5 refs.)

101368 Measurement of double and triple velocity-correlations by means of streamwise orientated rotated X-hot-wire probes. L.Paulsen (Univ. Karlsruhe, Karlsruhe, Germany).
Tech. Mess. tm (Germany), vol.50, no.7-8, p.267-72 (July-Aug. 1983). In German.
The equations for the experimental determination of double and triple velocity-correlations are derived. The expression for the effective cooling velocity has been expanded in a series and higher-order terms neglected. A method has been developed which allows one to simulate a turbulent velocity field with an arbitrary Reynolds tensor. The results show that serious errors occur as the turbulence intensity exceeds 1% for third-order correlations and 10% for second-order correlations. This is emphasized by a comparison of actual measurements in a free jet. (7 refs.)

101369 Calibration of film probes using a submerged jet. A.J.Johnston, I.Grant, A.R.Halliwell (Dept. of Civil & Mining Engng., Wollongong Univ., Wollongong, Australia).
Trans. Inst. Eng. Aust. Civ. Eng. (Australia), vol.CE25, no.2, p.143-7 (May 1983).
A simple but practical experimental method is presented for calibrating hot-film anemometer probes and other small velocity transducers in low velocity flows. (5 refs.)

51.00 KINETIC AND TRANSPORT THEORY OF FLUIDS; PHYSICAL PROPERTIES OF GASES

51.10 KINETIC AND TRANSPORT THEORY

101371 H-theorem and trend to equilibrium in the kinetic theory of gases. C.Cercignani (Istituto di Matematica, Politecnico di Milano, Milano, Italy).
Arch. Mech. (Poland), vol.34, no.3, p.231-41 (1982).
The present status of the *H*-theorem and its role in establishing the trend to equilibrium of a dilute gas are reviewed. In particular the alleged counterexamples are shown to contain some features which do not allow the use of the standard arguments. (34 refs.)

101372 On the free molecule quenching of a gas jet by another gas at rest. L.Trilling (MIT, Cambridge, MA, USA).
Arch. Mech. (Poland), vol.34, no.3, p.333-41 (1982).
The collision rate of jet molecules with reservoir molecules is considered as a function of the jet velocity and the temperature of the gases. Both the total number of collisions and the collisions with relative velocities bounded by some threshold velocity are found. Further the computation of the relative kinetic energy flux is discussed. The results obtained are a generalization of those known previously. Their applicability to the problem of nucleation of freely expanding vapour is briefly discussed. (1 ref.)

101373 On material frame-indifference, intrinsic spin, and certain constitutive relations motivated by the kinetic theory of gases. A.I.Murdoch (Dept. of Maths., Univ. of Strathclyde, Glasgow, Scotland).
Arch. Ration. Mech. & Anal. (Germany), vol.83, no.2, p.185-94 (1983). (14 refs.)

101374 Example of exact solution of a problem of gas compression by a spherical shell. A.M.Svalov.
Fluid Dyn. (USA), vol.17, no.6, p.961-4 (Nov.-Dec. 1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Zhidk. & Gaza*, vol.17, no.6, p.176-9 (Nov.-Dec. 1982).
A study is made of the problem of isentropic compression of gas by a spherical shell of finite thickness on the exterior of which there is a vacuum. The complete solution to the problem with different boundary conditions and different equations of state for the shell and the compressible medium is possible only numerically. However, there exists a class of exact solutions to the equations of gas dynamics with linear radial distribution of the velocities of the particles in which contact discontinuities are allowed. For this it is necessary that both the shell and the compressible medium be described by the same equation of state $p=(\gamma-1)\rho E$ with the same specific heat ratio $\gamma=c_p/c_v$. There can be arbitrarily many such discontinuities in the solution, i.e., this class of solutions can describe the compression of matter by multilayer shells. A restriction is made to a single-layer shells with specific heat ratio $\gamma=5/3$. (2 refs.)

101375 Simulation of a two-dimensional gas. Y.Kohayakawa, R.Mainieri, O.Helene (Inst. de Fisica, Univ. de Sao Paulo, Sao Paulo, Brazil).
Rev. Bras. Fis. (Brazil), vol.12, no.4, p.709-19 (Dec. 1982). In Portuguese.
The authors present the result of a computer simulation of two two-dimensional gases, initially at different temperatures. The results are effective in demonstrating the energy equipartition. The observed energy and velocity distribution after the equilibrium agree with the proper (two-dimensional) theoretical distribution. (4 refs.)

101376 Distortion of Maxwell distribution in relaxing gas. T.T.Karasheva, D.K.Otorbaev, V.N.Ochkin, V.A.Rykov, S.Yu.Savinov, N.N.Sobolev.
Sov. Phys.-Lebedev Inst. Rep. (USA), no.10, p.47-52 (1982). Translation of: *Sb. Kratk. Soobshch. Fiz. AN SSSR Fiz. Inst. P.N. Lebedeva*, no.10, p.53-8 (1982).
By using a numerical solution of the Boltzmann equation in the hard-sphere approximation for a gas in a thermostat, arbitrary values of the ratio of masses of the colliding particles, and an arbitrary deviation from equilibrium, it is shown that during the relaxation process, the initial Maxwell velocity distribution of particles is not conserved, and the deviation from this distribution can be considerable. 51.20 VISCOSITY AND DIFFUSION: EXPERIMENTAL

101377 The viscosity of carbon-monoxide mixtures with four gases in the temperature range 25-200°C. Supplement. J.Kestin (Div. of Engng., Brown Univ., Providence, RI, USA), S.T.Ro.
Ber. Bunsenges. Phys. Chem. (Germany), vol.87, no.7, p.600-2 (July 1983).
Reports new, absolute measurements of the viscosity of carbon monoxide (CO) with krypton (Kr), carbon dioxide (CO_2), methane (CH_4) and carbon tetrafluoride (CF_4). The measurements have been carried out in an oscillating-disk viscometer at a pressure of 0.1 MPa in the temperature range 25-200°C. The accuracy is estimated to lie between ±0.1% and ±0.2%. The data have been correlated by means of the two-parameter extended law of corresponding states. They have been utilised to derive binary diffusion coefficients. The paper is a supplement to an earlier publication on mixtures with He, Ne, Ar, and N_2. The great similarity between the viscosity of binary mixtures with N_2 and CO, respectively, is confirmed to a high degree of accuracy. (7 refs.)

51.30 THERMAL PROPERTIES OF GASES

101378 Question of the heat conductivity of inert gases at low temperatures. O.A.Kolenchits, N.A.Nesterov (Inst. of Appl. Phys., Acad. of Sci., Minsk, Belorussian SSR).
J. Eng. Phys. (USA), vol.43, no.6, p.1384-8 (Dec. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.6, p.970-6 (Dec. 1982).
Theoretical and experimental data on the heat conductivity of inert gases at temperatures below 273K are shown to be in agreement. (14 refs.)

101379 Excess enthalpies for (water+nitrogen)(g) up to 698.2K and 12.6 MPa. C.J.Wormald, C.N.Colling (School of Chem., Univ. of Bristol, Bristol, England).
J. Chem. Thermodyn. (GB), vol.15, no.8, p.725-37 (Aug. 1983).
A new flow mixing calorimeter has been used to make measurements of the excess enthalpy of (water+nitrogen)(g) at temperatures up to 698.2K and pressures up to 12.6 MPa. Tests on the calorimeter, and consistency tests on the measurements, suggest that the results are free from significant errors. The measurements are fitted to an equation from which excess volumes and compression factors for the mixture are calculated. (20 refs.)

51.50 ELECTRICAL PHENOMENA IN GASES

(see also 52. Plasma and electric discharges)

101380 Mobilities and interaction potentials for Br^--Ar, Br^--Kr, and Br^--Xe. D.R.Lamm, R.D.Chelf, J.R.Twist, F.B.Holleman, M.G.Thackston, F.L.Eisele, W.M.Pope, I.R.Gatland, E.W.McDaniel (School of Phys., Georgia Inst. of Technol., Atlanta, GA, USA).
J. Chem. Phys. (USA), vol.79, no.4, p.1965-8 (15 Aug. 1983).
Mobilities of Br^- ions in Ar, Kr and Xe gases at 300K have been measured in a drift tube mass spectrometer over a wide range of E/N (the ratio of the electric field to the neutral gas number density). For any ion-neutral gas interaction potential, implementation of the Viehland-Mason kinetic theory (accurate for arbitrary E/N) yields theoretical mobility data. This theory is employed in conjunction with an iterative-inversion scheme which uses experimental mobility data to modify an initial 'guess' 4,6,12 potential to produce a 'directly determined' potential which accurately reproduces the experimental mobilities for a given ion-neutral atom pair. These potentials are tabulated for Br^--Ar, Br^--Kr, and Br^--Xe and their salient features are compared to previous 'directly derived' potentials of other ions in these gases. (12 refs.)

101381 Mobilities of various mass-identified positive ions in helium, neon, and argon. H.Bohringer, M.Durup-Ferguson, D.W.Fahey (Aeronomy Lab., NOAA Environment Res. Labs., Boulder, CO, USA).
J. Chem. Phys. (USA), vol.79, no.4, p.1974-6 (15 Aug. 1983).
The mobilities of several mass-identified positive ions in helium, neon, and argon buffer gases were measured in a flow drift tube apparatus as a function of E/N at 297K. The systems studied were N_2O^+, ${NO_2}^+$, and ${SO_2}^+$ in He, H_2O^+, ${O_2}^+$, and N_2O^+ in Ne, and H_2O^+, H_3O^+, N_2O^+, ${NO_2}^+$, and ${SO_2}^+$ in Ar. The values obtained were compared to previous measurements and Langevin mobilities and were used to estimate the well depth of the ion buffer interaction potential. (20 refs.)

(for liquids, see 75.)

101382 Kinetic studies of the bromine-oxygen system: a new paramagnetic particle, BrO_2. N.I.Butkovskaya, I.I.Morozov, V.L.Tal'rose, E.S.Vasiliev (Inst. of Chem. Phys., Acad. of Sci., Moscow, USSR).
Chem. Phys. (Netherlands), vol.79, no.1, p.21-30 (15 Aug. 1983).
The paramagnetic BrO_2 molecule with lifetime $\tau > 10$ s has been found among the products of the $O+Br_2$ reaction in a discharge flow system. Identification was made by the technique of molecular beam focusing in an inhomogeneous magnetic field with mass-spectrometric detection. Its symmetry appeared to be C_{2v}, like the stable OClO molecule, as was determined by focusing in an inhomogeneous electric field. Approximate rate constants for the reactions $O+BrO_2$ ($k_5=(2.5\text{-}6)\times 10^{-12}$ cm^3/s) and $Br+BrO_2$ ($k_7 \approx 5\times 10^{-11}$ cm^3/s) were obtained. (18 refs.)

52.20F Electron collisions

101384 Collision dominated relaxation of electrons in a weakly ionized nitrogen plasma after abrupt change of the electric field. M.Capitelli, C.Gorse (Univ. di Bari, Bari, Italy), J.Wilhelm, R.Winkler.
Chem. Phys. (Netherlands), vol.79, no.1, p.1-7 (15 Aug. 1983).
The investigations are related to the relaxation of the electron component to new stationary states and start from different stationary states, caused by an abrupt change of the electric field in a molecular nitrogen plasma. By numerically solving the time-dependent Boltzmann equation for the electron the temporal evolution of the energy distribution and of resulting macroscopic quantities is obtained. A relaxation time of $\approx 10^9$ cm^{-3} s has been obtained in all cases considered, independent of the eventual presence of vibrationally excited molecules. The results are discussed on the basis of the effectiveness of energy transfer in the collisional processes. (13 refs.)

101385 Influence of plasma-chemical processes of formation of electronegative molecules on the parameters of non-self-sustained discharges. K.S.Klopovskii, A.P.Osipov, I.G.Persiantsev, A.T.Rakhimov, T.V.Rakhimova, N.V.Suetin, M.A.Timofeev (M.V. Lomonosov State Univ., Moscow, USSR).
Sov. Phys.-Dokl. (USA), vol.27, no.11, p.951-3 (Nov. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.1-3, p.607-10 (Nov. 1982).
Attention is drawn to the fact that new electronegative molecules, the attachment of electrons to which proceeds with higher efficiency, leading to a decrease in plasma conductivity, can be formed as a result of plasma-chemical reactions in the process of burning of a discharge in an electronegative gas. An example of such a reaction is ozone formation in a non-self-sustained discharge in air. (5 refs.)

52.25 PLASMA BASIC PROPERTIES

101386 General form for the electron distribution function for an inhomogeneous fully ionized and magnetized plasma interacting with an alternating electric field. I.Burdujan, D.Zoler (Inst. Politehnic Iasi, Iasi, Rumania).
Beitr. Plasma Phys. (Germany), vol.23, no.4, p.399-409 (1983).
The authors give a general form for the isotropic and vectorial part of the distribution function for electrons, in a fully ionized and magnetized plasma, interacting with an alternating electric field. By making the assumption that the ions have an equilibrium distribution, the authors obtain the needed solutions as series with respect to time and complex exponentials. Also they indicate a new manner in which the solution may be obtained with any precision. A general form for density current is obtained. It should be noted that these results are obtained without any previous assumption being made on the temporal dependence of the distribution function. (9 refs.)

101387 Local temperature of a plasma corona. V.V.Aleksandrov, S.I.Anisimov, N.G.Koval'skii, A.M.Rubenchik, L.N.Shur.
JETP Lett. (USA), vol.37, no.2, p.81-4 (20 Jan. 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.2, p.68-70 (20 Jan. 1983).
The temperature of a laser plasma is usually determined from its X-ray emission. The electron temperature T_e found by this method, however, is an average over space and time, while one is often more interested in the local value of this temperature in the absorption zone. The authors show that the electron temperature in the absorption zone can be determined over a broad range of laser beam intensities by measuring the temporal profile of the emission at the $(3/2)\ \omega_0$ harmonic. (7 refs.)

101388 Fast annihilation of oppositely directed magnetic fields in a plasma. G.E.Vekshtein (Inst. of Nuclear Phys., Acad. of Sci., USSR).
JETP Lett. (USA), vol.37, no.2, p.84-8 (20 Jan. 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.2, p.70-3 (20 Jan. 1983).
The calculated rate at which oppositely directed magnetic fields annihilate is dramatically increased by incorporating the heat capacity and emission of the plasma. (4 refs.)

101389 Thermal relaxation in a strongly coupled two-temperature plasma. J.P.Hansen (Lab. de Phys. Theorique des Liquides, Univ. Pierre et Marie Curie, Paris, France), I.R.McDonald.
Phys. Lett. A (Netherlands), vol.97A, no.1-2, p.42-4 (8 Aug. 1983).
Thermal relaxation in a strongly coupled two-temperature plasma is investigated by computer simulation of a semi-classical model of a fully ionized hydrogen plasma. The estimated relaxation times are unexpectedly close to their Landau-Spitzer values. (4 refs.)

101390 Kinetic description of a relativistic plasma with a one-dimensional momentum distribution in initial state. A.B.Mikhailovskii, O.G.Onishchenko, A.I.Smolyakov (Space Res. Inst., Acad. of Sci., USSR).
Phys. Lett. A (Netherlands), vol.97A, no.3, p.103-4 (15 Aug. 1983).
A new kinetic description of a relativistic plasma in which the component of the momentum of the particles perpendicular to the magnetic field vanishes in the initial equilibrium state is proposed. The method is based on expressing the transverse momentum of a particle as a function of the coordinates, time and longitudinal momentum. (6 refs.)

101391 The measurement of large-scale density fluctuations in toroidal plasmas from the 'phase scintillation' of a probing electromagnetic wave. L.E.Sharp (Plasma Res. Lab., Australian Nat. Univ., Canberra, Australia).
Plasma Phys. (GB), vol.25, no.7, p.781-92 (July 1983).
The plasma electron density fluctuation spectrum can be obtained from the measurement of the phase fluctuation spectrum of a probing electromagnetic wave measured some distance from the plasma. If the mean square fluctuation of the probing beam is much less than unity and the observer-plasma distance is well within the Fresnel distance of the irregularities, a direct relationship exists between the density and phase spectra. As an example of this procedure, an experiment is described which uses a probing beam wavelength of 2 mm to measure the density irregularities. It is then proposed that a suitable wavelength for the present large toroidal plasma devices is in the 10 μm region. (14 refs.)

101392 Dynamic structure factors in two-component plasmas. R.Cauble (Berkeley Res. Associates, Springfield, VA, USA), D.B.Boercker.
Phys. Rev. A (USA), vol.28, no.2, p.944-51 (Aug. 1983).
The general kinetic equation for the charge-charge structure factor of a fully ionized strongly coupled hydrogen plasma is solved in three distinct collision approximations. The equilibrium correlation functions necessary to these solutions are provided by solution of the hypernetted-chain integral equations in which an effective pair potential has been used to take into account short-range quantum effects. The results are compared with molecular-dynamics simulations of the plasma using the effective potential and with a hierarchical approach involving known sum rules. (30 refs.)

52.25F Transport properties

101393 Fast-ion orbit effects during ion cyclotron range of frequency experiments on the Princeton large torus. R.Kaita, R.J.Goldston, P.Beiersdorfer, D.L.Herndon, J.Hosea, D.Q.Hwang, F.Jobes, D.D.Meyerhofer, J.R.Wilson (Plasma Phys. Lab., Princeton Univ., Princeton, NJ, USA).
Nucl. Fusion (Austria), vol.23, no.8, p.1089-92 (Aug. 1983).
The angular dependence of the flux of fast neutrals was measured in conjunction with ion cyclotron range of frequency experiments on the Princeton large torus. A regime was found where the energetic tail of the charge-exchange neutral flux was strongly anisotropic. Unexpectedly, however, the flux from co-going ions was peaked at an angle intermediate between perpendicular and parallel. This could be the consequence of a preferential filling of that class of banana orbits whose tips are located within the ion cyclotron resonance layer. (7 refs.)

101394 The effects of parallel viscosity on stationary convection in plasmas. R.B.Paris (Dept. de Recherches sur la Fusion Controlee, CEN, Fontenay-aux-Roses, France).
Phys. Lett. A (Netherlands), vol.96A, no.7, p.350-3 (18 July 1983).
Stationary convection in a simple cylindrical plasma model driven interchange-unstable by an applied heat source is considered in the presence of large parallel ion viscosity. The nature of the spectrum and the cellular convective pattern at marginal stability are quite different from that obtained using only perpendicular ion viscosity. (9 refs.)

101395 Effects of internal disruptions on impurity transport in Tokamaks. F.H.Seguin, R.Petrasso (American Sci. & Engng. Inc., Cambridge, MA, USA), E.S.Marmar.
Phys. Rev. Lett. (USA), vol.51, no.6, p.455-8 (8 Aug. 1983).
The effects of diffusion, convection, and internal disruptions on impurity profile evolution in Tokamaks are investigated by use of experimental measurements, numerical simulations, and a new analytic eigenfunction formalism for confinement times and profile shapes. Experimental observations on the Alcator-*C* Tokamak show that internal disruptions flatten radial profiles of impurity densities in the plasma core, and theoretical calculations indicate that periodic internal disruptions should significantly decrease impurity confinement times under some circumstances. (17 refs.)

101396 Penetration of oxygen in the edge region of Tokamak plasma. M.Tendler (Dept. of Plasma Phys. & Fusion Res., Royal Inst. of Technol., Stockholm, Sweden).
Plasma Phys. (GB), vol.25, no.7, p.767-79 (July 1983).
Transport of oxygen atoms and molecules in a two-component plasma is considered. It is shown that the oxygen atoms consist of some components. One of them has the penetration depth typical for the neutral hydrogen, while the other component has the penetration depth of the order of the total mean free path for the oxygen neutrals. The oxygen molecules desorbed from the wall are included, their influence on the impurity transport is studied. The diffusion coefficient of the first ionization state of the oxygen is estimated and is shown to be enhanced by one order of magnitude. Implications for Tokamak discharges are discussed. (22 refs.)

101397 Subclassical diffusion in the Coulomb regime and in toroidal geometry. R.Jones (Dept. of Phys., Nat. Univ. of Singapore, Singapore).
Plasma Phys. (GB), vol.25, no.8, p.901-10 (Aug. 1983).
Fast waves have been launched on a magnetized plasma column which was initially diffusing at the rate determined by classical Coulomb electron-ion collisions. As the injected wave amplitude is increased an energetic tail forms on the electron distribution and the crossfield particle diffusion coefficient declines to one quarter of its classical value. Similar experiments performemd in a toroidal octopole operated in the electron-neutral collision dominated regime have likewise yielded subclassical diffusion in closed toroidal geometry, the world record for plasma confinement. (19 refs.)

101398 Axisymmetric scrape-off plasma transport. C.E.Singer, W.D.Langer (Plasma Phys. Lab., Princeton Univ., Princeton, NJ, USA).
Phys. Rev. A (USA), vol.28, no.2, p.994-9 (Aug. 1983).
The two-dimensional flow of a collision-dominated hydrogen scrape-off plasma in an axisymmetric Tokamak is examined. This flow is described by a set of equations which contain the dominant terms in a maximal ordering appropriate to high-density experimental divertors and reactor scrape-off plasmas. Comparison of the theory to estimates of scrape-off parameters in the Doublet III expanded boundary plasmas suggests that analysis of classical and neoclassical processes alone may be sufficient to predict plasma transport in high-density scrape-off plasmas of practical importance. 52.25P Emission, absorption, and scattering of radiation

101399 Theory of radiation in an anisotropic plasma. P.C.W.Fung, T.P.Kwan (Phys. Dept., Univ. of Hong Kong, Hong Kong).
Astrophys. & Space Sci. (Netherlands), vol.93, no.2, p.281-93 (June 1983).
Follows up the work of Fung and Young (1982) to derive explicit expressions for the power emitted and the power observed per unit solid angle along the direction of the group velocity in an anisotropic plasma. The authors deduce the ratio of the time interval during which the energy is emitted and the corresponding time interval during which the energy is received in this anisotropic case. The result obtained is consistent to the basic well-known concept of group-ray propagation in a plasma. (10 refs.)

101400 Experimental evidence of X-ray line reabsorption in a laser plasma. M.Louis-Jacquet, P.Combis (Centre d'Etudes de Limeil, Villeneuve Saint Georges, France).
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.14, p.1019-22 (18 April 1983). In French.
By using a suitable target geometry, opacity of X-ray emission has been measured on an aluminium laser created plasma. By means of simple theoretical models optical depths are inferred and seem to be in accordance with Stark and Doppler line broadening. (7 refs.)

101401 Spectral line limiting and polarization shift in plasmas of high particle and energy density. B.I.Henry (Dept. of Theoretical Phys., Univ. of New South Wales, Kensington, Australia).
Laser & Part. Beams (GB), vol.1, pt.1, p.11-28 (Feb. 1983).
The change of the energetic quantum levels of electrons in atoms or ions within plasma due to the electrostatic energy of the Debye sphere is discussed on the basis of an electrostatic quantum model which permits an immediate, and therefore an integrated, inclusion of the Debye screening. The resulting Debye field leads to an alternative (temperature dependent) formulation of the Inglis-Teller Stark merging of spectral lines. In the new model the drowning of lines gives values closer to the Inglis-Teller limit than values given by the quantum approximation of the hydrogenic model. The straightforward calculation of the polarization shift based on the new model is closest to the experimental values and is between the very low values given by the semiclassical approach and the too high values given by the quantum approach of the hydrogenic effective charge model. (48 refs.)

101402 Spectral-line intensities of multiply charged Be-like ions in a high-temperature plasma. I.Yu.Skobelev, S.Ya.Khakhalin.
Opt. & Spectrosc. (USA), vol.54, no.1, p.13-16 (Jan. 1983). Translation of: *Opt. & Spektrosk. (USSR)*, vol.54, no.1, p.25-30 (Jan. 1983).
The processes by which the spectra of Be-like ions are excited in a high-temperature plasma are analyzed. The results of a numerical calculation of the density-sensitive relative intensities of the $2p^2$-$2s2p$ transitions in Ca XVII and Fe XVIII ions at densities and temperatures characteristic for a laser plasma are given. The theoretical and experimental data are compared, and it is shown that there is good agreement between them. (20 refs.)

101403 Radon inversion of plasma emission. D.N.Ghosh Roy (Dept. of Radiology, Univ. of Utah, Salt Lake City, UT, USA).
Phys. Lett. A (Netherlands), vol.96A, no.9, p.463-6 (1 Aug. 1983).
An analytical inversion of plasma spectral emission using the Radon transform is discussed for a plasma with a constant coefficient of absorption and a

model displaced gaussian as the spatial distribution of its coefficients of emission. (13 refs.)

52.30 PLASMA FLOW; MAGNETOHYDRODYNAMICS

(see also 47.65 Fluid dynamics)

101404 Compressible, conductive, steady MHD flow in a gravitational field. V.Osherovich (Space Environment Lab., NOAA/ERL, Boulder, CO, USA).
Astrophys. & Space Sci. (Netherlands), vol.93, no.2, p.221-8 (June 1983).
The magnetohydrodynamics of a compressible fluid with finite electrical conductivity in a gravitational field is treated analytically. For the case of one ignorable coordinate in cylindrical and Cartesian coordinates the problem is reduced to a scalar partial differential equation. The ideal gas equation of state is considered. For simplicity, the new equation is derived for a two-component motion. The application of this result to mass flow in sunspots is discussed. (18 refs.)

101405 The Knudsen ion layer problem in the theory of the collisionless sheath. I.B.Chekmarev, E.M.Sklyaroba, E.N.Kolesnikova (A.F. Ioffe Phys. Tech. Inst., Acad. of Sci., Leningrad, USSR).
Beitr. Plasma Phys. (Germany), vol.23, no.4, p.411-21 (1983).
The interaction of a partially ionized continuum gas with a negatively charged electrode is investigated theoretically. It is supposed that $l_d \ll 1$, where l_d is the Debye length, l is the mean-free-path. The self-consistent solution is given for two cases: $l_I \gg l$ and $l_I \sim l$, l_I is the effective ionisation length. The matched asymptotic expansions method is used. The Bohm sheath criterion is shown to be satisfied automatically in the considered cases. (14 refs.)

101406 Gas-dynamic proceses in a strongly radiation-heated layer of gas which accelerates a barrier. I.V.Nemchinov, V.M.Khazins.
Fluid Dyn. (USA), vol.17, no.6, p.922-7 (Nov.-Dec. 1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Zhidk. & Gaza*, vol.17, no.6, p.131-7 (Nov.-Dec. 1982).
Numerical methods involving two variables have been used to study gas-dynamic processes in a gas layer next to a barrier. A flow of gas arises because of absorption by the gas of intense radiation. It is shown that cumulative effects can occur leading to the establishment of a quasi-steady flow and heating regime if the radiation is applied for a prolonged period. (17 refs.)

101407 Spectrum of gas-dynamic perturbations and stability of a supersonic plasma flow in the presence of Joule heating. I.M.Rutkevich.
Fluid Dyn. (USA), vol.17, no.6, p.940-7 (Nov.-Dec. 1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Zhidk. & Gaza*, vol.17, no.6, p.154-62 (Nov.-Dec. 1982).
The author analyzes the perturbation spectrum for supersonic flow of a plasma heated by a current from an external source. In this case, the spectrum arises exclusively due to the influence of the external circuit. It is shown that when a current flows along a channel and there is a sufficiently rapid increase in the electrical conductivity with the temperature the steady current-voltage characteristic exhibits a section in which the voltage decreases with increasing current density. For perturbations that vary in time in accordance with the law exp λt and fixed gas-dynamic parameters at the entrance to the channel, the existence of a countable set of eigenvalues λ is established. (18 refs.)

101408 Microscopic derivation of plasma electro-hydrodynamics. G.L.Sewell (Dept. of Phys., Queen Mary Coll., London, England).
Phys. Lett. A (Netherlands), vol.97A, no.1-2, p.35-8 (8 Aug. 1983).
The authors present a new, essentially rigorous, method of deriving phenomenological electro-hydrodynamical equations of Euler and Maxwell from the Schrodinger equation for a quantum mechanical plasma. (5 refs.)

52.35 WAVES, OSCILLATIONS, AND INSTABILITIES IN PLASMA

101409 Stability of a self-gravitating partially ionized plasma. V.D.Sankhla, J.L.Bansal (Dept. of Math., Univ. of Jodhpur, Jodhpur, India).
Beitr. Plasma Phys. (Germany), vol.23, no.4, p.423-32 (1983).
The dynamic stability of a stratified layer of a partially ionized, self-gravitating plasma is studied to investigate the effects of finite electrical conductivity. The whole system is immersed in a uniform vertical magnetic field. It is first shown that the solution is characterized by a variational principle. An explicit solution has been then obtained for a semi-infinite composite plasma in which the density has a one-dimensional gradient along the vertical. Numerical calculations show that the influence of neutral gas friction and self-gravitation is stabilizing whereas character of finite electric conductivity is destabilizing. (18 refs.)

101410 Upper-hybrid solitons. B.K.Shivamoggi (Phys. Res. Lab., Ahmedabad, India).
Can. J. Phys. (Canada), vol.61, no.8, p.1205-11 (Aug. 1983).
Modulational instability and formation of envelope solitons of the upper-hybrid waves are considered. A more consistent calculation is given here which also includes the effect of ion inertia. A strong magnetic field can eliminate the existence of subsonic upper-hybrid solitons but can make possible the existence of supersonic upper-hybrid solitons. In order to describe the upper-hybrid solitons travelling at the speed of sound, the ion nonlinearity is included in the calculation with the assumpion of charge neutrality in the low frequency plasma response. An exact soliton solution moving at the speed of sound is then exhibited. Finally, a fully nonlinear theory of the formation of envelope solitons of upper-hybrid waves is given. The assumption of charge neutrality in the low frequency plasma response is abandoned. The solution shows a smooth transition from a single-hump soliton as the Mach number increases to unity. Furthermore, the dip at the centre for the double-hump soliton is found to become smaller as the magnetic field becomes stronger. (2 refs.)

101411 Experimental study of launched ion-acoustic waves in a plasma using continuous wave CO_2 laser scattering. P.Brodeur, H.W.H.Van Andel, D.C.Schram, V.M.M.Glaude (Dept. de Phys., Univ. de Montreal, Montreal, Quebec, Canada).
Can. J. Phys. (Canada), vol.61, no.8, p.1231-41 (Aug. 1983).
A study of coherent density fluctuations in a low density plasma using continuous wave CO_2 laser scattering diagnostics is reported. A simple and direct description of collective scattering theory from monochromatic electrostatic waves is presented. The diagnostic technique is described in detail and its performance is analyzed. Experimental results on externally launched ion-acoustic waves are presented and it is demonstrated that accurate measurements of certain plasma parameters are possible. (19 refs.)

101412 The effect of LH wave on the peripheral plasma of TM-1-MH Tokamak. J.Badalec, J.Datlov, K.Jakubka, V.Kopecky, S.Korbel, L.Kryska, P.Magula, J.Stockel, F.Zacek (Inst. of Plasma Phys., Czechoslovak Acad. Sci., Praha, Czechoslovakia), S.Nanobashvili.
Czech. J. Phys. Sect. B (Czechoslovakia), vol.B33, no.7, p.787-90 (1983).
The work is devoted to the study of the LH wave effect on the peripheral plasma of the TM-1-MH Tokamak. The observed enhancement of the ion saturated current in the limiter shadow is interpreted as heating of the peripheral ions by absorption of decay waves generated in this region due to the nonlinear wave-plasma interaction. (6 refs.)

101413 Kinetic description of propagation and absorption structures of ICRF waves. A.Fukuyama, S.Nishiyama (School of Engng., Okayama Univ., Okayama, Japan), K.Itoh, S.-I.Itoh.
Nucl. Fusion (Austria), vol.23, no.8, p.1005-16 (Aug. 1983).
Propagation and absorption of waves in the ion cyclotron range of frequencies (ICRF) are investigated using the kinetic theory in a high-temperature plasma. The wave equation which includes kinetic effects (such as finite-gyroradius effect and wave/particle interactions) is solved as a boundary-value problem for a two-ion-component plasma (majority deuterium and minority hydrogen) with one-dimensional inhomogeneities. The global structure of the wave field and the absorption mechanism are explained. The power deposition profile for each plasma species and the coupling to the antenna are obtained. The mode conversion of the fast wave to the ion Bernstein wave is associated with the two-ion hybrid resonance, and the latter is absorbed by electrons and deuterons via Landau damping and collisional damping, respectively. Protons absorb the wave which tunnels through the cut-off-layer (for strong-field-side excitations) by cyclotron damping. The existence of cavity resonances is also confirmed; these considerably influence the energy absorption. (16 refs.)

101414 Linear MHD stability studies of helically symmetric equilibria with HERA. P.Merkel, J.Nuhrenberg (Max-Planck-Inst. fur Plasmaphys., Garching, Germany), R.Gruber, F.Troyon.
Nucl. Fusion (Austria), vol.23, no.8, p.1061-7 (Aug. 1983).
Helically symmetric equilibria without net longitudinal current and their linear MHD stability are studied with the HASE quasi-analytical equilibrium code and the HERA 2D spectral code. The modes investigated comprise low-m-number internal, external, high-m-number modes obtained with the large-k-number option of the HERA code and localized ($k \rightarrow \infty$) ballooning modes. Stable straight Heliotron equilibria with beta up to $\langle\beta\rangle = 0.01$ and stable straight Heliac equilibria with beta up to $\langle\beta\rangle = 0.29$ are obtained. The correspondence between instability as obtained from the ballooning-mode equation in part of the plasma volume and from finite-k analysis is discussed. (20 refs.)

101415 Efficient parametric decay in dissipative media. K.Papadopoulos, K.Ko, V.Tripathi (Sci. Appl. Inc., McLean, VA, USA).
Phys. Rev. Lett. (USA), vol.51, no.6, p.463-6 (8 Aug. 1983).
Three-wave-coupling interactions have been examined for a dissipative medium. It is shown that in the semicollisional regime, where the frequency of the low-frequency wave (ω_3) is smaller than the collision frequency ν that affects the weakly damped high-frequency waves (ω_1, ω_2), i.e. $\omega_1, \omega_2 \gg \nu > \omega_3$, the thermal nonlinearity predominates and decay efficiencies in excess of that expected from the Manley-Rowe relations can be achieved. In addition, the pump threshold power for complete decay is substantially reduced. (12 refs.)

101416 Absolute parametric instabilities in inhomogeneous plasmas. G.Picard, T.W.Johnston (Inst. Nat. de la Recherche Sci. Energie, Univ. du Quebec, Varennes, Quebec, Canada).
Phys. Rev. Lett. (USA), vol.51, no.7, p.574-7 (15 Aug. 1983).
For one-dimensional three-wave parametric instabilities with oppositely directed group velocities for the decay waves in unbounded plasmas, it is known that for uniform coupling amplitude and constant wave-vector mismatch ($d\Sigma k_i/dx = \mathrm{const}$) there cannot be an absolute instability. It is shown that this is an exceptional case, and that in general an absolute instability can be obtained in an inhomogeneous plasma with a sufficiently strong pump. A simple criterion is given for the threshold of the absolute instability. (11 refs.)

101417 Comment on 'Collapse of longitudinal waves in a plasma [and reply]. K.Rypdal (Inst. for Math. & Phys. Sci., Univ. of Tromso, Tromso, Norway), J.J.Rasmussen, K.Thomsen, D.D.Tskhakaia.
Phys. Rev. Lett. (USA), vol.51, no.7, p.613-14 (15 Aug. 1983).
Taskhakaia (1982) claims to demonstrate that Langmuir-wave collapse as described by the Zakharov equations (1981) is two dimensional. First he derives a 'virial theorem' which has a useful form for collapse predictions for dimensionality $D=2$ only. Second, a self-similar transformation is performed, which is possible only for $D=2$. The authors have serious objections to both arguments. Tskhakaia responds by agreeing that the 'virial theorem' of his original paper does not deny, in general, the existence of three-dimensional collapse. However, until now no selfsimilar transformation satisfying the conservation laws in the three-dimensional case has been found. The selfsimilar solution used satisfies the laws in the two-dimensional case. (11 refs.)

101418 Fast and ion-cyclotron surface waves at a plasma-vacuum interface. N.F.Cramer (School of Phys., Univ. of Sydney, Sydney, NSW, Australia), I.J.Donnelly.
Plasma Phys. (GB), vol.25, no.7, p.703-12 (July 1983).
The effect of a finite frequency on the dispersion relation of low-frequency surface waves propagating on a magnetized plasma-vacuum interface is investigated. It is shown that two distinct modes exist depending on the sign of the wavenumber perpendicular to both the magnetic field direction and the normal to the surface, which may be related to the fast and ion-cyclotron body waves. The damping of these waves due to resonance absorption is calculated, and it is shown that the fast surface wave is undamped if its frequency is higher than the ion-cyclotron frequency. (17 refs.)

101419 Characteristics of the nonlinear suppression of ionization waves. H.Amemiya (Inst. of Phys. & Chem. Res., Saitama, Japan).
Plasma Phys. (GB), vol.25, no.7, p.735-54 (July 1983).
It is demonstrated that a spontaneously excited ionization wave in a small radius positive column is suppressed resonantly by an externally launched wave at some discrete frequencies. Waves whose frequency is not equal to these discrete frequencies have only a small effect of suppression. Results suggesting a feedback effect through the column are shown. It has been found that asynchronous quenching as described by van der Pol's equation should be modified. Also, the energy relation between the wave deviates from that given by van der Pol's relation. These characteristics are explained by considering nonlinearities of ionization rate and loss factor in Pekarek's equation. (41 refs.)

101420 Numerical calculation of Trivelpiece-Gould modes in a torus with circular cross-section. R.Keil (Inst. fur Informatik, Univ. Innsbruck, Innsbruck, Austria).
Plasma Phys. (GB), vol.25, no.8, p.841-54 (Aug. 1983).
The Trivelpiece-Gould modes in a quasielectrostatic approximation are calculated for a torus with circular cross-section. The results obtained with a Galerkin method are compared with those obtained for a torus with square cross-section. The lowest modes and eigenvalues are shown for aspect ratios varying from 2 to 5. (7 refs.)

101421 Coupled-mode equations for nonresonant interaction of high-frequency surface waves. N.Kostov, A.Shivarova (Faculty of Phys., Sofia Univ., Sofia, Bulgaria).
Plasma Phys. (GB), vol.25, no.8, p.891-900 (Aug. 1983).
Coupled-mode equations for the nonresonant interaction of two high-frequency surface waves, propagating along a plasma column bounded by vacuum, are derived directly by solving the equations of the one-fluid cold collisionless/collisional plasma model. The coupling coefficients are obtained in explicit form. The results are verified by analysing the simple case of harmonic generation by a high amplitude wave. The theory is extended to three-wave interaction in loss plasma in the general case of imperfect synchronism. (11 refs.)

101422 Electrostatic instabilities in a positive column. S.R.Sreenivasan, M.B.Schroeder (Dept. of Phys., Univ. of Calgary, Calgary, Alberta, Canada).
Plasma Phys. (GB), vol.25, no.8, p.925-35 (Aug. 1983).
A stability analysis of electrostatic perturbations in a positive column is reported. The positive column is considered as a three-component, low-pressure fluid, in which ionization and collisions play a significant role. The application of the generalized Hurwitz criterion for stability is found to predict an instability when the electron drift velocity exceeds 5/6 of the electron thermal velocity, in excellent agreement with experiments on current limitation in positive columns. (24 refs.)

101423 Nonlinearly evolved Faraday rotation due to strong radiation in a plasma. B.Chakraborty, Manoranjan Khan, B.Bhattacharyya (Dept. of Math., Jadavpur Univ., Calcutta, India).
Phys. Rev. A (USA), vol.28, no.2, p.1047-55 (Aug. 1983).
Faraday rotation (FR) has a nonlinear part which can be excited by a strong elliptically polarized electromagnetic wave in a plasma, even in the absence of a static magnetic field. It is due to the different dispersion rates of the strong left- and right-circular polarization components of the wave (the corresponding refractive indices are denoted by n_L and n_R) and induces weak nonuniformities in a magnetized plasma. As a result the study of the nonlinear characteristics requires the WKB type of nonlinearly correct first-harmonic field solutions. This nonlinear evolution problem has been investigated in this paper. The new results, depending on both the field intensity and the nonlinearly induced spatial inhomogeneity, are (1) the nonlinearly correct expressions for n_L and n_R, (2) the amplitude evolution equations in which the coefficients are slowly varying with respect to x (the Cartesian coordinate parallel to the direction of propagation) and their WKB solution, (3) the expression for the nonlinearly correct FR angle, and (4) a numerical estimation on the interaction of a plasma with a CO_2 pulsed laser in which it has been shown that the nonlinear increment of FR is opposite in sign to the value found in the linearized approximation of the field equations. The new results have been discussed in some special cases and some comments are given on enlarging the scope of further work on the FR of strong waves. (21 refs.)

101424 Properties of envelope solitons at the upper-hybrid layer. R.P.Sharma, P.K.Shukla (Inst. fur Theoretische Phys., Ruhr-Univ. Bochum, Bochum, Germany).
Phys. Rev. A (USA), vol.28, no.2, p.1182-5 (Aug. 1983).
Reports finite-frequency density modifications due to the electron Bernstein wave at the upper-hybrid resonant layer of a magnetoplasma. Envelope solitons consisting of nonlinear density perturbations together with localized Bernstein wave envelopes are found to exist. (16 refs.)

52.35R Plasma turbulence

101425 Coherence in chaos and caviton turbulence. G.D.Doolen, D.F.DuBois, H.A.Rose (Los Alamos Nat. Lab., Los Alamos, NM, USA), B.Hafizi.
Phys. Rev. Lett. (USA), vol.51, no.5, p.335-8 (1 Aug. 1983).
The chaotic nature of 'caviton turbulence' is studied in one-dimensional, many-Fourier-mode numerical simulations of the driven dissipative Zakharov equations. Above the modulational instability threshold the system evolves into a variety of stable patterns of cavitons which become chaotic for stronger driving. The cavitons remain coherent for times long compared to the shortest Lyapunov time. (5 refs.)

101426 Turbulent absorption of lower hybrid waves due to scattering by low frequency fluctuations. G.Bohm, H.Schluter, L.Schmitz (Inst. fur Experimentalphysik II der Ruhr-Univ. Bochum, Germany).
Plasma Phys. (GB), vol.25, no.8, p.911-23 (Aug. 1983).
Wave absorption in the range of the lower hybrid frequency ($\omega_{LH} \leq \omega_0 \leq 3\omega_{LH}$, $P_{RF} \leq 1$ kW) is investigated in a 1=2 toroidal stellarator with very low shear ($B_t \leq 0.3$ T, $\theta \leq 0.05$). The target plasma is produced at the electron cyclotron frequency ($\omega_{ce}/2\pi \simeq 7.8$ Gc). After application of the RF-heating pulse, a fast rise of the electron and ion temperature within a few μs is found regardless of the presence of a linear turning point ($\omega \simeq \omega_{LH}$) in the plasma. Strong scattering of the incident LH-wave by low frequency density fluctuations ($\omega_L \ll \omega_{ci}$, $\delta n/n \leq 0.4$) of the target plasma is observed. Correlation measurements of the $k_\parallel$-and $k_\perp$-spectrum of the low frequency density fluctuations as well as the scattered lower hybrid spectrum are presented. Several indications for turbulent particle heating are found. The effective collision frequencies necessary to explain the observed particle heating are calculated from the plasma energy balance. (13 refs.)

52.35T Shock waves

101427 Interaction of a converging cylindrical shock wave with a transverse magnetic field for large magnetic Reynolds numbers. D.A.But, S.M.-A.Koneev.
Magnetohydrodynamics (USA), vol.18, no.4, p.389-95 (Oct.-Dec. 1982). Translation of: *Magn. Gidrodin. (USSR)*, vol.18, no.4, p.69-75 (Oct.-Dec. 1982).
The authors study the interaction between a conducting gas and a magnetic field behind a converging cylindrical shock wave in the presence of strong magnetohydrodynamic interaction and the influence of induced magnetic fields. (10 refs.)

Shock waves excited by a fast charged beam in media with dissipation .... See Entry 101439

52.40 PLASMA INTERACTIONS

52.40D Electromagnetic wave propagation in plasma

101428 Current responses of first and second order in a collisionless plasma. III. Three-wave interaction in periodic plasma. J.Larsson (Dept. of Plasma Phys., Umea Univ., Umea, Sweden).
J. Math. Phys. (USA), vol.24, no.8, p.2222-30 (Aug. 1983).
For pt.II see ibid., vol.23, p.183 (1982). Three-wave interaction in a possibly strongly inhomogeneous plasma was considered in Paper II. These results are now generalized in order to treat also time-dependent periodic systems. The coupled mode equations as given in this paper are applicable to a very large class of unperturbed systems including those in Paper II and plasmas with self-consistence or in external oscillating fields and also plasmas with some crystal symmetry in space-time. In the particular case when the relativistic Vlasov equation is used to describe the plasma the author gives symmetric expressions for the coupling coefficients such that the Manley-Rowe relations follow if wave-particle interaction is neglected. (10 refs.)

101429 Current responses of first and second order in a collisionless plasma. IV. Applications. J.Larsson (Dept. of Plasma Phys., Umea Univ., Umea, Sweden).
J. Math. Phys. (USA), vol.24, no.8, p.2231-9 (Aug. 1983).
For pt.III see ibid., vol.24, no.8, p.2222-30 (1983). The purpose of this paper is to illustrate with a few concrete examples how the general formulas given in the preceding papers I-III may be used. The author considers three different background plasmas: a homogeneous static magnetized plasma, a homogeneous magnetized plasma in an oscillating electric field, and a semi-infinite homogeneous static magnetized plasma. The coupled mode equations governing resonant three-wave interaction are given in each case. (21 refs.)

101430 The study of Nd-glass laser radiation influence upon the plasma generated in a plasma-focus device. S.Denus, J.Chlodzinski, L.Pokora, T.Pisarczyk, M.Scholz, W.Skrzeczanowski, R.Socha, A.Szydlowski, J.Wolski.
J. Tech. Phys. (Poland), vol.23, no.2, p.153-65 (1982).
The plasma-focus (PF) systems are among the systems intended to be used for the accomplishment of nuclear fusion. The achievement of the ultimate aim is likely to be hastened by the possibility of heating up the focus plasma

with laser radiation. The interaction of CO_2 laser, of maximum energy 200 J and pulse width about 100 ns, with the plasma generated in a PF device of nominal charging energy $E_n=150$ KJ has been studied. The results of these studies are indicative of the complete absorption of laser radiation, and of double increase of neutron yield at discharges with laser. (14 refs.)

101431 On mechanisms of anomalous absorption of electromagnetic waves near a critical point of a plasma target. L.M.Degtyarev, A.S.Reztsov, R.Z.Sagdeev, V.D.Shapiro, V.I.Shevchenko (Space Res. Inst., Acad. of Sci., Moscow, USSR).
Phys. Lett. A (Netherlands), vol.96A, no.7, p.354-7 (18 July 1983).
Anomalous absorption of a strong P-polarized electromagnetic waves is studied by a numerical technique near a critical point of a plasma target $n_c=m\omega^2/4\pi e^2$. It is shown that three absorption regimes can be implemented depending on the incident wave amplitude and the angle of incidence: linear transformation into plasma oscillations, transformation of the modified density profile, and absorption due to the strong plasma turbulence excited near the plasma resonance. (3 refs.)

101432 Stimulated Raman and Brillouin scattering of a Gaussian electromagnetic beam in ordinary mode in a magnetoplasma. M.S.Sodha, K.Ramamurthy, P.K.Malhotra, R.P.Sharma (Centre of Energy Studies, Indian Inst. of Technol., New Delhi, India).
Phys. Rev. A (USA), vol.28, no.2, p.1098-102 (Aug. 1983).
Presents an investigation of the interaction of a high-power Gaussian electromagnetic beam in ordinary mode with the electrostatic modes of the plasma and the resulting Raman and Brillouin scattering process. Taking into proper account the nonuniformity of the pump Gaussian beam, the authors have derived the expressions for the spatial amplification factor and temporal growth rate within the WKB and paraxial-ray approximations for stimulated Raman and Brillouin scattering. The effect of the nonuniformity of the pump is seen to affect the scattering phenomena significantly. (9 refs.)

101433 Weak monotonic double layers. K.Y.Kim (ERL, Univ. of California, Berkeley, CA, USA).
Phys. Lett. A (Netherlands), vol.97A, no.1-2, p.45-50 (8 Aug. 1983).
The authors present analytic evidence for the existence of small amplitude electron and ion monotonic double layers. These are the nonlinear extensions of the slow electron acoustic wave and the slow ion acoustic wave, respectively: one related to the electron solitary hole (electron phase space vortex), the other related to the ion acoustic solitary hole (ion phase space vortex), both having negative trapping parameters. 101434 Brillouin backscattering in an electron beam-plasma system. J.E.Willett, Y.Aktas (Dept. of Phys., Univ. of Missouri-Columbia, Columbia, MO, USA).
Plasma Phys. (GB), vol.25, no.7, p.819-25 (July 1983).
The stimulated Brillouin backscattering of an intense electromagnetic wave propagating in a plasma traversed by an electron beam is investigated. A dispersion relation for the unstable backscattered electromagnetic wave and ion-acoustic scatterer wave in the presence of the pump wave is derived. Formulas are then obtained for the growth rate of the unstable waves and the threshold power of the pump wave required to excite the parametric instability. The results of a numerical study indicate that the electron beam can have a substantial effect on the threshold and growth rate. (4 refs.)

101435 Filamentation and magnetic field generation by charged particle beams in laser produced plasmas. Yu.M.Aliev, V.Yu.Bychenkov, A.A.Frolov (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Plasma Phys. (GB), vol.25, no.8, p.827-31 (Aug. 1983).
The kinetic electromagnetic instability caused by collisionless dissipation under anomalous skin-effect conditions is investigated in plasma penetrated by fast electron beams. Characteristic scales of rising periodical current structure are determined and magnitude of the generated magnetic field is estimated. (5 refs.)

101436 On the nonlinear theory of surface wave generation in an electron beam-plasma system. V.K.Grishin (Inst. of Nuclear Phys., Moscow State Univ., Moscow, USSR), S.T.Ivanov, M.F.Kanevsky.
Plasma Phys. (GB), vol.25, no.8, p.855-64 (Aug. 1983).
The nonlinear interaction of a relativistic charged beam with the surface wave excited when the beam slides along a plasma layer is considered. The self-consistent nonlinear state of the wave-beam system has been analyzed on the basis of the Maxwell and kinetic equations. The saturation amplitude, wave-phase velocity, the wave generation efficiency, and other quantities have been obtained as a function of the initial parameters of the system. (17 refs.)

101437 Nonlinear equilibrium state of relativistic electron beam and EM waves of large amplitude in a plasma. S.T.Ivanov (Faculty of Phys., Sofia Univ., Sofia, Bulgaria), K.A.Reshetnikova.
Plasma Phys. (GB), vol.25, no.8, p.865-74 (Aug. 1983).
Using the Maxwell and relative hydrodynamics equations, the equilibrium wave-beam in a plasma has been analyzed and considered, provided that the wave is purely harmonic. Taking into account the equilibrium of pulse and energy conservation law, the nonlinear characteristics of the system have been obtained for a large wave amplitude (the beam and plasma are nonlinear). Redistribution of the beam kinetic energy and the dependence of the generation efficiency on the parameters of the system have been investigated and studied. (15 refs.)

101438 Two-dimensional model of the interaction of a relativistic electron beam with the fields excited in a plasma. O.I.Klimov, Ye.I.Ostrenskiy.
Radio Eng. & Electron. Phys. (USA), vol.27, no.10, p.126-32 (Oct. 1982). Translation of: *Radiotekh. & Elektron. (USSR)*, vol.27, no.10, p.2001-7 (Oct. 1982).
A two-dimensional self-consistent model has been developed for the interaction of a relativistic electron beam with the fields excited during injection of the beam into a plasma. The obtained equations can be used to study the nonlinear interaction of magnetized (one-dimensional) as well as nonmagnetized electron beams with the plasma. The two-dimensional dynamics of the electron beams in the collective electric field of the space charge and the intrinsic magnetic field are calculated. (13 refs.)

101439 Shock waves excited by a fast charged beam in media with dissipation. V.K.Grishin, A.A.Kolomenskii.
Sov. Phys.-Lebedev Inst. Rep. (USA), no.10, p.35-40 (1982). Translation of: *Sb. Kratk. Soobshch. Fiz. AN SSSR Fiz. Inst. P.N. Lebedeva*, no.10, p.40-5 (1982).
The authors consider an electromagnetic wave with shock front, excited by a fast beam of charged particles in plasma media with dissipation. A self-consistent nonlinear analysis determines the nature of the particle distribution in the beam, and the structure of the shock wave. (3 refs.)

52.50 PLASMA PRODUCTION AND HEATING

101440 Quasilinear theory of cyclotron heating of plasma in toroidal systems by monochromatic radiation. E.V.Suvorov, M.D.Tokman (inst. of Appl. Phys., Acad. of Sci., Gorky, USSR).
Plasma Phys. (GB), vol.25, no.7, p.723-34 (July 1983).
Averaged equations are obtained for electron motion under cyclotron resonance conditions in the electromagnetic field of the ordinary wave of finite amplitude for the case of quasi-transverse propagation. The characteristic time intervals are pointed out, for which the wave-electron interaction is essentially different in the initial problem. The conditions are given under which this interaction is determined by the linear theory. Taking into account the rotational transform in toroidal systems, a quasilinear equation for the evolution of the electron distribution function is obtained, which is equivalent to that describing a heating in the h.f. field with a noise spectrum. The optical plasma depth for an ordinary wave is shown to remain constant during the course of quasilinear relaxation. (8 refs.)

101441 Coupling between ECRH-driven and ohmic plasma currents. D.F.H.Start (Culham Lab., UKAEA, Abingdon, England).
Plasma Phys. (GB), vol.25, no.7, p.793-8 (July 1983).
A Fokker-Planck calculation of the interaction between ECRH-driven and ohmic currents is presented. For high values of the parallel velocity of the resonant electrons, the current driven by electron cyclotron resonance heating is found to be substantially enhanced as a result of the distortion of the electron distribution function due to the electric field. The increase in current results principally from the increase in the number of resonant electrons. For absorption by resonant electrons of low parallel velocity the electron cyclotron heating reduces the ohmic current. (11 refs.)

101442 Self-organization phenomena in the plasma focus. R.Deutsch, W.Grauf, H.Herold, H.Schmidt (Inst. fur Plasmaforschung, Univ. Stuttgart, Stuttgart, Germany).
Plasma Phys. (GB), vol.25, no.8, p.833-40 (Aug. 1983).
The structure of the final minimum-energy state of the focus plasma was studied, using Taylor's relaxation theory (1974). A superposition of the reversed pinch field and the field of eddies was obtained. Similar structures could be observed experimentally. (8 refs.)

101443 Non-ideal plasmas of metal vapours. V.A.Alekseev (I.V. Kurchatov Inst. of Atomic Energy, Moscow, USSR), I.T.Iakubov.
Phys. Rep. (Netherlands), vol.96, no.1, p.1-69 (June 1983).
Non-ideal plasmas of metal vapours are created at a compression of gaseous weakly conductive plasmas in the course of their transition into the liquid-metal state. In this situation the interaction between the charged particles (electrons and ions) and the neutral atoms become important. The interaction energy is exceeding the kinetic energy. A result of this process is a radical change of the particle states: a lowering of the atomic ionization potential and a deformation of the atomic spectra, a formation of electronic and ionic clusters. This leads to an essential change in the matter properties, such as the electric conductivity, the optical absorption, the thermoelectric power etc. (158 refs.)

52.50J Plasma production and heating by laser beams

101444 Laser driven compression experiments using low X-ray opacity polymer shells. J.D.Kilkenny, B.J.MacGowan (Blackett Lab., Imperial Coll. of Sci. & Technol., London, England), P.T.Rumsby.
Appl. Phys. Lett. (USA), vol.43, no.3, p.233-5 (1 Aug. 1983).
The use of polymer shells, filled with dichlorodifluoromethane in laser compression experiments is described. The absence of shell emission leads to chlorine spectra with little contaminating shell continuum emission. The low X-ray opacity of polymer indicates that chlorine heliumlike emission could be detected even with compressed shell areal density of 0.1 gm cm^{-2}. (9 refs.)

101445 Self-consistent calculations of short-pulse laser-heated plasma dynamics. P.Ladrach, J.Balmer (Inst. of Appl. Phys., Univ. of Bern, Bern, Switzerland).
Laser & Part. Beams (GB), vol.1, pt.1, p.67-79 (Feb. 1983).
A one-dimensional, time-dependent fluid code is presented that numerically solves the hydrodynamic equations together with the wave equation for a picosecond pulse laser heated plasma. The laser light absorption by classical inverse bremsstrahlung and the ponderomotive force are evaluated self-consistently from the computed electromagnetic field quantities. At oblique incidence of *p*-polarized 1.054 μm laser radiation the resonant electric field is saturated by plasma wave convection through the nonlinear density profile steepening prior to wave breaking. (20 refs.)

101446 Dependence of lateral energy transport on laser irradiance in laser-induced plasmas. S.Sharma, B.Moncef, H.C.Pant (Laser Section, Bhabha Atomic Res. Centre, Bombay, India).
J. Appl. Phys. (USA), vol.54, no.8, p.4666-7 (Aug. 1983).
An experimental study of lateral energy transport in laser-produced plasmas is presented. X-ray pinhole photography has been used for studying the variation of the plasma diameters at the target surface as a function of the laser intensity. A scaling law has been found for this variation. (15 refs.)

101447 Return-current heating and implosion of cylindrical CO$_2$-laser-driven targets. A.Hauer, R.J.Mason (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA).
Phys. Rev. Lett. (USA), vol.51, no.6, p.459-62 (8 Aug. 1983).
The Helios laser system has been used to deliver 2.3 kJ to the capped end of 0.75-mm-long, 130-μm-diam hollow rods of 5-μm wall thickness. Soft-X-ray pinhole pictures demonstrate the cylindrical implosion of these targets. The measured 130-eV core temperatures from the filtered pictures and the 7×10^6-cm/s collapse velocity from optical streak photographs are consistent with heating by a 0.8×10^6-A return current, representing the recycling of 15% of the hot-electron emission. (10 refs.)

101448 Double-shell-target implosion by four beams from the GEKKO IV laser system. Y.Kitagawa, N.Miyanaga, H.Hama, T.Yabe, K.Fujiwara, Y.Kawai, M.Nakatsuka, T.Norimatsu, Y.Izawa, T.Yamanaka, C.Yamanaka (Inst. of Laser Engng., Osaka Univ., Osaka, Japan).
Phys. Rev. Lett. (USA), vol.51, no.7, p.570-3 (15 Aug. 1983).
A double-shell-target implosion was studied with the GEKKO IV glass-laser system. The inner-shell trajectory, recorded for the first time by a newly developed two-frame X-ray shadowgraphy technique, was analyzed by a self-similar flow model, implying more than 20% outer-inner kinetic-energy conversion. The trajectory also agreed with a one-dimensional code result including a vacuum insulation effect. A two-dimensional particle-in-cell simulation analyzed the illumination nouniformity printed on the inner shell. (16 refs.)

101449 Detailed observation and analysis of radiation from high-density laser-imploded targets. A.Hauer (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA).
Phys. Rev. A (USA), vol.28, no.2, p.963-75 (Aug. 1983).
High-energy CO$_2$-laser radiation has been used to implode gas-filled spherical targets to very high densities ($10^{23}<n_e<10^{24}$ cm^{-3}) and temperatures ($\sim$800 eV). The imploded gas was composed primarily of DT with a small amount of argon seed. The detailed observations of radiation from the argon was a primary diagnostic of the imploded-plasma conditions. An extensive analysis of the emitted argon spectrum provides a rich source of information on plasma parameters. In most cases one could not assume local-thermodynamic-equilibrium conditions. A very detailed collisional-radiative model was constructed in order to analyze the spectrum. In view of the complexity of the calculations that had to be performed and the care needed in data acquisition and processing, the agreement between theory and experiment was very good. (43 refs.)

101450 Investigation of soft X-ray population inversion in laser produced plasmas. Xu Zhizhan, Yin Guangyu (Shanghai Inst. of Optics & Fine Mech., Acad. Sinica, Shanghai, China).
Sci. Sin. (China), vol.26, no.6, p.657-65 (June 1983).
The authors have observed spectroscopic evidence for the population inversion between $n=3$ $n=4$ levels of Mg^{+10} ions in a laser target experiment where a given high power time-structured pulses were used. There are population inversions not only in the expansion plume region far from the target but also in the high electron density region near the target surface. It has been shown that the laser produced plasmas both temporally and spatially involve the 'overheated' and 'supercooled' conditions significantly deviated from the ionization equilibrium owing to the presence of prepulse, then two categories of temporal and spatial regions characterized by the population inversion are evolved. (14 refs.)

101451 Ionization equilibrium in laser plasma. I.L.Beitman, A.E.Stepanov.
Sov. Phys.-Lebedev Inst. Rep. (USA), no.10, p.6-11 (1982). Translation of: *Sb. Kratk. Soobshch. Fiz. AN SSSR Fiz. Inst. P.N. Lebedeva*, no.10, p.8-14 (1982).
The authors solve the kinetic problem of formation of the ionization equilibrium in a laser plasma. The experimental data for the Fe XXI-Fe XXV ions are described by using a gas-dynamic spherical corona model of the laser targets. (8 refs.)

52.50L Plasma production and heating by shock wave and wire explosion

101452 Two-dimensional numerical simulation of an inductively driven imploding foil plasma. B.J.Kohn, N.F.Roderick, C.W.Beason (Air Force Weapons Lab., Kirtland Air Force Base, NM, USA).
J. Appl. Phys. (USA), vol.54, no.8, p.4348-53 (Aug. 1983).
A 1.9-MJ capacitor bank with intermediate inductive energy storage for pulse shortening has been used to implode a thin cylindrical sheath in a *z*-pinch geometry. Theoretical investigations of two-dimensional axisymmetric effects in the *r-z* plane, which lead to a thickening of the sheath, have been made using a two-dimensional magnetohydrodynamics code. The results of several calculations are presented which demonstrate how imperfections in the initial sheath geometry affect development of the acceleration-driven magnetohydrodynamic Rayleigh-Taylor instability. (6 refs.)

101453 Numerical modelling of an explosion plasma generator, taking into account radiative energy transport and evaporation of the walls. G.S.Romanov, V.V.Urban (V.I. Lenin Sci.-Res. Inst. of Appl. Phys. Problems, State Univ., Minsk, Belorussian SSR).
J. Eng. Phys. (USA), vol.43, no.6, p.1418-25 (Dec. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.6, p.1012-20 (Dec. 1982).
Using a generalized theoretical model, the authors study the effect of geometrical dimensions and a variety of physical processes on the operation of the explosion plasma generator. (18 refs.)

52.55 PLASMA EQUILIBRIUM AND CONFINEMENT

101454 On the size of the plasma region. C.Bandle (Math. Inst., Univ. Basel, Basel, Switzerland), M.Marcus.
Appl. Anal. (GB), vol.15, no.1-4, p.207-25 (1983).
A simple model for the shape at equilibrium of a confined plasma is presented. The authors consider the variational solutions under assumptions of a free boundary, and derive asymptotic estimates for the size of the plasma domain. (8 refs.)

101455 Strong ion coupling effects at high density of inertial confinement fusion plasmas. K.I.Golden (Dept. of Electrical Engng., Northeastern Univ., Boston, MA, USA).
Laser & Part. Beams (GB), vol.1, pt.1, p.3-9 (Feb. 1983).
Strong ion coupling effects could play an important role in laser—and particle beam—compressed ICF layered targets. Some light is shed on these effects by examining structure and pair correlation functions calculated from some of the well known strongly coupled plasma approximation schemes.

101456 Inertial confinement fusion research by particle beams at ILE Osaka. S.Nakai, K.Imasaki, S.Miyamoto, S.Higaki, T.Ozaki, A.Yoshinouchi, H.Fujita, K.Mima, K.Nishihara, T.Yabe, S.Ido, Y.Ohgaki, C.Yamanaka (Inst. of Laser Engng., Osaka Univ., Suita, Osaka, Japan).
Laser & Part. Beams (GB), vol.1, pt.1, p.29-65 (Feb. 1983).
The analysis of key issues based on the conceptual design of a reactor and the investigations by experimental, theoretical and computational methods have revealed the feasibility of LIB-ICF (light ion beam-inertial confinement fusion) and the objectives for R&D. A pulse power generator with MJ output is well within present technology. Research on the pellet implosion physics is progressing in the laser fusion and shows high potential and the required conditions for ICF by pellet implosion. The experimental results on the deposition of ion beam energy on target and the generation of ablation pressure, together with the progress on implosion physics by lasers, seem to show the LIB to be a possible alternative driver to the laser. The basic conditions to be achieved for the inertial fusion application of LIB are power concentration in time and space, to the required level of 10^{14} W/cm^2, and beam transport without loss of concentration over the distance of a reactor size of order 3$\sim$5 m. (51 refs.)

101457 Impurity transport and plasma rotation in the ISX-B Tokamak. R.C.Isler, L.E.Murray, E.C.Crume, C.E.Bush, J.L.Dunlap, P.H.Edmonds, S.Kasai, E.A.Lazarus, M.Murakami, G.H.Neilson, V.K.Pare, S.D.Scott, C.E.Thomas, A.J.Wootton (Fusion Energy Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
Nucl. Fusion (Austria), vol.23, no.8, p.1017-37 (Aug. 1983).
Recent calculations have shown that when external momentum sources and plasma rotation are included in the neoclassical theory, the standard results for impurity transport can be strongly altered. Under appropriate conditions, inward convection is reduced by co-injection and enhanced by counter-injection. In order to examine the theoretical predictions, several observations of impurity transport have been made in the ISX-B Tokamak during neutral-beam injection for comparison with the transport seen with Ohmic heating alone. Both intrinsic contaminants and deliberately introduced test impurities display a behaviour that is in qualitative agreement with the predicted beam-driven effects. These correlations are particularly noticeable when the comparisons are made for deuterium where the impurity transport in the Ohmically heated discharges exhibits neoclassical-like characteristics, i.e. accumulation and long confinement times. Similar but smaller effects are observed in beam-heated hydrogen discharges; neoclassical-like behaviour is not seen in Ohmically heated hydrogen sequences. Emphasis has been placed on measuring toroidal plasma rotation, and semi-quantitative comparisons with the theories of beam-induced impurity transport have been made. It is possible that radial electric fields other than those associated with momentum transfer and increased anomalous processes during injection could also play a role. (33 refs.)

101458 Closed expressions for the magnetic field of toroidal multipole configurations. G.V.Sheffield (Plasma Phys. Lab., Princeton Univ., Princeton, NJ, USA).
Nucl. Fusion (Austria), vol.23, no.8, p.1039-42 (Aug. 1983).
Closed analytic expressions for the vector potential and the magnetic field for the lower-order toroidal multipoles are presented. These expressions can be applied in the study of Tokamak plasma cross-section shaping. An example of such an application is included. These expressions also allow the vacuum fields required for plasma equilibrium to be specified in a general form, independent of a particular coil configuration. (6 refs.)

101459 Radial and axial losses in a multiple-mirror experiment. H.D.Price, A.J.Lichtenberg, M.A.Lieberman (Dept. of Electrical Engng., Univ. of California, Berkeley, CA, USA), M.Tuszewski.
Nucl. Fusion (Austria), vol.23, no.8, p.1043-52 (Aug. 1983).
Plasma confinement is studied experimentally in the Berkeley Ten Meter Multiple-Mirror Device. Stability is achieved by a set of linked quadrupoles which produce an average minimum-B field configuration. The density decay is measured from the high-density regime ($10^{13}<n<10^{15}$ cm^{-3}) dominated by radial loss through the multiple-mirror regime ($10^{11}<n<10^{13}$ cm^{-3}) for which either axial or radial loss may be more important. The effect of mirror ratio ($2\leq M\leq 4$) and magnetic field strength ($1.1\leq B_0\leq 2.1$ kG) on plasma loss is investigated. The observed confinement times are predicted reasonably well by an analytical estimate and by a numerical simulation. Each calculation accounts for axial and radial loss due to classical processes only, with the radial diffusion enhanced by the highly eccentric elliptical flux surfaces. A multiple-mirror normal mode is achieved with centre-cell density in the range $n\approx 10^{12}$ cm^{-3} and with axial profiles in qualitative agreement with those predicted by the numerical simulation. The results indicate that the confinement in a stabilized multiple-mirror can be governed by classical collisions alone. (9 refs.)

101460 Effect of the ambipolar potential on stellarator confinement. H.E.Mynick, W.N.G.Hitchon (Torsatron/Stellarator Lab., Univ. of Wisconsin, Madison, WI, USA).
Nucl. Fusion (Austria), vol.23, no.8, p.1053-9 (Aug. 1983).
The confinement properties of reactor-scale stellarators in the presence of a self-consistent ambipolar potential Φ are examined in the light of the current theoretical expectations for the dependence of the transport coefficients on collisionality and radial electric field. Stellarators have sufficiently good confinement to be viable as reactors. In addition, multiple roots of the ambipolarity constraint can exist in stellarators (as in other devices) and, for appropriate parameters, confinement can be improved by operating at a root different from the one usually considered. (9 refs.)

101461 Plasma equilibrium equation for a stellarator of arbitrary aspect ratio. V.D.Pustovitov (I.V. Kurchatov Inst. of Atomic Energy, Moscow, USSR).
Nucl. Fusion (Austria), vol.23, no.8, p.1079-88 (Aug. 1983).
In reducing the three-dimensional plasma equilibrium equations for a stellarator to two-dimensional form (a single scalar equation or a system of vector equations), the aspect ratio A is usually considered to be large and an expansion is performed in A^{-1}. A two-dimensional scalar equation is derived for plasma equilibrium, with accurate allowance for toroidality and without expansion in A^{-1}, so that it can also be used to describe compact small-aspect-ratio stellarators, e.g. systems of the stellatron type. The analysis is performed by the method of inversion of variables, and the result is a complete three-dimensional description of the equilibrium configuration. (23 refs.)

101462 Particle loss from an electron cyclotron resonance discharge plasma in the WT-2 device. S.Nakao, K.Ogura, Y.Terumichi, S.Tanaka (Dept. of Phys., Faculty of Sci., Univ. of Kyoto, Kyoto, Japan).
Phys. Lett. A (Netherlands), vol.96A, no.8, p.405-8 (25 July 1983).
The dominant particle loss from an electron cyclotron resonance discharge plasma in a simple toroidal configuration is ascribed to the $E\times B$ drift due to the vertical electric field produced by the electrons' toroidal drift. The electron density is increased by adding a small vertical field. This is explained by the electron flow along the line of force canceling the toroidal drift, resulting in reduction of the $E\times B$ drift. (7 refs.)

101463 Experimental observation on sloshing-ion distribution and ass ciated potential-dip formation. K.Yatsu, H.Tamai, M.Hoshino, Y.Kusam Y.Kiwamoto, Y.Kiyohara, A.Sakasai, I.Wakaida, M.Inutake, K.Sawa S.Miyoshi (Plasma Res. Center, Univ. of Tsukuba, Ibaraki, Japan).
Phys. Rev. Lett. (USA), vol.51, no.5, p.388-91 (1 Aug. 1983).
The sloshing-ion density distribution is produced in one of the minim-B mirrors of GAMMA 6 by injection of neutral beams at 62° to the axis he formation of sloshing ions is confirmed by pitch-angle distributions meared with secondary emission detector arrays and a gridded energy analyzer dip of plasma potential is observed associated with the density minimumf the sloshing-ion distribution. (10 refs.)

101464 Nuclear spin-polarized fuel in inertial fusion. M.More (Lawrence Livermore Nat. Lab., Livermore, CA, USA).
Phys. Rev. Lett. (USA), vol.51, no.5, p.396-9 (1 Aug. 1983).
Examines the possibility of using spin-polarized DT fuel f inertial-confinement fusion. Analytic models and estimates are developed determine whether an initial spin-polarized state would survive target irdiation and implosion. It is found that collisional depolarization cross seons are not large enough to give significant depolarization, and that the sht duration of inertial-fusion implosions precludes spin resonance for magnetields that can be reasonably expected in the target fuel. (12 refs.)

101465 Non-Maxwellian ion distributions caused by neossical heat conduction. A.A.Ware (Inst. for Fusion Studies, Univ. of Tas, Austin, TX, USA).
Phys. Rev. Lett. (USA), vol.51, no.5, p.400-3 (1 Aug. 1983.
It is shown that in Tokamaks with neoclassical banana-ime heat conduction and ion self-collisions dominant for energy scatteringhe distribution tail diffuses outwards radially and downwards in energy mtaining a constant effective temperature $(-\partial \ln f_i/\partial\epsilon)^{-1}$, as observed in sie experiments. (9 refs.)

101466 Effects of nonadiabaticity on applicationsf the ponderomotive force near gyroresonance. G.Dimonte, B.M.Lamb, J.Morales (Dept. of Phys., Univ. of California, Los Angeles, CA, USA).
Plasma Phys. (GB), vol.25, no.7, p.713-22 (July 1983
The enhancement of the ponderomotive potential negyroresonance is investigated both experimentally and theoretically. Duto nonadiabaticity the maximum value of the ponderomotive potential is ited by the transit time of the particle through the r.f. field structure. T results have important implications for isotope separation and r.f. plugg of fusion plasmas. (12 refs.)

101467 Application of Epstein technique to dy the coupling properties of an ICRH antenna. R.P.Bhatnagar, V.P.Bhatnar, R.Koch, R.R.Weynants (Lab. de Phys. des Plasmas, Ecole Royale Milite, Brussels, Belgium).
Plasma Phys. (GB), vol.25, no.7, p.755-65 (July983).
An analytic solution of the wave equation foan inhomogeneous Tokamak plasma is obtained in terms of hypergeometric nctions by fitting the Epstein profile, with a maximum of five free pararers, to the dispersion curve. Power radiated from an ICRH antenna is th evaluated by solving a boundary value problem. The radiation resistancend inductance obtained by this method are compared in a particular case, fillustration, with those employing numerical integration and are found to typically 10% higher. Replacing the numerical integrn by the curve fitting procedure in the plasma region, a considerable savinf computer time can be achieved. (18 refs.)

101468 Charactstics of the magnetic field fluctuations in the ETA-BETA II reversed ld pinch experiment. V.Antoni, S.Ortolani (Centro di Studio sui Gas Ionati, CNR, Padova, Italy).
*Plasma Phys. (GB*vol.25, no.7, p.799-818 (July 1983).
Magnetic field fluations have been studied in the ETA-BETA II experiment as a functi of density, time and radius. The spectral analysis of the measured fluctuons has shown that the higher frequency portion of the spectrum (>50 Iz) is more sensitive to the density variation, whereas the lower frequencyortion (~10 kHz) shows a radial profile which, especially at later times ring the discharge, resembles the characteristic shape of MHD resistiveodes. Radial correlation lengths of several centimeters are found. In gene the amplitude of the fluctuations increases at lower densities and is larger vard the end of the discharge and in the outer plasma region. These trends ay be correlated with the typical variation of the streaming parameter Hever, the lower frequency fluctuations, in particular, can be interpreted MHD instabilities which can produce large distortion of the magnetic suces leading to island formation and overlapping resulting in stochastic aviour of the magnetic field lines in a relevant radial extent (≈1 cm) ohe outer plasma regions. 52.60 RELATIVISTIC PLASMA

101469 Pair equilibrium in a relativistic plasma with magnetic fields. M.Kusunose (Dept. of Astron., Univ. of Tokyo, Tokyo, Japan), F.Takahara.
Prog. Theor. Phys. (Japan), vol.69, no.5, p.1443-56 (May 1983).
The authors investigate the influence of magnetic fields on the electron-positron pair equilibrium in an optically thin relativistic plasma. They assume that the plasma is uniform and static with a proton density N and a size R and that magnetic fields are randomly oriented. They found that qualitative features are similar to those of a plasma without magnetic fields; there exist two branches of solution for the pair density, and there exist the maximum value attainable of the electron temperature $T_*\equiv kT_e/m_eC^2$ for a given $\tau_N\equiv\sigma_T NR$, where σ_T is the Thomson cross section, and the maximum τ_N allowable for a given T_*. With magnetic fields synchrotron-Compton process produces so many hard photons that pair creation rate of photon processes should increase. As a result the maximum values of T_* and τ_N decreases and the equilibrium pair density decreases (increases) for the higher (lower) branch solution. It is found that these effects are significant, even if the magnetic energy density is below the equipartition value by several orders of magnitude. (15 refs.)

52.65 PLASMA SIMULATION

101470 Direct implicit large time-step particle simulation of plasmas. A.B.Langdon, B.I.Cohen, A.Friedman (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA).
J. Comput. Phys. (USA), vol.51, no.1, p.107-38 (July 1983).
A recently developed implicit method for solving the set of coupled particle and field equations arising in particle-in-cell plasma simulation is described in detail. This implicit integration scheme is motivated by the desire to study efficiently low-frequency, long-wavelength plasma phenomena using a large time step. In particular, this method allows the use of a time step which is larger than the electron plasma period, when electron plasma oscillations are not of interest, and provides selective damping of the distorted remnant of the electron plasma oscillation. The implicit scheme presented here uses particle data directly without introducing fluid moment equations as an intermediary between the field and particle equations. In an electrostatic model, the essence of this scheme is a linearization of the charge density at the advanced time about an explicit approximate density and the computation of the incremental correction to the charge density that is linear in the advanced field. The authors are led to an elliptic field equation whose coefficients depend directly on particle data accumulated on the spatial grid in the form of an effective linear susceptibility. Prediction and iterative refinement of the solution of the implicit equations, and spatial difference representations of the equations are given. Residual restrictions on time step are described. It is demonstrated that convergence is superior when spatial differencing and filtering are done in a consistent manner. (30 refs.)

101471 Computer simulations of the toroidal cusp eriment. S.T.Ratliff, J.M.Dawson (Dept. of Phys., Univ. of California Los Angeles, CA, USA), J.N.Leboeuf, M.Rhodes, N.C.Luhmann,Jr..
Nucl. Fusion (Austria), vol.23, no.8, p.987-1004 (Aug. 19 .
Computer simulations have been performed for the toroi cusp experiment (TCX), a plasma device built and operated at the Unive ty of California, Los Angeles. TCX is a toroidal MacKenzie machine with n external magnetic field provided by 48 magnetic cusps arranged in polo rings. A transformer generates a toroidal electric field which causes a cur t to flow in the plasma. Experimentally, the following parameters are obse d in hydrogen: $n_e = 2 \times 10^{13}$ cm^{-3}, $T_e = 10$-20 eV, $T_i = 40$-110 eV. The to dal current is carried mostly by the ions. A computer model of TCX has en developed, using a two-and-one-half-dimensional electromagnetic particle de. Basically, the simulation results (the electrons are restrained by the agnetic cusp fields, the ions are free to move, there is ion heating, and a atively large fraction of the current is ion current) agree with those of the eriment and are explained by simple physical theoretical arguments. Thes provide the scalings observed in the simulation model. (39 refs.)

52.70 PLASMA DIAGNOSTIC TECHNIQUES A D INSTRUMENTATION

101472 The influence of the fluctuation amplitude on the probe cha teristic. S.Klagge (Dept. of Phys./Electronics, Ernst-Moritz-Arndt U Greifswald, Greifswald, Germany), M.Maass.
Beitr. Plasma Phys. (Germany), vol.23, no.4, p.355-68 (1983).
The time-averaged probe current is calculated by using a sampling metho for sinusoidal and sawtooth-like oscillations of the space potential. The effec of oscillations on the measured plasma parameters obtained with the aid o the single probe method, double probe method and the method of the second derivative of the probe characteristic is discussed, with the electron saturation current being taken into account. In the ion current the values r_p/λ_D, λ/r_p and M_i characterizing the working regime are varied. The calculated results are checked by corresponding measurements in a beam generated plasma. (22 refs.)

101473 Determination of the quadrupole moment of the electron distribution function in a plasma. S.A.Kazantsev (Inst. of Phys., A.A. Zhdanov Leningrad State Univ., Leningrad, USSR).
JETP Lett. (USA), vol.37, no.3, p.158-60 (5 Feb. 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.3, p.131-3 (5 Feb. 1983).
The first physical evidence of a quadrupole moment of the electron distribution function in a plasma has been detected: the total angular momenta of the ensemble of excited particles become aligned and give rise to a partial linear polarisation of the spontaneous emission. (5 refs.)

101474 Spectroscopy and diagnostics of highly ionized plasma. K.Mori (Inst. of Phys. & Chem. Res., Wako, Japan), T.Kato.
Oyo Buturi (Japan), vol.52, no.3, p.192-211 (March 1983). In Japanese.
Summarizes recent topics in the spectrometry of highly ionized plasma, in reference to impurity measurements in nuclear fusion reactions, 2s-2p level transition in the $2s^k2p^l$ electron configuration spectrum has been well investigated and has become a powerful tool in examination of plasma. It is often used to measure Doppler temperature, impurity density and electron density of a Tokamak plasma. On the other hand, the attention to phenomena relating to two-electron capture has been given in laser plasma and Tokamak plasma studies. Satellite rays concentrated to a narrow wavelength range appear together with two-electron recombination, and thus are useful for examining the state of plasma. (83 refs.) *K.B.*

101475 Measurement of electron concentration of a weakly ionized glow discharge plasma in nitrogen at intermediate pressures. Yu.B.Golubovskii, V.M.Telezhko.
Opt. & Spectrosc. (USA), vol.54, no.1, p.33-7 (Jan. 1983). Translation of: *Opt. & Spektrosk. (USSR)*, vol.54, no.1, p.60-7 (Jan. 1983).
Holographic-interference methods are developed for measuring the temperature field and absolute value of the gas temperature by the method of counting interference fringes traversing the interference field after switching on the discharge. A comparison is made with measurements of the rotational temperature of the $C^3\pi_u$ state of nitrogen. The authors show that information can be obtained concerning the electron component of the plasma. A comparison with experimental results is made on the basis of analyzing the ionization balance. Concrete measurements and calculations are made for a nitrogen discharge at pressures of 20-200 Torr and currents of 25-100 mA. (14 refs.)

101476 Use of Laue-geometry X-ray diffraction in the spectroscopy of laser plasmas. A.Hauer (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA).
Opt. Lett. (USA), vol.8, no.8, p.434-6 (Aug. 1983).
Laue X-ray crystal diffraction geometry offers a number of advantages for the spectroscopic diagnosis of laser plasmas. Applications of this diffraction configuration, such as absorption spectroscopy, time-resolved spectroscopy, and X-ray polarization measurements, are described. (7 refs.)

101477 Heterodyne detection of lower hybrid waves in a plasma by microwave scattering. Y.Uesugi, T.Itoh, S.Takamura, T.Okuda (Dept. of Electrical Engng., Nagoya Univ., Nagoya, Japan).
Plasma Phys. (GB), vol.25, no.8, p.875-82 (Aug. 1983).
Lower hybrid waves externally excited by a meander-line slow-wave antenna were observed by scattering of 70 GHz microwaves. The spatial distribution and wavenumber spectrum of lower hybrid waves travelling in a linear plasma were obtained. The up-shifted and down-shifted scattering signals from the incident microwave were separately observed by a phase locked heterodyne receiver. These observations make clear not only the magnitude but also the direction of the wavenumber vector. These are consistent with the auxiliary wave measurements using an electrostatic probe. (10 refs.)

101478 Plasma measurements from neutral-beam attenuation. J.H.Foote, A.W.Molvik, W.C.Turner (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA).
Rev. Sci. Instrum. (USA), vol.54, no.8, p.928-34 (Aug. 1983).
Extensive and informative plasma measurements have been made with the intense and energetic neutral-particle beams that are used for fueling and heating magnetically confined, controlled-fusion experimental plasmas. This diagnostic technique does not perturb the plasma because only the unused transmitted fraction of a neutral beam is detected. Orthogonal arrays of highly collimated detectors of the simple secondary-electron-emission type are used in magnetic-mirror experiments to measure neutral-beam attenuation (directly related to the plasma line density) along chords through the plasma volume at different radial and axial positions. Data from these arrays yield radial and axial plasma-density profiles, ion angular distributions at the plasma midplane, estimates of the neutral-beam input power to the plasma, and information on macroscopic plasma motion. Representative results obtained by applying this useful diagnostic technique to the recently completed tandem-mirror experiment TMX are included here. This diagnostic method can also be advantageously applied to other controlled-fusion experiments that use neutral-beam injection. (25 refs.)

101479 Electron temperature measurements using a 12-channel array probe. N.Wild, R.L.Stenzel, W.Gekelman (Dept. of Phys., Univ. of California, Los Angeles, CA, USA).
Rev. Sci. Instrum. (USA), vol.54, no.8, p.935-9 (Aug. 1983).
The electron temperature in a pulsed high-β ($\beta \equiv 2\mu nkT/B^2 \approx 1$) plasma is studied as a function of time using a miniature array of 12 planar Langmuir probes. Instead of sweeping the bias voltage on the collectors, each is set at a different voltage corresponding to points along the characteristic *I-V* curve. A fast-analog multiplexer, together with a computerized data-acquisition system, allows determination of T_e to within a few percent accuracy, with a time resolution of 1 μs. The probe is used to study temperature fluctuations and heat transport in a plasma current sheet. (8 refs.)

101480 Effect of resonant absorption of laser-induced plasma on temporal resolved spectrum and temporal integrated spectrum. Yu Wenyan, Tan Weihan, Ding Liming, Zhou Fuzheng, Zhang Weiqing, Huang Guanlong, Deng Ximing (Shanghai Inst. of Optics & Fine Mech., Acad. Sinica, Shanghai, China).
Sci. Sin. (China), vol.26, no.6, p.666-72 (June 1983).
Plane aluminium targets are irradiated with Nd: glass laser light of 3-6J, 100 ps pulses with a power density of 10^{15} W/cm^2. The authors have measured the resonant absorption curve by means of a box calorimeter, by changing the laser polarization and the light incident angles with respect to the surface. The temporal resolved spectrum and the temporal integrated spectrum of the second harmonics are measured by the temporal resolved spectrometer. The electron temperature is measured from the X-ray spectral lines. The experimental results show that the resonant absorption increases with the incident angles, while the spectral broadening of the second harmonics produced by the *P*-polarization component gets narrower in comparison with that of the *S*-polarization component. 101481 The fo ation of double-valued sheaths in thermionic converters. L.Lundgren (Res. b. of Electronics, Chalmers Univ. of Technol., Gothenberg, Sweden).
J. Appl. Phys. (USA vol.54, no.8, p.4354-8 (Aug. 1983).
A theory for the sh h in an ignited thermionic converter is presented. The theory includes the fect of the velocity spread of the particles but the charge-particle collisi are neglected. Conditions for the appearance of a virtual emitter are giv The theory is compared with a beam approximation theory and a hydrody mic theory. All three theories give almost the same condition for the appe nce of a virtual emitter in an ignited thermionic converter. (9 refs.)

101482 Unlimited e tron acceleration in laser-driven plasma waves. T.Katsouleas, J.M.Daws (Univ. of California, Los Angeles, CA, USA).
Phys. Rev. Lett. (USA), v 51, no.5, p.392-5 (1 Aug. 1983).
It is shown that the lim tion to the energy gain of $2(\omega/\omega_p)^2mc^2$ of an electron in the laser-plas beat-wave. This accelerates particles parallel to the phase fronts of the acc rating wave which keeps them in phase with it. Arbitrarily large energy is t oretically possible. (9 refs.)

101483 Unsteady phen ena in high-interaction MHD generators. M.Ishikawa (Inst. of Atomic ergy, Kyoto Univ., Kyoto, Japan).
Tech. Rep. Inst. At. Energy oto Univ. (Japan), no.192, p.1-15 (Dec. 1982).
Details of a code which trea unsteady phenomena in MHD generators are described. Governing equation consist of unsteady, one-dimensional Navier Stokes equations, the Maxwe equations, and the generalized Ohm's Law. The usual infinite segmentatio assumption is adopted in the electrical calculations. An artificial viscosity added to maintain the numerical stability. The 1969 MacCormack proced is used to solve the equations. A short

fault of the external load of a subsonic Faraday type MHD generator induces a large pressure overshoot, which propagates upstream to an entrance. An open fault produces a large velocity overshoot and a pressure undershoot. In contrast with the short fault case, the backward wave (*u-a* wave) becomes very weak. The behaviour of a subsonic diagonal type MHD generator is complicated, showing a slow response against the short fault. No backward wave is calculated in the case of supersonic generators. 52.80 ELECTRIC DISCHARGES

(see also 51.50 Electrical phenomena in gases)

101484 Studies of exploding wire. K.Isuzugawa, T.Fujimura (Dept. of Electrical Engng., Osaka Univ., Osaka, Japan).
Bull. Univ. Osaka Prefect. Ser. A (Japan), vol.31, no.2, p.111-16 (1982).
The simulation of the exploding process of copper wire through an impulse current is tried in this paper. The equations of the equivalent circuit for the wire explosion which contains the wire resistance expressed as a function of temperature, are solved numerically, so that the discharging current i and the voltage drop v_r across the wire are obtained. These are compared with the oscillograms observed experimentally, the results of which show the success in the simulation for the duration in which the value of the wire temperature rises from room temperature to the boiling point at atmospheric pressure (2583°C). However, for the temperature region above the boiling point more studies are required. (3 refs.)

101485 Temperature measurement of copper wire in process of the electrical explosion. K.Isuzugawa, T.Fujimura (Dept. of Electrical Engng., Osaka Univ., Osaka, Japan).
Bull. Univ. Osaka Prefect. Ser. A (Japan), vol.31, no.2, p.117-23 (1982).
Deals with radiometric temperature measurements of a copper wire heated be passing of an impulse current. The radiant fluxes from the wire 800 nm, the band width: 10 nm, are detected by a photomultiplier tube, whose outputs are observed with a cathode ray oscillator scope. Copper wire's temperature is calculated from the observed values of the intensities of radiations using Planck's equation, but the effects of temperature on the spectral emissivity are disregarded. The results agree with the values estimated in terms of energies supplied to the wire. (3 refs.)

101486 On the anomaly of the electrical field strength in the magnetized positive column of glow discharges at small currents. H.Deutsch, S.Klagge (Sektion Phys./Elektronik, Ernst-Moritz-Arndt-Univ. Greifswald, Greifswald, Germany).
Beitr. Plasma Phys. (Germany), vol.23, no.4, p.341-54 (1983).
The axial electrical field strength in the positive column of glow discharges at small currents in noble gases passes through a maximum with the increase of an axially directed magnetic field. This maximum is explained of the contrary processes of extension of the radial profiles of the electron energy and the concentration of the metastable atoms on the one hand and the decrease of the ambipolar diffusion losses on the other hand. Using the results of measurements of metastable atom concentrations, the electrical field strength is calculated as a function of magnetical induction with the aid of a set of balance equations. The radial and axial distribution of the electrons is checked by probe measurements. The methods for measuring the concentration of the excited atoms and the electrons are described. (27 refs.)

101487 DC breakdown of ultra-high vacuum gaps. V.A.Nevrovsky, V.I.Rakhovsky, V.G.Zhurbenko (Res. Centre for Surface & Vacuum Investigation, Moscow, USSR).
Beitr. Plasma Phys. (Germany), vol.23, no.4, p.433-58 (1983).
A review of mechanisms of the initiation of vacuum breakdown is presented and role of anode surface contaminations in enhancement of prebreakdown currents and initiation of breakdown is emphasized. The experimental investigation of vacuum breakdown and prebreakdown phenomena is described. The desorption of anode contaminations under electron bombardment to be an essential factor of stimulation of electrical breakdowns. Possible influence of desorbed gases on prebreakdown state of electrodes is analysed. (68 refs.)

101488 Flashover voltage of spacer insulators in a vacuum at 290-6K. J.Wankowicz (Inst. of Fundamental Electrotech. & Electrotechnol., Tech Univ. of Wroclaw, Wroclaw, Poland).
Cryogenics (GB), vol.23, no.9, p.482-6 (Sept. 1983).
The dependence of insulator surface strength on temperature in the range of 290-6K in a vacuum is presented. The insulator surface strength was found to increase in the range of liquid nitrogen and liquid helium temperatures compared with the flashover voltage measurements at ambient temperatures. Complex distributions of flashover voltage were obtained and were plotted on Weibull probability paper. The effect seems to be the result of the increase in insulator temperature near the triple junction. A suitable model of the correlation between the insulator flashover voltage and its temperature was proposed. (14 refs.)

101489 Formation of current of positive leader in air. E.M.Bazelyan.
Power Eng. (J. Acad. Sci. USSR) (USA), vol.20, no.3, p.80-7 (1982). Translation of: *Izv. Akad. Nauk SSSR Energ. & Transp.*, vol.20, no.3, p.82-9 (1982).
Measurements have been made of the charge carried to the cathode by the heads of individual streamers together with their rate of generation in the development of a positive leader in an air gap with nonuniform electric-field distribution. An experimental estimate has been made of the per-unit-length conduction of streamer channels; it has been established that it is of little significance in the formation of the discharge current. Validation has been provided for the hypothesis that the leader current is organized owing to the effect of transportation at electronic speeds of the positive charge at streamer heads. A computational model of the current is proposed; quantitative estimates have been made that are in satisfactory agreement with the experimental data. (9 refs.)

101490 Effect of matrix on the magnetic enhancement of spectral lines in the DC arc. M.A.Eid, A.A.Fakhry, K.M.Elbehery, M.S.Hashem (Dept. of Phys., Nat. Res. Centre, Cairo, Egypt).
Indian J. Pure & Appl. Phys., vol.21, no.5, p.293-7 (May 1983).
Five matrices of different ionization potentials, containing traces of different elements were prepared. The optimal arcing conditions were determined. Application of the magnetic field revealed a relation between the ionization potential of the matrix and the magnetic enhancement factor of spectral lines. Matrices of high ionization potentials caused remarkable magnetic enhancement of the spectral lines, while those having low ionization potentials showed decrease in the intensity of spectral lines on application of the magnetic field to the arc. Moreover, it was found that the changes in the temperature and the electron pressure of the arc plasma, induced by the application of the magnetic field, may be one of the reasons for the magnetic enhancement of spectral lines. (9 refs.)

101491 Time-dependent behavior of high-pressure mercury discharges. H.P.Stormberg, R.Schafer (Philips GmbH Forschungslab. Aachen, Aachen, Germany).
J. Appl. Phys. (USA), vol.54, no.8, p.4338-47 (Aug. 1983).
A numerical model has been developed for studying the time-dependent behavior of cylindrical high-pressure mercury discharges. The model makes it possible to calculate time-dependent plasma parameters such as temperature profiles, arc conductance, etc., for arbitrary supply voltage waveforms and frequencies. The model is based on an expansion of the heat flux potential into a series of Bessel functions of zero order. An analytical approximation for the local net emission has to be provided for the model. It has been evaluated as a function of lamp diameter, mercury pressure, axis temperature, and temperature profile by calculating the radiation transport in the mercury lines. The calculated wall temperature and luminous flux as well as the calculated time-dependent lamp voltage, current, and arc temperature profiles are compared with corresponding measurements. (28 refs.)

101492 Two-temperature modeling of the free-burning, high-intensity arc. K.C.Hsu, E.Pfender (Dept. of Mech. Engng., Univ. of Minnesota, Minneapolis, MN, USA).
J. Appl. Phys. (USA), vol.54, no.8, p.4359-66 (Aug. 1983).
In this paper a two-temperature model ($T_e > T_h$) is applied to a free-burning, high-intensity, atmospheric pressure argon arc. With appropriate boundary conditions and nonequilibrium thermodynamic and transport properties, solutions of the conservation equations are obtained for the entire arc, except for the electrode sheath regions. Significant temperature discrepancies between electrons and heavy particles are found in the arc fringes. The elevated electron temperatures in the arc fringes lead to a rearrangement of the current density distribution which, in turn, has some effect on the temperature as well as on the velocity field in the arc core. Comparisons of the results of this study with spectrometric temperature measurements show better agreement than with results based on a one-temperature model. (14 refs.)

101493 Dynamics of long-lived states of strontium atoms and ions in a pulsed discharge in a mixture with helium. E.K.Karabut, V.F.Kravchenko, V.S.Mikhalevskii.
J. Appl. Spectrosc. (USA), vol.37, no.4, p.1123-7 (Oct. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.4, p.564-9 (Oct. 1982).
It is necessary in connection with the investigation of mechanisms for the excitation of the levels of atoms and ions in the plasma of a pulsed discharge and the determination of the optimal conditions for the creation of a population inversion to have as complete a conception as possible about the formation and deactivation processes of long-lived states. The paper is devoted to an investigation of a pulsed discharge plasma in a mixture of strontium vapors with helium. This metal is a typical representative of the group of alkali earth elements whose vapors serve in a mixture with buffer gases as active media both of recombination lasers and of lasers based on self-limiting transition. By virtue of the fact that the structure of the atoms of these elements is identical, data on the processes which occur in an Sr-He plasma can be generalized to the plasma of these elements as a whole. The validity of such a generalization is also confirmed by a comparison of the results of a series of experiments which the authors have performed with Ca and Ba with a pulsed discharge in a mixture of the vapors of these metals with helium. (9 refs.)

101494 Effect of mobilities and electric field on the stability of magnetized positive column.
Plasma Phys. (GB), vol.25, no.8, p.937-42 (Aug. 1983).
The effect of the ratio of the mobilities of electrons and ions and non-dimensional electric field, on the stability of magnetized positive column for all unstable modes is studied in a self-consistent formulation for the perturbations of plasma density and electric potential. The minimum non-dimensional electric field at which magnetized positive column becomes unstable for different ratios of the mobilities of electrons and ions is also investigated. The analysis covers a wider range of modes than done previously. (3 refs.)

101495 Model of optogalvanic effects in the neon positive column. D.K.Doughty, J.E.Lawler (Dept. of Phys., Univ. of Wisconsin, Madison, WI, USA).
Phys. Rev. A (USA), vol.28, no.2, p.773-80 (Aug. 1983).
An experimental and theoretical investigation of the 594.5-nm, optogalvanic effect in the Ne positive column is described. The effect is a decrease in discharge conductance due to laser-induced depletion of metastable atoms. Absolute measurements of the effect per unit of absorbed laser power are reported for a wide range of discharge conditions. Positive-column discharges with radius-pressure products of 0.1-1.0 cm Torr and with sustaining direct currents of 1-16 mA are studied. The effect is modeled in this regime by applying perturbation theory to key rate equations that describe the discharge. The model predictions are in agreement with the experimental measurements. Absolute densities of atoms excited to the $2p^5 3s$ levels are also reported. The regime studied covers the transition from a discharge sustained primarily by single-step electron-impact ionization to a discharge sustained primarily by two-step ionization via the $2p^5 3s$ metastable levels. The global power balance of the discharge is domsinated by wall losses of atom excited to the $2p^5 3s$ levels at all pressures and currents studied. (29 refs.)

101496 Electric arc and its applications. C.Gary.
Rev. Gen. Electr. (France), no.4, p.264-5 (April 1983). In French.
The author indicates the various possible electric arc applications as well as the processes in which it occurs. The author emphasizes the work being done at the universities, whose approach is that of a fundamental viewpoint study permitting a hard and fast description of the arc and increasing our knowledge about this phenomenon. (no refs.)

101497 Studies into the mercury-argon discharge at an elevated supply frequency. Yu.F.Kalyazin, V.M.Milenin, N.A.Tomofeev.
Svetotekhnika (USSR), no.6, p.10-11 (1983). In Russian.
Theoretical and experimental studies of gas discharge plasma (AC, at a higher-than-normal frequency) in a mercury vapour-argon mixture have been carried out. The solution of the balance equations for a positive discharge column permitted the calculation of variations in the instantaneous electrokinetic plasma characteristics (concentration and mean electron energy, strength of the longitude electric field and their time-averaged values) in respect with the current oscillation period. The calculation results are in good agreement with the theory. (2 refs.)

101498 A mechanism of anode initiation of vacuum breakdown. A.S.Dmitriev, O.A.Sinkevich (Energy Inst., Moscow, USSR).
Sov. Phys.-Dokl. (USA), vol.27, no.11, p.961-3 (Nov. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.1-3, p.363-6 (Nov. 1982).
The anode mechanism may be due to fast processes that take place in a time shorter than the delay time of the breakdown. One of these processes may be the destruction of local areas of the anode by thermoelastic stresses and by subsequent breakdown which is aided by fragments of the anode material. The authors examine the simplest quantitative theory of this process. The kind of anode-initiated breakdown that they are considering is not an alternative to the thermal-instability mechanism and can act in the initial stages of the latter. Moreover, the investigation of the thermoelastic mechanism of anode destruction is linked to a number of experimental facts that are difficult to explain without invoking this mechanism. Thus, many experiments indicate that there is transport of anode material during the prebreakdown stage. (14 refs.)

101499 Laser spark with a continuous channel in air. F.V.Bunkin, V.V.Korobkin, Yu.A.Kurinyi, L.Ya.Polonskii, L.N.Pyatnitskii (Inst. of High Temperatures, Acad. of Sci., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.2, p.254-5 (Feb. 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.2, p.443-4 (Feb. 1983).
Radiation from a neodymium gas laser (with an output power ~1 GW) was focused by an axicon to produce a laser spark with a continuous channel in the atmosphere. The length of the channel reached 11 cm. (6 refs.)

101500 Neutral particle temperature field in cylindrical glow discharge with axial gas flow. R.F.Yunyusov, R.B.Mukhametzyanov.
Sov. Aeronaut. (USA), vol.25, no.2, p.43-8 (1982). Translation of: *Izv. VUZ Aviats. Tekh. (USSR)*, vol.25, no.2, p.40-4 (1982).
The authors solve the energy equation describing the neutral particle temperature field in a glow discharge with axial gas flow and obtain formulas which make it possible to calculate the gas temperature and Nu number as a function of the power deposited in the discharge, gas velocity, wall temperature, channel geometry, initial temperature profile and the gas properties. (7 refs.)

101501 On the metallic phase arc at the break of W-contacts. K.Sawa, K.Noda, T.Murakoshi, K.Miyachi (Faculty of Sci. & Technol., Keio Univ., Yokohama, Japan).
Trans. Inst. Electron. & Commun. Eng. Jpn. Part C (Japan), vol.J66C, no.5, p.361-8 (May 1983). In Japanese.
It is found that a metallic phase arc is definitely distinguished by measurement of a spectral-line intensity from metal vapor. By this method, the metallic phase arc is investigated in an inductive circuit and the following are made clear. (1) The relation between metallic phase duration and its termination current is independent of inductance values, and the spectral-line intensity at the metallic phase termination is also a sole function of the metallic phase duration. (2) When peak values of the spectral-line intensity just after the break are the same, even if the circuit currents and inductance values are different, the metallic phase durations become equal. 101502 A possible algorithm for the entropy method of constructing the electron density in a crystal. E.A.Soldatov, E.A.Kuz'min, V.V.Ilyukhin, N.V.Belov (Physicotech. Res. Inst., N.I. Lobachevski State Univ., Gorki, USSR).
Sov. Phys.-Dokl. (USA), vol.27, no.11, p.904-5 (Nov. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.1-3, p.388-90 (Nov. 1982).
The authors have previously proposed a new method of constructing the electron density distribution in a crystal on the basis of the Fourier coefficients of this distribution (the structure amplitudes). The method is based on the fact that the electron density at a given point in the crystal is proportional to the probability density for finding an electron at this point. They apply Jaynes' principle for determining the probability-density distribution and thereby the electron-density distribution. (2 refs.)

101503 On the possibility of determining the phases of structure amplitudes by an algebraic method. E.A.Soldadtov, E.A.Kuz'min, V.V.Ilyukhin, N.V.Belov (Physicotech. Res. Inst., N.I. Lobachevski State Univ., Gorki, USSR).
Sov. Phys.-Dokl. (USA), vol.27, no.11, p.908 (Nov. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.1-3, p.644-5 (Nov. 1982).
The authors discuss an algebraic method for determining the phases of structural amplitudes and the basis of the existence of a linear relation between individual (normalised) structure amplitudes (squares of their absolute values). Comparing this method with the known statistical methods of determining phases and the tangent formula, they point out that this approach does not involve any probabilities, and this means that the correctness of the phase determination will not be affected (or at least to a much lesser extent and in a different manner) by the pseudosymmetry that reduces to dividing the structure into a substructure and a superstructure. (5 refs.)

101504 Huang diffuse scattering from interstitials in a general orthorhombic and tetragonal lattice. R.Khanna (Materials Sci. Lab., Reactor Res. Centre, Kalpakkam, India).
Pramana (India), vol.20, no.4, p.267-77 (April 1983).
Using the continuum theory of linear elasticity, Huang diffuse scattering (HDS) has been calculated from self-interstitials in a general orthorhombic and tetragonal lattice. Various defect configurations are represented according to the point group symmetry of the defect site. The contribution to HDS from all possible equivalent orientations (assumed to be equally populated) of the defect configuration is averaged. The limitations of HDS in discriminating between defect configurations having the same long-range symmetry are discussed, considering some special cases. (11 refs.)

101505 Diffuse X-ray scattering near Bragg peaks from point defects in a general lattice. R.Khanna (Materials Sci. Lab., Reactor Res. Centre, Kalpakkam, India).
Pramana (India), vol.20, no.4, p.279-86 (April 1983).
Using the continuum thoery of linear elasticity, diffuse X-ray scattering has been calculated in the immediate neighbourhood of Bragg peaks from point defects in a lattice containing more than one atom in the unit cell. General expressions are obtained for the Debye-Waller factor, Huang diffuse scattering and the asymmetric scattering due to the defect. For lattices with one atom per unit cell, these expressions reduce to the well-known formulae of diffuse scattering. (9 refs.)

101506 About a feature of X-ray diffraction in imperfect crystals. P.H.Bezirganyan, V.G.Aslanyan (Dept. of Solid State Phys., Erevan State Univ., Grevan, USSR).
Phys. Status Solidi a (Germany), vol.78, no.1, p.157-61 (16 July 1983).
The influence of the surface and of the bulk defects upon the intensity of X-ray scattering is considered. It is shown that in particular cases the deformation of the crystal leads to a more efficient increase of diffracted waves than the attenuation of the waves propagating at an angle different from the strict Bragg angle. (6 refs.)

101507 A generalized probabilistic approach to special Fourier syntheses (β-synthesis). V.I.Bondar', V.G.Rau, V.V.Ilyukhin, N.V.Belov (P.I. Lebedev-Polyanskii State Pedagogical Inst., Vladimir, USSR).
Sov. Phys.-Dokl. (USA), vol.27, no.11, p.903-4 (Nov. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.1-3, p.386-8 (Nov. 1982).
A probabilistic approach to the Patterson function was proposed and developed by Ilyukhin (1972) and has been used to appraise the discrimination of key peaks on the diagram of the vector system. The authors consider the technique of a generalized probabilistic treatment, capable not only of giving rough probabilistic characteristics of individual peaks (and even fragments) but also of solving the problem of choosing the method of interpreting a structure from experimental data and determining the possibilities of one or another Patterson or special, modified Fourier synthesis. 101508 Diffraction contrast from partial dislocations in the two-beam dynamical theory. A.M.Arustamyan (Erevan State Univ., Erevan, USSR), F.N.Chukhovskii.
Phys. Status Solidi a (Germany), vol.78, no.1, p.K35-8 (16 July 1983).
The theory of electron diffraction contrast on the base of the S-matrix theory is extended to the case of the partial dislocation strain field. By definition a

partial dislocation has a stacking fault on one side of it and since the Burgers vector b_P is not a lattice vector, the product $\vec{g}b_P$ is not an integer. For example, in the FCC system $n=\vec{g}b_P$ takes values of 0, ±1/3, ±2/3, ±1, ±4/3, etc. It may be noted for an integer quantity n, that the defect will give an image similar to that produced by a perfect dislocation and the stacking fault on one side of it will be invisible. (7 refs.)

61.20 CLASSICAL, SEMICLASSICAL, AND QUANTUM THEORIES OF LIQUID STRUCTURE

(for kinetic and transport theory, see 51.10; for electronic states, see 71.; for liquid helium, see 67.)

101510 **Parametrization of the radial distribution function and thermodynamic properties of the restricted primitive model of electrolyte solutions.** J.Sys, S.Labik, A.Malijevsky (Dept. of Phys. Chem., Inst. of Chem. Technol., Praha, Czechoslovakia).
Czech. J. Phys. Sect. B (Czechoslovakia), vol.B33, no.7, p.763-71 (1983).
Monte Carlo simulations for the restricted primitive model of 1-1 aqueous electrolyte solutions were performed on a minicomputer. The calculations covered the concentration range from 0.1 to 3 mol./dm^3 and the ionic diameter varied from 2.0×10^{-10} to 4.75×10^{-10} m. On the basis of the Monte Carlo results a new analytical radial distribution function and excess internal energy parametrization were proposed for the restricted primitive model. (13 refs.)

101511 **Applications of picosecond and sub picosecond spectroscopy.** H.Graener, H.R.Telle, A.Laubereau (Phys. Inst., Univ. Bayreuth, Bayreuth, Germany).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.393-401 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
Vibrational relaxation processes have received increasing interest in recent years. With ultrashort light pulses and novel experimental techniques the authors are in the position to study vibrational dynamics in the electronic ground state of simple liquids on the subpicosecond and picosecond time scale. The vibrational population lifetimes of (v=1) and (v=2) levels and the nonexponential dephasing in the subpicosecond time domain are considered. (13 refs.)

101512 **Dielectric friction and energy dissipation in polar fluids.** E.Nowak (Dept. of Chem., MIT, Cambridge, MA, USA).
J. Chem. Phys. (USA), vol.79, no.2, p.976-81 (15 July 1983).
The author considers a continuum model for dielectric friction on charged particles. Approximate results for friction coefficients can be derived in a convenient way by calculating the total energy dissipation in the system. This work is closely related to a theory of Hubbard and Onsager (1977); the author shows that these authors have neglected a contribution to the energy dissipation, which can be incorporated without major difficulties. In addition, he proposes a new type of electrohydrodynamic boundary condition which is a generalisation of the familiar hydrodynamic one. The general results are exemplified by studying simple models for moving or rotating ions and polar molecules. (15 refs.)

101513 **Corrections to the HNC equation for associating electrolytes.** R.Bacquet, P.J.Rossky (Dept. of Chem., Univ. of Texas, Austin, TX, USA).
J. Chem. Phys. (USA), vol.79, no.3, p.1419-26 (1 Aug. 1983).
The accuracy of the HNC approximation and modifications based on a simple approximation for the sum of bridge graphs has been studied for a charged soft sphere model for dilute aqueous 2-2 electrolytes. The accuracy is judged based on extensive Monte Carlo (MC) simulation for three representative concentrations: 0.005, 0.0625, and 0.2 M. The MC simulations find monotonically increasing like-charge correlation functions in agreement with the modified HNC results but in contrast with the HNC prediction of a local maximum at low concentration. Nevertheless, HNC provides the best overall quantitative match with MC except at very low concentration; at 5 mM the modifications are a significant improvement. For unlike charge correlations, there is good agreement among all methods; at the ionic contact peak, however, HNC underestimates the peak height and the modifications provide improved accuracy. (29 refs.)

101514 **Percolation behaviour of permeable and of adhesive spheres.** Y.C.Chiew, E.D.Glandt (Dept. of Chem. Engng., Univ. of Pennsylvania, Philadelphia, PA, USA).
J. Phys. A (GB), vol.16, no.11, p.2599-608 (1 Aug. 1983).
The pair-connectedness function and the average cluster size are determined for two different three-dimensional fluid systems using the Percus-Yevick (PY) approximation (1980). The permeable-sphere model of Blum and Stell (1980) provides a one-parameter bridge from the ideal gas (perfectly penetrable spheres) to the PY hard-sphere fluid. Two of such particles are considered to be 'bound' when their cores overlap. The percolation transition is located as a function of the interpenetrability of the particles, and is found to correspond to an average coordination number $\bar{z}=4$. Baxter's adhesive-sphere model (1968) is also investigated in the PY approximation and it is found that at the percolation transition the average coordination number is 2. The boundary between percolating and non-percolating homogeneous thermodynamic states is determined. (24 refs.)

101515 **Analytic studies of the hard dumbbell fluid. I. A RISA-like approximation.** G.P.Morriss (Res. School of Chem., Australian Nat. Univ., Canberra, Australia), P.T.Cummings.
Mol. Phys. (GB), vol.49, no.5, p.1103-20 (10 Aug. 1983).
A closed form analytic theory for the structure of the hard dumbbell fluid is introduced and evaluated. It is found to be comparable in accuracy to the reference interaction site approximation (RISA) of Chandler and Andersen (1972). (41 refs.)

101516 **The chemical potential in non-ideal liquid mixtures. Computer simulation and theory.** K.S.Shing (Dept. of Chem. Engng., Univ. of Southern California, Los Angeles, CA, USA), K.E.Gubbins.
Mol. Phys. (GB), vol.49, no.5, p.1121-38 (10 Aug. 1983).
The authors report Monte Carlo calculations for two non-ideal binary mixtures of Lennard-Jones fluids *A* and *B*. In the first the molecules have the same diameter but different well depths, $\epsilon_{AA}=2\epsilon_{BB}$. In the second the well depths are the same but the diameters differ, $(\sigma_{AA}/\sigma_{BB})^3=2.144$. The chemical potentials of both components are obtained over the entire range of compositions, using a modified test particle method called *f-g* sampling. The simulation data are used to test a variety of mixture theories based on both the *n*-fluid idea and on a perturbation expansion about a mixture of hard spheres. Of the *n*-fluid theories the van der Waals 1- and 2-fluid theories are best in general. However, none of the *n*-fluid theories give good results when the molecular size ratio parameter $(\sigma_{AB}/\sigma_{BB})^3$ differs from unity by more than about 30 or 40 per cent. When the molecules are appreciably different in size the Leonard-Henderson-Barker (LHB) and Lee-Levesque (LL) forms of hard sphere perturbation theory are both much better than the *n*-fluid theories, with the LL theory in closest agreement with the simulation results. (24 refs.)

101517 **Critical behaviour of monatomic and symmetric charged liquids in approximate theories of structure.** G.Senatore, M.P.Tosi, N.H.March (Theoretical Chem. Dept., Univ. of Oxford, Oxford, England).
Phys. & Chem. Liq. (GB), vol.13, no.1, p.55-64 (1983).
A **k** space analysis of the hypernetted chain (HNC) theory of a monatomic liquid is presented for *d* dimensions. Assuming the existence of a critical point, the total correlation function is shown to have long-range behaviour proportional to $r^{-2d/3}$ for short-range interactions. The case of a symmetric charged liquid is then considered in HNC theory and in another approximate treatment of higher-order correlation functions. The number-number structure factor as $k\rightarrow0$ can diverge in both approximate theories whereas the charge-charge structure factor exhibits Debye-Huckel behaviour. The critical ratio $(pV/RT)(n_c,T_c)$ is reduced from the superposition approximation value of 1/2 in the monatomic fluid, while in the charged fluid the 'correction' to 1/2 involves both number-number and charge-charge correlation functions. (14 refs.)

101518 **Nonequilibrium molecular dynamics via Gauss's principle of least constraint.** D.J.Evans (Res. School of Chem., Australian Nat. Univ., Canberra, Australia), W.G.Hoover, B.H.Failor, B.Moran, A.J.C.Ladd.
Phys. Rev. A (USA), vol.28, no.2, p.1016-21 (Aug. 1983).
Gauss's principle of least constraint is used to develop nonequilibrium molecular-dynamics algorithms for systems subject to constraints. The treatment not only includes 'nonholonomic' constraints—those involving velocities—but it also provides a basis for simulating nonequilibrium steady states. The authors describe two applications of this new use of Gauss's principle. The first of these examples, the isothermal molecular dynamics of a three-particle chain, can be treated analytically. The second, the steady-state diffusion of a Lennard-Jones liquid, near its triple point, is studied numerically. The measured diffusion coefficient agrees with the independent estimates from equilibrium fluctuation theory and from Hamiltonian external fields. (21 refs.)

101519 **Thermodynamics and structure of simple dense fluids.** S.K.Datta (Dept. of Phys., Jalpaiguri Government Engng. Coll., Jalpaiguri, India).
Pramana (India), vol.20, no.4, p.313-25 (April 1983).
The perturbation theory of Weeks, Chandler and Anderson (1971) (WCA) has been employed to calculate the free energy and compressibility factor of simple dense fluids characterised by a double Yukawa potential. The structure factor has been calculated in the random phase approximation together with the WCA prescription for the division of the pair potential. The calculated values are in excellent agreement with experimental results. (12 refs.)

101520 **Perturbation theory for equilibrium properties of a binary mixture of hard discs.** U.N.Singh (Dept. of Phys., RN Coll., Vaishali, India), S.K.Sinha.
Pramana (India), vol.20, no.4, p.327-37 (April 1983).
The radial distribution function (RDF) and thermodynamic properties of a two-dimensional hard-disc mixture are calculated by using the perturbation theory. Numerical results are given for the RDF, pressure and excess-free energy of the binary mixture of both additive and non-additive hard discs. It is found that the thermodynamic properties of the binary mixture of non-additive hard discs increase with Δ, the non-additive parameter. (22 refs.)

101521 **Kinetic description of Debye effect.** A.L.Virovlyanskii, A.N.Malakhov (Gor'ki State Univ., Gor'ki, USSR).
Radiophys. & Quantum Electron. (USA), vol.25, no.9, p.710-15 (Sept. 1982). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.25, no.9, p.992-7 (Sept. 1982).
Deals with a flowing solution of a strong electrolyte. A self-consistent electric field is introduced for a description of the interaction of ions (just as in the theory of a collisionless plasma). An equation of kinetics is derived for calculating the electric field and the velocity distribution of ions, as well as their distribution in the coordinate space. This equation is used for describing the Debye effect. (9 refs.)

101522 **Stochastic dynamics of polymers.** W.F.van Gunsteren, H.J.C.Berendsen (Lab. of Phys. Chem., Univ. of Groningen, Groningen, Netherlands).
Physics of Superionic Conductors and Electrode Materials. Proceedings of a NATO Advanced Study Institute on the Physics of Superionics Conductors and Electrode Materials, Odense, Denmark, 4-22 Aug. 1980 (New York, USA: Plenum Press 1983), p.241-56
When simulating a molecular system by the method of stochastic dynamics (SD), less interesting degrees of freedom are ignored and their influence on the other degrees of freedom is approximated by a combination of mean force interactions, stochastic forces and frictional forces. When time and space correlations in the latter are neglected, SD reduces to its simplest form, Brownian dynamics (BD). A BD algorithm is derived and applied to liquid n-butane and n-decane, where one molecule is considered explicitly and the surrounding liquid is modelled stochastically. From a comparison of the results to those of molecular dynamics (MD) simulations of these liquids it is

concluded that the BD model yields a good approximation of the dynamics of n-alkanes in the liquid state. (23 refs.)

101523 A molecular dynamics simulation of rotational and vibrational relaxation in liquid HCl. D.Levesque, J.-J.Weis (Lab. de Phys. Theorique et Hautes Energies, Univ. de Paris XI, Orsay, France), D.W.Oxtoby.
J. Chem. Phys. (USA), vol.79, no.2, p.917-25 (15 July 1983).
The authors have carried out a molecular dynamics simulation of liquid HCl near its normal boiling point using the C^* potential of Klein and McDonald (1981). A wide variety of equilibrium and dynamical properties have been studied, ranging from partial structure factors to velocity, angular velocity and torque autocorrelation functions. Dipole moment and polarizability tensor correlation functions have been evaluated and compared with experimental data from dielectric relaxation and Raman line shape studies. Vibrational phase relaxation has been simulated; the authors show that HCl is an intermediate case between the rapid modulation and static broadening limits. The question of correlation between rotational and vibrational relaxation is discussed. (37 refs.)

101524 Comparison of simple potential functions for simulating liquid water. W.L.Jorgensen, J.Chandrasekhar, J.D.Madura (Dept. of Chem., Purdue Univ., West Lafayette, IN, USA), R.W.Impey, M.L.Klein.
J. Chem. Phys. (USA), vol.79, no.2, p.926-35 (15 July 1983).
Classical Monte Carlo simulations have been carried out for liquid water in the NPT ensemble at 25°C and 1 atm using six of the simpler intermolecular potential functions for the water dimer: Bernal-Fowler (BF), SPC, ST2, TIPS2, TIP3P, and TIP4P. Comparisons are made with experimental thermodynamic and structural data including the recent neutron diffraction results of Thiessen and Narten (1982). The computed densities and potential energies are in reasonable accord with experiment except for the original BF model, which yields an 18% overestimate of the density and poor structural results. The TIPS2 and TIP4P potentials yield oxygen-oxygen partial structure functions in good agreement with the neutron diffraction results. The accord with the experimental OH and HH partial structure functions is poorer; however, the computed results for these functions are similar for all the potential functions. Consequently, the discrepancy may be due to the correction terms needed in processing the neutron data or to an effect uniformly neglected in the computations. Comparisons are also made for self-diffusion coefficients obtained from molecular dynamics simulations. Overall, the SPC, ST2, TIPS2, and TIP4P models give reasonable structural and thermodynamic descriptions of liquid water and they should be useful in simulations of aqueous solutions. The simplicity of the SPC, TIPS2, and TIP4P functions is also attractive from a computational standpoint. (25 refs.)

101525 Structure and electronic properties of molten $TlAsSe_2$. T.Satow, K.Hoshino, O.Uemura (Dept. of Chem., Yamagata Univ., Yamagata, Japan).
J. Non-Cryst. Solids (Netherlands), vol.57, no.1, p.91-100 (Aug. 1983).
Radial distribution functions of $TlAsSe_2$ in both the amorphous and the liquid states were determined using X-ray and the neutron diffraction techniques. The electrical conductivity, the thermoelectric power and the magnetic susceptibility for liquid $TlAsSe_2$ were also measured over a wide temperature range from the melting point up to about 900°C. Radial distribution analysis suggested that the spiral chains consisting of As and Se atoms in the crystalline $TlAsSe_2$ are still present in both the amorphous and the liquid states. The electronic properties of the liquid $TlAsSe_2$ above 600°C indicate a strong temperature dependence. These experimental results are discussed by the use of the conventional theories often employed in disordered materials. (17 refs.)

101526 Coordination chemistry and ionic solvation in divalent metal halide aqueous solutions. P.V.Giaquinta, M.P.Tosi, N.H.March (Theoretical Chem. Dept., Univ. of Oxford, Oxford, England).
Phys. & Chem. Liq. (GB), vol.13, no.1, p.1-24 (1983).
A useful local picture of structure in divalent metal halide aqueous solutions is obtained from arguments drawn from coordination chemistry. The coordination chemistry of metal ions is examined and the crystal structures of hydrated salts discussed. Finally, the local coordination of metal ions in water is investigated. (36 refs.)

101527 Conformational transition in syndiotactic PMMA. VI. Mono- and dichlorobenzene. I.Katime, P.Gutierrez Cabanas, J.R.Ochoa, M.Garay, C.Ramiro Vera (Dept. de Quimica Fisica, Univ. del Pais Vasco, Bilbao, Spain).
Polymer (GB), vol.24, no.8, p.1015-17 (Aug. 1983).
The authors have studied the thermal behaviour of syndiotactic PMMA in several solvents by viscometry. A conformational change has been found in the temperature range 293-308K. (27 refs.)

101528 Molecular dynamics studies of molten NaI. III. Longitudinal and transverse currents. M.Dixon (Theoretical Phys. Div., AERE, Harwell, England).
Philos. Mag. B (GB), vol.48, no.1, p.13-29 (July 1983).
For pt.II see ibid., vol.47, p.531 (1981). Molecular dynamics simulations of molten NaI have been performed using rigid-ion and polarizable-ion models. The trajectories of the ions have been analysed to give the mass, charge and number currents. The frequency spectra of the current autocorrelation functions have been determined. The inelastic neutron scattering spectrum is reported. (13 refs.)

101529 Interaction between components of polymer blends by scattering. G.Hadziioannou (IBM Res. Labs., San Jose, CA, USA), J.Gilmer, R.S.Stein.
Polym. Bull. (Germany), vol.9, no.12, p.563-9 (May 1983).
The Flory interaction coefficient χ_{AB} of binary polymer blends of high concentration may be determined from the study of light, X-ray, or neutron scattering at $q=0$. Neutron scattering measurements are particularly effective for these measurements since scattering intensity may be enhanced through deuteration of one component. (26 refs.)

101530 Dimensions of poly(styrene) in the vicinity of the theta point. D.Nerger (Inst. fur Makromolekulare Chem. Univ. Freiburg, Freiburg, Germany), M.Eisele, K.Kajiwara.
Polym. Bull. (Germany), vol.10, no.3-4, p.182-6 (July 1983).
The decrease of the mean-square radius of gyration of a high molecular weight polystyrene dissolved in cyclohexane with decrease of temperatures to far below θ was observed by conventional light scattering techniques. The experiments were performed in the region of the coil-globule transition of the polymeric chain. The transition was reversible upon repeated heating and cooling of the sample. Aggregation occured at temperatures below the sharp decrease of the polymer dimensions. (11 refs.)

101531 Solution properties of poly(N-butyl methacrylamide). K.Ulbrich, L.Mrkvickova, M.Bohdanecky (Inst. of Macromolecular Chem., Czechoslovak Acad. of Sci., Prague, Czechoslovakia).
Polym. Bull. (Germany), vol.10, no.3-4, p.191-5 (July 1983).
Dilute solutions of poly(N-butyl methacrylamide) in methanol, dimethylformamide, and cyclohexanone were investigated by light scattering, osmometry and viscometry. From the intrinsic viscosity data, the characteristic ratio, $C_\infty=9.9$, was estimated. This value is compared with those for other N-substituted polyacrylamides. The authors report on the solution properties of poly(N-butyl methacrylamide) (PBMAm) prepared by radical-initiated polymerization, namely, its solubility, determination of the molecular weight by light scattering and osmometry, correlation of the intrinsic viscosity with the molecular weight, and the configurational characteristics of the chain. 61.25M Liquid metals

101532 Structure and forces in simple liquid metals. I.Ebbsjo (Studvsik Sci. Res. Lab., Nykoping, Sweden), G.G.Robinson, N.H.March.
Phys. & Chem. Liq. (GB), vol.13, no.1, p.65-74 (1983).
Investigates the exact force equation for a classical monatomic liquid with pairwise interactions. This is handled by expanding the triplet correlation function $g^{(3)}$ in Legendre polynomials to yield $g'(r)+g(r)[\phi'(r)/k_BT]=(-4\pi\rho/3k_BT)\int s^2\phi'(s)Q_1(r,s)ds$, where $g(r)$ is the radial distribution function, $\phi(r)$ is the pair potential, ρ is the number density, while Q_1 is the $l=1$ term in the Legendre polynomial expansion of $g^{(3)}$. From molecular dynamics data for some simple liquids, the authors have calculated the left-hand-side of the equation. This has been used to draw some conclusions about the usefulness of the Kirkwood superposition approximation in extracting forces from structure. Used in the right way, the Kirkwood approximation yields a quantitative estimate of the three-body term in the force equation for Na, but is much less useful for argon. (12 refs.)

101533 Small *k*-behaviour of the structure factor of simple liquid metals and electron correlations. M.Silbert (Dept. of Phys., Ben Gurion Univ. of the Negev, Beer Sheva, Israel).
Phys. & Chem. Liq. (GB), vol.13, no.1, p.75-80 (1983).
Recent X-ray scattering data provides circumstantial evidence in support of the presence of a linear term in the small *k*-behaviour of the structure factor of simple liquid metals. The analysis of such data requires the liquid to be described as a binary mixture of electrons and ions, in which case qualitative arguments show that electron correlations are responsible for the above behaviour. (17 refs.)

101534 Structure factor of liquid alkali metals. H.B.Singh, A.Holz (Fachrichtung Theoretische Phys., Univ. des Saarlandes, Saarbrucken, Germany).
Phys. Rev. A (USA), vol.28, no.2, p.1108-13 (Aug. 1983).
Liquid alkali metals are treated as a system of charged hard spheres (CHS) in the background of interacting electrons. Such a system of CHS in a uniform background of electrons has been solved exactly by Palmer and Weeks (1973) in a mean spherical approximation. With the use of this model as a reference, the effect of responding electrons is taken into account in a linear-response approximation. The resulting expression for the structure factor involves the CHS diameter as the only free parameter and is very simple to compute. It reduces to the familiar Ashcroft-Lekner model (1966) when the charge on the hard spheres is taken to be zero. The results obtained for the static structure factor of all the alkali metals at different temperatures are in excellent agreement with the experimental data. (30 refs.)

101535 Determination of the pair potential and the ion-electron pseudopotential for aluminum from experimental structure-factor data for liquid aluminum. M.W.C.Dharma-wardana, G.C.Aers (Div. of Phys., Nat. Res. Council, Ottawa, Canada).
Phys. Rev. B (USA), vol.28, no.4, p.1701-10 (15 Aug. 1983).
A method of inverting a given structure factor $[S(k)]_{\text{expt}}$ of a liquid metal using a hypernetted-chain equation containing bridge-diagram contributions is

presented. Starting from a parametrized local pseudopotential and a parametrized model local field (or a theoretical local field), a pair potential is constructed. The $S(k)$ calculated from it is fitted to the given $[S(k)]_{\text{expt}}$. The method is first applied to a molecular-dynamics-generated $S(k)$ derived from an ab initio aluminum, potential and shown to yield the pair potential, the pseudopotential, and the charge density in excellent quantitative agreement with the original ab initio potential and other quantities. The method is then applied to the experimental $S(k)$ of aluminum from X-ray data at 943K. The Al-Al pair potential, Al-electron pseudopotential, and electron charge densities as well as the electron-gas response function (i.e. the model local field) are obtained selfconsistently, to within the accuracy of the experimental data. The calculated electrical resistivity is in excellent agreement with experiment. These investigations provide a comparative examination of the electron-gas local fields of Geldart-Taylor (1970), Vashista-Singwi (1972), Ichimaru-Utsumi (1981), and the density-functional local-density approximation. The hard-sphere parameter defining the bridge term is found to be essentially the same for the different ion-ion potentials determined from all but one of the different local fields, thus supporting the 'universality' hypothesis of Rosenfeld and Ashcroft (1979). (35 refs.)

101536 Stacking density of atoms in liquid metals. A.V.Vasiliadi.
Russ. Metall. (GB), no.4, p.62-3 (1981). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.4, p.71-2 (1981). [received: June 1983]
The values of the coefficient of stacking of atoms in liquid metals, used by a number of authors (0.45-0.48), are too low. It was found that the value is closer to 0.69-0.72. (4 refs.)

Mechanism of structural transformations in liquid metals ..... See Entry 101940

61.30 LIQUID CRYSTALS

(see also 64.70M Transitions in liquid crystals)

101537 Liquids with cubic orientational order—the cholesteric blue phase. S.Shtrikman (Dept. of Electronics, Weizmann Inst. of Sci., Rehovot, Israel).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.695 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
Summary form only given. Using Landau theory, the author shows why three-dimensional orientational order emerges. Models are presented of this orientational order for various blue phases and the implication for the selection rules for Bragg reflection discussed. These turn out to be different from the classical crystallographic ones. The physical reason for this difference is explained and the role of polarization emphasized. Some properties of the blue phases, including optical activity, light scattering and phase diagrams in the temperature-chirality plane are discussed and compared with experiment. (no refs.)

101538 Electrohydrodynamic domain patterns in freely suspended layers of nematic liquid crystals with negative dielectric anisotropy. S.Faetti, L.Fronzoni, P.A.Rolla (Istituto di Fisica, Univ. di Pisa, Pisa, Italy).
J. Chem. Phys. (USA), vol.79, no.3, p.1427-33 (1 Aug. 1983).
The electrohydrodynamic domain patterns observed in freely suspended layers of nematic liquid crystals with negative dielectric anisotropy are investigated. Two different domain patterns, in low and high frequency electric fields, occur. Both the director lines and the hydrodynamic flow lines associated with these patterns are investigated in detail. The threshold voltage of the instability is measured as a function of thickness and distance between the electrodes. The experimental results agree with a two-dimensional theoretical approach based on the Carr-Helfrich's model. (29 refs.)

101539 A systematic density functional approach to the mean field theory of smectics. M.D.Lipkin, D.W.Oxtoby (James Franck Inst., Univ. of Chicago, Chicago, IL, USA).
J. Chem. Phys. (USA), vol.79, no.4, p.1939-41 (15 Aug. 1983).
The authors present a systematic density functional approach to the mean field theory of the isotropic-nematic-smectic *A* transition. They show that their theory is a generalization of the McMillan theory of smectics (1971, 1972) and point out that an additional term arises in the free energy which was not present in the earlier work. Their approach provides a starting point for the investigation of chemical effects on liquid crystal phase transitions. (11 refs.)

101540 Small-angle Newton scattering from H_2O/D_2O solutions of a sodium alkylbenzenesulfonate having a branched alkyl group (neutron scattering). R.Triolo (Istituto di Chimica Fisica, Palermo, Italy), J.B.Hayter, L.J.Magid, J.S.Johnson,Jr..
J. Chem. Phys. (USA), vol.79, no.4, p.1977-80 (15 Aug. 1983).
Small-angle neutron scattering results from 0.055 *M* sodium *p*(1-penthylheptyl)benzenesulfonate solutions in D_2O-H_2O solutions of 57% to 100% volume percent D_2O are reported. Strong interaction peaks indicate interparticle ordering. Good fits to the results can be obtained taking account of hard-sphere and electrostatic repulsion with the mean spherical approximation. The model used is a spherical micelle, comprising a hydrocarbon core of 11.9 Å radius surrounded by a shell. The thickness of the shell derived from the results is 8.9 Å, implying a rough micellar surface. The measured geometry and charge are essentially independent of the contrast between the micelles and the solvent. (19 refs.)

101541 Remarks on the flow alignment of disc like nematics. T.Carlsson (Inst. of Theoretical Phys., Chalmers Univ. of Technol., Goteborg, Sweden).
J. Phys. (France), vol.44, no.8, p.909-11 (Aug. 1983).
The nature of the flow alignment of nematic liquid crystals is discussed within the hydrodynamic theory of Leslie, Ericksen and Parodi. It is shown that there is a limited range of angles for which flow alignment can occur. With this as a starting point the flow alignment of disc like nematics is discussed. It is proved that only one out of the two models of flow alignment recently discussed in the literature is consistent with hydrodynamic theory of nematics. (9 refs.)

101542 New contribution to spontaneous polarization of ferroelectric liquid crystals. E.P.Pozhidaev, L.A.Beresnev, L.M.Blinov, S.A.Pikin (Inst. of Crystallography, Acad. of Sci., USSR).
JETP Lett. (USA), vol.37, no.2, p.88-92 (20 Jan. 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.2, p.73-6 (20 Jan. 1983).
Experiments and theory have shown that a new component of spontaneous polarization exists in chiral smectics *C*, proportional to the cube of the angle of inclination of the molecules and characterized by a small relaxation time. (6 refs.)

101543 Stability of filaments of discotic liquid crystals. V.G.Kamenski, E.I.Kats (L.D. Landau Inst. of Theoretical Phys., Acad. of Sci., USSR).
JETP Lett. (USA), vol.37, no.5, p.261-4 (5 March 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.5, p.221-3 (5 March 1983).
The stability of a cylindrical specimen of a discotic liquid crystal is investigated. The critical value of the radius, beginning at which the cylindrical shape is stable, is found. For smaller radii, the maximum permissible length of the cylinder is determined. (6 refs.)

101544 Principal electro-hydrodynamic instability types in nematic liquid crystals. C.Rymarz.
J. Tech. Phys. (Poland), vol.23, no.2, p.103-10 (1982).
Fundamental problems connected with the study of threshold instabilities in nematic liquid crystals have been discussed briefly in the linear approximation, giving applicability ranges of the results hitherto obtained by disregarding the principle of conservation of moment of momentum. In addition the essential meaning of the simplifications introduced is pointed out, in which wave instability effects are neglected. The necessity of more rigorous application of the theory of equations with periodic coefficients to which reduce problems of alternating current instabilities is also emphasised. It is inferred that the study of instabilities in liquid crystals is very important from the heuristic and practical point of view, bearing in mind the fact that many liquid crystal substances have been detected in living organisms and are used for information displays. (12 refs.)

101545 Surface order in nematics. H.A.Van Sprang (Philips Res. Labs., Eindhoven, Netherlands).
Mol. Cryst. & Liq. Cryst. (GB), vol.97, no.1-4, p.255-61 (1983). (Proceedings of the Ninth International Liquid Crystal Conference, Bangalore, India, 6-10 Dec. 1982).
Interfaces have been studied between a liquid crystal and either glass or an evaporated SiO_x (60°) layer. Experimental results are discussed from both residual birefringence measurements in the isotropic phase and studies of the influence on the director of an in-plane magnetic field at the phase transition from isotropic to nematic. These data show that on pyrex an ordered interfacial layer exists while on SiO_x (60°) a multidomain structure is present at the surface. Comparison with literature data from nematic phase experiments shows that additional experiments with the isotropic phase and at the phase transition are vital for an understanding of the interfacial phenomena leading to liquid crystal anchorage. (9 refs.)

101546 Computer simulation of molecular dynamics of anisotropic fluids. D.Decoster, E.Constant (Centre Hyperfrequences et Semiconducteurs, Univ. des Sci. et Tech. de Lille, Villeneuve D'Ascq, France), M.Constant.
Mol. Cryst. & Liq. Cryst. (GB), vol.97, no.1-4, p.263-76 (1983). (Proceedings of the Ninth International Liquid Crystal Conference, Bangalore, India, 6-10 Dec. 1982).
Molecular dynamics calculations have been performed for fluid systems containing ellipsoidal particles which interact pair-wise with a modified Lennard-Jones potential. Assuming molecular parameters close to those of the CB7 compound, the authors have calculated both static and dynamic properties such as the internal energy, the entropy and specific heat changes at T_{NI}, the compressibility factor, the temperature dependence of the orientational order parameters, the reorientational angular momentum and velocity time-dependent self-correlation functions, and the diffusion coefficients in both the nematic and isotropic phases. The thermodynamical data show a transition between isotropic and nematic phases and the results obtained are in qualitative agreement with the experimental data. The influence of a decentered dipole along the molecular axis has been studied and partially bilayered smectic phases have been obtained. (22 refs.)

101547 Multiplexible liquid crystalline broad range systems. L.Pohl, B.Scheuble, G.Weber.
Mol. Cryst. & Liq. Cryst. (GB), vol.97, no.1-4, p.277-86 (1983). (Proceedings of the Ninth International Liquid Crystal Conference, Bangalore, India, 6-10 Dec. 1982).
A sharp steepness, a low temperature dependence of the threshold, and a fast response time at low temperatures are preconditions for the multiplexibility of liquid crystals suitable for outdoor application. The steepness is efficiently improved if $K_3/K_1 \leq 1$. A temperature independent steepness and threshold can be realized if K_3/K_1 and $\Sigma K_1/\Delta\epsilon$ become constant. Response time is proportional to γ_1/K_1. Since viscous properties change by 1 to 2 of the tenth power more than elastic constants with temperature, a fast response behavior at low temperature is possible only by reducing the temperature dependence of the viscosity. Taking into account these preconditions, it is possible to develop nematic systems multiplexible up to 1:8 from −20°C to +60°C without temperature compensation of the driving voltage or with temperature compensation up to 1:16, having a total response time less than 1 s even below −20°C. (5 refs.)

101548 Thermotropic transition metal complexes discogens and their smectogenic intermediates. A.-M.Godquin-Giroud (Dept. de Recherche Fondamentale, CENG, Grenoble, France), J.Billard.
Mol. Cryst. & Liq. Cryst. (GB), vol.97, no.1-4, p.287-95 (1983). (Proceedings of the Ninth International Liquid Crystal Conference, Bangalore, India, 6-10 Dec. 1982).
The series of the first thermotropic transition metal complexes discogens is completed: bis(*p*-*n*-alkylbenzoyl)methanato copper (II) including one derivative possessing two sorts of side chains. The symmetrical and unsymmetrical members of this series exhibit the same very organized discophase. The intermediates for the synthesis, the bis(*p*-*n*-alkylbenzoyl)methanes with two identical or different side chains, containing more than 18 carbon atoms exhibit the same very organized optically biaxial and positive smectic phase. The existence of another smectic phase stable at lower temperatures is established for a symmetrical term of this series. (25 refs.)

101549 Observations of electrically surface-induced regular arrays of focal conics in a homeotropic NPOB smectic A liquid crystal. H.P.Hinov, N.Shonova, K.Avramova (Inst. of Solid State Phys., Sofia, Bulgaria).
Mol. Cryst. & Liq. Cryst. (GB), vol.97, no.1-4, p.297-315 (1983). (Proceedings of the Ninth International Liquid Crystal Conference, Bangalore, India, 6-10 Dec. 1982).
Regular arrays of confocal pairs of ellipse-hyperbola with Marignan-Malet-Parodi association were observed in the boundary regions of a smectic A NPOB liquid crystal after cooling of a homeotropic nematic layer subjected to the action of a transversal high-frequency electric field with a sufficient strength. These smectic A textures exist as a storage mode after the removal of the electric field. Their distribution and sizes depend on the surface energy which has been determined to be in the range of 5×10^{-3} erg/cm^2 for a clear or lecithin-coated glass plate. In hybrid-aligned planar-homeotropic smectic A layers under the same conditions simultaneously exist parabolic focals and edge-dislocations near the glass plate where the surface orientation is planar and regular arrays of confocal pairs of ellipse-hyperbola near the glass plate where the surface orientation is homeotropic. The regular arrays of confocal

domains might be used as diffraction gratings whereas the nonregular strong-scattering arrays obtained at lower electric fields might be used in the indicator technique. (37 refs.)

101550 Field-induced order in nematic liquid crystals. P.Palffy-Muhoray (Dept. of Phys., Univ. of British Columbia, Vancouver, BC, Canada), D.A.Dunmur.
Mol. Cryst. & Liq. Cryst. (GB), vol.97, no.1-4, p.337-49 (1983). (Proceedings of the Ninth International Liquid Crystal Conference, Bangalore, India, 6-10 Dec. 1982).
The effect of an external magnetic field on the orientational order of a nematic liquid crystal has been examined using both Landau-de Gennes and Maier-Saupe theories. In the Maier-Saupe approach a rotationally invariant form of the pseudo-potential is introduced, which in the absence of an external field leads to three degenerate isomorphic solutions for the order parameter, corresponding to alignment along three principal axes; a similar result is obtainable from the Landau-de Gennes theory. Application of a magnetic field lifts the degeneracy of these solutions, and for materials having a positive diamagnetic susceptibility anisotropy, the uniaxial solution with alignment along the field direction is always energetically favorable. For materials with a negative susceptibility anisotropy, a biaxial solution minimizes the free energy at low temperatures, but on increasing the temperature there is a transition from a biaxial phase to an uniaxial phase. The field dependence of the transition temperatures is evaluated, and for positive materials there is a critical field, corresponding to a second order transition above which the nematic and isotropic phases are indistinguishable. A contrasting behavior is predicted for negative materials, and above a certain critical field the biaxial/uniaxial transition changes from first order to second order. For weakly ordered systems it is shown that the Landau-de Gennes expression for the free energy is identical to that obtained from the Maier-Saupe theory. However, for more ordered systems, the results of the two approaches differ, and in particular the Maier-Saupe theory predicts a susceptibility divergence temperature T^* which increases with applied field. (13 refs.)

101551 Induced smectic mesomorphism in binary mixtures of cholesteryl chloride and 4,4′-diheptyloxyazoxybenzene. K.A.Suresh (Raman Res. Inst., Bangalore, India).
Mol. Cryst. & Liq. Cryst. (GB), vol.97, no.1-4, p.417-21 (1983). (Proceedings of the Ninth International Liquid Crystal Conference, Bangalore, India, 6-10 Dec. 1982).
The authors report occurrence in an ‘induced smectic A’ phase in binary mixtures of cholesteryl chloride (ChCl) and 4,4′-diheptyloxyazoxybenzene (HOAB). It is interesting to find that cholesteryl chloride, which is not as strongly polar as cyano- or nitro group containing aromatic nematogens, gives rise to the induced smectic phase. X-ray studies on ChCl, HOAB and their mixtures show that neither the pure compounds nor the mixtures have a bilayer arrangement of molecules. The interesting result is obtained that in a 12 mole pct ChCl in HOAB mixture, which exhibits a twisted smectic C phase and a skew-cybotactic cholesteric phase, the tilt angle varies with temperature, although in the corresponding smectic C and skew-cybotactic nematic phases of pure HOAB, the tilt angle is independent of temperature. (8 refs.)

101552 On the possibility of a smectic-A phase in paraffins. A.Holz (Fachrichtung Theoretische Phys., Univ. des Saarlandes, Saarbrucken, Germany).
Phys. Lett. A (Netherlands), vol 96A, no.9, p.475-9 (1 Aug. 1983).
It is proposed that for paraffins $(CH_2)_N$ and N not too large melting may not lead immediately to an isotropic fluid but first to a layered liquid state with smectic-A properties. (8 refs.)

101553 Relieving cholesteric frustration: the blue phase in a curved space. J.P.Sethna, D.C.Wright, N.D.Mermin (Lab. of Atomic & Solid State Phys., Cornell Univ., Ithaca, NY, USA).
Phys. Rev. Lett. (USA), vol.51, no.6, p.467-70 (8 Aug. 1983).
The problem of minimizing the full cholesteric free energy in flat space is difficult since the bending and bulk energies favor different forms of the order parameter. It is shown, however, that the problem can be solved exactly on the surface of a sphere in four-space, where the curvature relieves the strains induced by the ‘double twist’. The conventional Landau bulk free energy leads to a rigorously uniaxial structure. The model is also of interest as a simple and explicit example of the ideas underlying recent theories of glasses. (20 refs.)

101554 Field-induced first-order orientation transitions in ferroelectric liquid crystals. M.A.Handschy, N.A.Clark (Dept. of Phys., Univ. of Colorado, Boulder, CO, USA), S.T.Lagerwall.
Phys. Rev. Lett. (USA), vol.51, no.6, p.471-4 (8 Aug. 1983).
Two new effects specific to ferroelectric liquid crystals are described: (a) ferroelectric polar surface interactions and (2) spontaneous splay of the polarization. It is shown that a consequence of these effects is the possibility of first-order reorientation transitions induced by applied electric fields. (8 refs.)

101555 The structure of liquid crystalline aromatic copolyesters prepared from 4-hydroxybenzoic acid and 2-hydroxy-6-naphthoic acid. G.A.Gutierrez, R.A.Chivers, J.Blackwell (Dept. of Macromolecular Sci., Case Western Reserve Univ., Cleveland, OH, USA), J.B.Stamatoff, H.Yoon.
Polymer (GB), vol.24, no.8, p.937-43 (Aug. 1983).
X-ray methods have been used to investigate the structure of liquid crystalline copolyesters prepared from 4-hydroxybenzoic acid (HBA) and 2-hydroxy-6-naphthoic acid (HNA). Fibre diagrams and meridional diffractometer scans have been obtained for melt-spun specimens of five HBA/HNA ratios: 25/75, 30/70, 50/50, 58/42 and 75/25. The data indicate a high degree of axial orientation. The lateral packing is more irregular but the observation of some equatorial and off-equatorial Bragg reflections indicates the presence of some three-dimensional order. The patterns differ in the number and position of the meridional maxima, and these can be predicted accurately by a point model for aperiodic chains of totally random sequence. (12 refs.)

61.40 AMORPHOUS AND POLYMERIC MATERIALS

(see also 64.70P Glass transitions 81.20P to 81.20T, and 81.60 Materials science)

101556 Amorphous metals: materials and applications. H.Warlimont (Vacuumschmelze GmbH, Hanau, Germany).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.281-91 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
A survey is given of the alloy design criteria, fundamental structure-property relations, present materials and main applications of amorphous metals. (10 refs.)

101557 Radial distribution analysis of amorphous carbon. C.A.Majid (Internat. Centre for Theoretical Phys., Trieste, Italy).
J. Non-Cryst. Solids (Netherlands), vol.57, no.1, p.137-45 (Aug. 1983).
The radial distribution analysis of amorphous carbon obtained from graphite is discussed. The various interatomic distances obtained were 1.44 Å, 2.57 Å and 3.8 Å. The coordination numbers for the first, second and third coordination spheres for this form of amorphous carbon were noted to be 3.15, 10.7 and 16.5 respectively. Values of the interatomic distances and the coordination numbers were found to lie between those for graphite and diamond. (34 refs.)

101558 Charged dangling bonds and crystallization in group IV semiconductors. P.J.Germain, M.A.Paesler, D.E.Sayers (Dept. of Phys., North Carolina State Univ., Raleigh, NC, USA), K.Zellama.
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.135-40
Crystallization of amorphous Ge (or Si) has been studied as a function of temperature and the flux of ionizing radiation (or doping). The crystallization growth rate v_g takes on the form $v_g=v_0 \exp(-E/kT)$ where v_0 is an increasing function of flux (or doping). The authors propose the following to explain these data: A concentration of mobile dangling bonds (DBs) exists in the bulk and near the amorphous-crystalline (a-c) interface. Ionization and doping induce transitions from the uncharged state D^0 to the charged states D^+ and D^-. The process controlling crystallization resulting in the above activation energy is discussed. Only certain sites on the a-side of the a-c interface are available for crystallization, and these sites are those which have captured DBs. The charged D^+ and D^- states have a larger capture cross section than the uncharged D^0 state. Increased concentrations of charged DBs results in an enhancement of the prefactor in the above equation. (22 refs.)

101559 Explosive crystallization in a-Ge and a-Si: a review. D.Bensahel, G.Auvert (CNET-CNS, Meylan, France).
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.165-76
Self-sustained or explosive crystallization results on a-Si and a-Ge are reviewed and compared. CW laser experiments on a-Si allow to follow all the phenomena encountered, and to experimentally measure the crystallization front velocity. The published theories agree well with the experimental results on a-Si. Moreover, a-Ge presents the same behaviour as a-Si, but for a-Si, the high nucleation rate can induce a specific explosive growth. (31 refs.)

101560 Amorphous Si, crystallization and melting. J.M.Poate (Bell Labs., Murray Hill, NJ, USA).
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.263-71
Recent experiments dealing with the thermodynamics of crystallization and melting of amorphous Si are reviewed. Differential calorimetry measurements give the heat of crystallization of implanted, amorphous Si to be 11.3 ± 8 kJ/mole. Gibbs free energy calculation based on these measurements indicate that amorphous Si melts at a temperature of 1460K compared to the crystalline value of 1685K. Evidence for this reduced melting temperature also comes from rapid heating measurements using (a) structural information after solidification and (b) dynamic conductance measurements during the melt. Solid phase epitaxial regrowth experiments which apparently do not show such a depression in amorphous melting temperature are discussed. (17 refs.)

61.40D Glasses

101561 On the structure and properties of beryllium fluoride glasses containing CoF_2. W.Vogel, H.Reiss, J.Seifert (Dept. of Chem., Friedrich Schiller Univ. of Jena, Jena, Germany).
Glass Technol. (GB), vol.24, no.3, p.133-8 (June 1983). (Symposium on Halide and other Nonoxide Glasses, Cambridge, England, 23-26 March 1982).
Phase separation effects in binary CoF_2-BeF_2 glasses and ternary NaF-BeF_2-CoF_2 or KF-BeF_2-CoF_2 systems were studied and the distribution of Co ions was determined. The transmission in the visible and infrared region and also the magnetic moment in the temperature range 20-400°C showed that changes of colour are caused by changing absorption bands and not by changing coordination number. (14 refs.)

101562 The influence of fluorine upon the structural, chemical, and physical properties of phosphate glasses. J.J.Videau, J.Portier, B.Tanguy (Lab. de Chimie du Solide, CNRS, Talence, France).
Glass Technol. (GB), vol.24, no.3, p.171-2 (June 1983). (Symposium on Halide and other Nonoxide Glasses, Cambridge, England, 23-26 March 1982).
Owing to increased interest in fluoride and fluorophosphate glasses for their optical properties, it is interesting to understand the role of the fluorine ion when it is introduced into phosphate glasses. One series of fluorophosphate glasses studied were obtained by fluorination of $NaPO_3$ using NH_4HF_2 (I) and the other three were of the systems $NaPO_3$-AlF_3 (II), $NaPO_3$-FeF_3 (III), and $NaPO_3$-CaF_2-AlF_3 (IV). Structural studies were carried out using Raman spectroscopy, electron paramagnetic resonance and Mossbauer measurements. Structural models were proposed on the basis of these results. (6 refs.)

101563 Low temperature properties of metallic glasses. P.Doussineau (Lab. d'Ultrasons, Univ. Pierre et Marie Curie, Paris, France).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.269-79 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
The low temperature properties ($T \lesssim 1K$) of metallic glasses are reviewed. They include specific heat, thermal conductivity, acoustic propagation mostly in superconducting glasses. They are well explained by the existence of low-energy excitations in form of tunneling two-level systems. (40 refs.)

101564 Statistical topology of glasses. N.Rivier (Blackett Lab., Imperial Coll., London, England).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.307-13 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
The structure and properties of glasses are investigated from a topological viewpoint (the only geometry surviving the absence of metric and the triviality of the space group), with two main results: the overall homogeneity is a gauge symmetry and the only structurally stable constituents (in the elastic continuum limit) are odd lines or 2π-disclinations. The universal properties of glasses are immediate consequences of these results. Their structure corresponds to statistical equilibrium, i.e. to the most probable distribution of their constituents. Odd lines take up a semi-dilute distribution, and ideal space-filling cellular structures obey Lewis's law (1928). (20 refs.)

101565 Structural glasses and $Rb_{1-x}(NH_4)_xH_2PO_4$. E.Courtens (IBM Zurich Res. Lab., Ruschlikon, Switzerland).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.705-20 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
Disordered or frustrated cooperative systems pose some major unsolved problems in solid-state physics. In magnetism, frustration can lead to condensation into spin glasses. Structurally frustrated systems are discussed, which lead to what is called by analogy 'structural glasses'. After a brief review of previous work, the author concentrates on the mixed system $Rb_{1-x}(NH_4)_xH_2PO_4$ in which ferroelectric and antiferroelectric tendencies compete. Dielectric, optical, structural, NMR, and thermal data are summarized which indicate a great resemblance to the spin glasses. A new aspect of the structural glasses are the large strictive effects which might help in producing and detecting real glass transitions. (53 refs.)

101566 Density fluctuation in a 'theorist's ideal glass'. Ryong-Joon Roe (Dept. of Materials Sci. & Metall. Engng., Univ. of Cincinnati, Cincinnati, OH, USA).
J. Chem. Phys. (USA), vol.79, no.2, p.936-8 (15 July 1983).
The density fluctuation in glassy materials can be considered to consist of dynamic and quasistatic contributions, the dynamic part being related to the compressibility of the glass determined on the same experimental time scale as the measurement of the density fluctuation. A justification for such an assumption, and a clarification of the meanings of the terms dynamic and quasistatic density fluctuation are obtained through the concept of 'theorist's ideal glass' which was originally described by Edwards for a canonical ensemble but now extended for a grand canonical ensemble. (13 refs.)

101567 Crystallization of the metallic glass $Fe_{80}B_{12}Si_8$. C.F.Chang, J.Marti (Corp. Res. & Dev., Allied Chem. Corp., Morristown, NJ, USA).
J. Mater. Sci. (GB), vol.18, no.8, p.2297-304 (Aug. 1983).
Crystallization of the metallic glass $Fe_{80}B_{12}Si_8$ has been studied by differential scanning calorimetry, X-ray diffraction and transmission electron microscopy. Samples were annealed isothermally for 15 to 1400 min between 633 and 753K. The crystalline phases observed are α(Fe,Si) and Fe_3B in sequence, with dendritic and cylindrical morphology, respectively. The distribution of α(Fe, Si) particles is rather uniform in the bulk but very non-uniform near both surfaces. The growth of these particles obeys a $t^{1/2}$ law and is diffusion controlled. (17 refs.)

101568 Silver sulfide based glasses. I. Glass forming regions, structure and ionic conduction of glasses in Ge_2-Ag_2S and GeS_2-Ag_2S-AgI systems. E.Robinel (Lab. d'Energetique Electrochimique, Saint-Martin d'Heres, France), B.Carette, M.Ribes.
J. Non-Cryst. Solids (Netherlands), vol.57, no.1, p.49-58 (Aug. 1983).
Ag_2S forms with GeS_2 stable glasses over a wide range of compositions (0-55% Ag_2S mol%). In the same system, more complex glasses obtained by dissolving silver iodide have been synthesized with up to 50 mol% AgI. Raman spectra are presented and a vibrational assignment in terms of bridging and nonbridging sulfur has been made. The electrical conductivity of these glasses has been measured over a temperature range (−50△C-+50°C) and for various compositions by the complex impedance diagram method. At 25°C, the coductivity reached a maximum value of $6 \times 10^{-3}\ \Omega^{-1}\ cm^{-1}$. Whatever the glass used, the same limit value of conductivity ($\sigma \simeq 10^{-2}\ \Omega^{-1}\ cm^{-1}$) and activation energy ($E_\sigma \approx 0.25$ eV) are obtained for the highest content of silver iodide. A conduction mechanism is proposed. (20 refs.)

101569 Molecular dynamics studies of the structure and atomic motion of BeF_2 glass. K.Hirao, N.Soga (Dept. of Industrial Chem., Kyoto Univ., Kyoto, Japan).
J. Non-Cryst. Solids (Netherlands), vol.57, no.1, p.109-17 (Aug. 1983).
Molecular dynamics calculations were performed on the glassy state of BeF_2, by assuming a pair potential of the Born-Mayer-Huggins type. From the pair correlation functions for the like- and unlike-charge pairs, the coordination number and the mean near-neighbor distance were obtained and compared with the published data of X-ray diffraction studies. With its use of computer-generated graphics, the characteristics of ionic motions were also examined. (11 refs.)

101570 Study of structural relaxation of $ni_{78}Si_8B_{14}$ metallic glass by electrical resistivity and thermal expansion. T.Komatsu, M.Takeuchi, K.Matusita, R.Yokota (Dept. of Materials Sci. & Technol., Technol. Univ. of Nagaoka, Nagaoka, Japan).
J. Non-Cryst. Solids (Netherlands), vol.57, no.1, p.129-36 (Aug. 1983).
Electrical resistivity and thermal expansion measurements were made to elucidate the structural relaxation of $Ni_{78}Si_8B_{14}$ metallic glass especially, the topological short range ordering. The decrease of resistivity and the increase of its temperature coefficient were observed, and these changes due to the structural relaxation were discussed on the basis of the extended Ziman theory for metallic glasses proposed by Nagel (1977). The densification of about 0.25% and the decrease of 4% in the thermal expansion coefficient were observed in the considerably relaxed sample. The topological short range ordering in $Ni_{78}Si_8B_{14}$ metallic glass occurs rapidly at the annealing temperature above 200°C. (23 refs.)

101571 Calorimetric study of crystalline in $(GeSe_2)_x(GeTe_4)_{1-x}$ glasses. S.Bordas, M.Geli, M.T.Clavaguera-Mora (Facultad de Ciencias, Univ. Autonoma de Barceolona, Barcelona, Spain), N.Clavaguera.
J. Non-Cryst. Solids (Netherlands), vol.57, no.1, p.195-8 (Aug. 1983).
Compositions of general formula $(GeS_2)_x(GeTe_4)_{1-x}$ are easy to obtain as glasses from quenching of the melt. The authors report a calorimetric study of the structural transformations characteristic of the glassy state and on their relation to the equilibrium phase diagram. DSC and DTA analyses were performed using a DSC II Perkin-Elmer and a TA 429 Netzsch Thermal Analyzer, respectively. (5 refs.)

101572 X-ray diffraction study of the structure of silicate glasses. I. Alkali metasilicate glasses. I.Yasui, H.Hasegawa, M.Imaoka (Inst. of Industrial Sci., Univ. of Tokyo, Tokyo, Japan).
Phys. & Chem. Glasses (GB), vol.24, no.3, p.65-71 (June 1983).
As one of a series of studies of silicate glasses, the structures of alkali metasilicate glasses were studied by X-ray diffraction. R_2O-SiO_2 (R=Li, Na, K, Cs) glasses were prepared and radial distribution functions were obtained from the X-ray measurement. Models were constructed and radial distribution functions were calculated by using the pair function method, which makes it possible to minimise the errors of overall analysis. The best models were selected by comparing the agreement between calculated and observed radial distribution functions. The structures of the alkali metasilicate glasses were found to consist of $(SiO_3)0_\infty$ straight chains, and the bending angles of the chains were mainly determined by a geometrical factor, i.e. the sizes of alkali ions and pockets between the chains. These analyses of alkali metasilicate glasses show that the intermediate range structural order (within a few angstroms) is quite high and a single model can explain the observed radial distribution functions. (17 refs.)

101573 X-ray diffraction study of the structure of silicate glasses. II. Alkali disilicate glasses. M.Imaoka, H.Hasegawa, I.Yasui (Inst. of Industrial Sci., Univ. of Tokyo, Tokyo, Japan).
Phys. & Chem. Glasses (GB), vol.24, no.3, p.72-8 (June 1983).
For pt.I see ibid., vol.24, no.3, p.65 (1983). The structures of two disilicate glases, $Na_2O.2SiO_2$ and $Li_2O.K_2O.4SiO_2$, have been determined by the pair function analysis of radial distribution curves obtained from X-ray diffraction data. Their structures are similar to the corresponding crystal structures and consist of sheets containng six-membered rings of SiO_4 tetrahedra. The two alkali ions are situated between the layers and are accommodated in the space formed by nonbridging oxygen atoms belonging to the two layers. In the mixed alkali glass, a bending of the layers makes different sizes of site available for the two types of alkali ion to occupy in accordance with their ionic sizes and this leads to a layer consisting of two types of chain each with one type of alkali ion.These structures are discussed in relation to ionic conductivity and the influence of the mixed alkali effect on ionic conductivity. The structures as described have been found to account successfully for these phenomena. (11 refs.)

101574 Elastic constants and structure of the vitreous system H_2O-P_2O_5. N.D.Patel, B.Bridge, D.N.Waters (Brunel Univ., Uxbridge, England).
Phys. & Chem. Glasses (GB), vol.25, no.5, p.122-9 (Oct. 1983).
The elastic moduli of the entire vitreous range of the system H_2O-P_2O_5 (0 to 50 mol.% H_2O) have been measured and the data used to suggest which of several alternatives (chain, molecular, three dimensional network, etc.) are the most likely structures for this glass system. Details are presented of thermal histories and the conditions required for the preparation of glasses in a form suitable for ultrasonic measurements. Possible methods for the assessment of water content are reviewed. In practice the use of proton nuclear magnetic resonance on solutions of the glasses in high purity deuterium oxide was found to be very successful. The ultrasonic method found suitable for the necessarily rapid yet accurate velocity measurements on these highly hygroscopic glasses is described. (10 refs.)

101575 Atomic structure of SiS_2 and $SiSe_2$ glasses. M.Tenhover, M.A.Hazle, R.K.Grasselli (Sohio Res. Center, Standard Oil Co., Warrensville Heights, OH, USA).
Phys. Rev. Lett. (USA), vol.51, no.5, p.404-6 (1 Aug. 1983).
The first study of the automatic structure of Si chalcogenide glasses is reported. The Raman spectra are remarkably simple and can be understood in terms of the vibrations of a bitetrahedral $Si_2(X_{1/2})_8$ (X=S,Se) unit. The

present results represent the most compelling evidence for medium-range order and a molecular-cluster description of a compound amorphous semiconductor. (9 refs.)

101576 On the annealing behaviour and crystallization of the amorphous alloy $Fe_{40}Ni_{40}P_{14}B_6$. R.Hohne, H.Borner, M.Krotzsch (Sektion Phys., Karl-Marx-Univ. Leipzig, Leipzig, Germany).
Phys. Status Solidi a (Germany), vol.78, no.1, p.211-16 (16 July 1983).
Samples of the amorphous system $Fe_{40}Ni_{40}P_{14}B_6$ are investigated in the as-quenched state as well as after heat treatments in the temperature range between 23 and 525°C. It is shown that the measurement of the field dependence of the damping of free torsional vibrations of a sample in a homogeneous magnetic field is a very sensitive method, yielding information about the quality of the amorphous alloys with respect to the existence of a second ferro- or ferrimagnetic phase or of crystalline grains, and the beginning of crystallization. By means of magnetic measurements and differential thermal analysis the existence of a second phase in the samples used could be detected. Both phases participate in the crystallization process. (14 refs.)

101577 Theory of doping in chalcogenide glasses. P.Nagy (Inst. of Phys., Acad. of Sci., Bratislava, Czechoslovakia).
Philos. Mag. B (GB), vol.48, no.1, p.47-54 (July 1983).
The concentration dependence of the Fermi energy and related quantities is investigated theoretically. Owing to the finite width of the gap states the Fermi energy changes relatively slowly with increasing concentration of ionized impurities. Acceptor-and donor-like impurities are found to alter the Fermi energy and the conductivity in different ways. (16 refs.)

101578 Theory of formation of metallic glasses. II. J.Hafner (Inst. fur Theoretische Phys., Tech. Univ. Wien, Wien, Austria).
Phys. Rev. B (USA), vol.28, no.4, p.1734-9 (15 Aug. 1983).
For pt.I see ibid., vol.21, no.2, p.406 (1980). Low-temperature limits for the metastability of the supercooled liquid state are derived from a thermodynamic perturbation calculation. Together with a previously published calculation of the energetics of solid and liquid alloy phases, this allows for an ab initio determination of the glass-forming ability of metallic alloys. (24 refs.)

101579 Preparation of fluoride glasses based on heavy metals. Optical transmission studies. G.Fonteneau, A.El Houari, J.Lucas (Univ. de Rennes-Beaulieu, Rennes, France).
Rev. Chim. Miner. (France), vol.20, no.3, p.321-8 (1983). In French.
Multicomponent glasses based on Th:Ba fluorides have been prepared in the quaternary system BaF_2-ThF_4-YF_3-ZnF_2. Their stabilization has been studied versus the percentage of BaF_2. These materials exhibit a very broad transmission plateau ranging from 0.3 μm to 8 μm. Very low intrinsic absorption values $\simeq 10^{-8}$ cm^{-1} are to be expected in the 3-4 μm region. (10 refs.)

101580 Disorderly crystal structures in transition metal rich-metalloid alloys: implications for glass formation. R.E.Watson (Phys. Dept., Brookhaven Nat. Lab., Upton, NY, USA), L.H.Bennett.
Scr. Metall. (USA), vol.17, no.7, p.827-32 (July 1983).
Easy glass formation usually occurs near eutectics where the glass forming temperature is close to the melting point. Glass formation is favored when the crystal structure(s) of the compounds are complicated. The purpose of the authors is to see what transition metal rich-metalloid compounds have complicated structures and what implications this might have for glass formation. (14 refs.)

101581 Correspondence between the results of structural and thermodynamic studies of vitreous silica. S.V.Nemilov (S.I. Vavilov State Optical Inst., Leningrad, USSR).
Sov. J. Glass Phys. & Chem. (USA), vol.8, no.4, p.255-62 (July-Aug. 1982). Translation of: *Fiz. & Khim. Stekla (USSR)*, vol.8, no.4, p.385-94 (July-Aug. 1982). [received: May 1983]
A general expression for the excess energy of vitreous silica relative to α-quartz has been obtained in the simplest approximation of the force field of the valence bonds. The excess energy is calculated on the basis of the distribution functions of the Si-O-Si valence angles found from the X-ray structural data, the most probable values of the Si-O distance, and the elastic deformation constant of the Si-O-Si angle determined from the Raman spectra. Using the published structural data, this energy is 1665 ± 700 cal/mole SiO_2 and in principle is in agreement with the value of the excess internal energy from the thermodynamic calculation (1720 ± 120 cal/mole SiO_2). The correspondence among the thermodynamic, X-ray structural, and spectroscopic results of the study of vitreous silica is shown. (17 refs.)

101582 Properties and structure of glasses in the SiO_2-TiO_2 system. G.A.Pavlova (State Sci.-Res. Inst. of Vitreous Silica, Leningrad, USSR).
Sov. J. Glass Phys. & Chem. (USA), vol.8, no.4, p.263-72 (July-Aug. 1982). Translation of: *Fiz. & Khim. Stekla (USSR)*, vol.8, no.4, p.395-405 (July-Aug. 1982). [received: May 1983]
It has been found that direct structural methods can be used to establish the fourfold coordination of Ti ions in binary titanosilicate glasses with the presence of predominant Ti-O-Si bonds. With an increase in the concentration of TiO_2 in the glasses there is a decrease in the charge density and an increase in the degree of hybridization of the wave functions of titanium and oxygen. The data on the change in the various physicochemical properties as a function of the concentration of TiO_2 and with a change in temperature are in good agreement with these structural features of titanosilicate glasses. When the concentration of TiO_2 is increased above 12 mass% in the glasses Ti-O-Ti bonds appear; this corresponds to the boundary of metastable liquid-phase separation and is accompanied by an inflection on the composition-property curves for a series of properties. This particular collection of the properties of titanosilicate glasses indicates their promise as exploitable materials. (69 refs.)

101583 ESR study of the change in the local structure of As_2Se_3 caused by the action of high pressure and by annealing. E.A.Zhilinskaya, V.N.Lazukin, I.V.Chepeleva, V.A.Shanditsev (Sci.-Res. Inst. of Nuclear Phys., Moscow State Univ., Moscow, USSR).
Sov. J. Glass Phys. & Chem. (USA), vol.8, no.4, p.273-7 (July-Aug. 1982). Translation of: *Fiz. & Khim. Stekla (USSR)*, vol.8, no.4, p.406-11 (July-Aug. 1982). [received: May 1983]
Residual local changes in glassy As_2Se_3 treated at a high pressure of 77 kbar have been observed. The high-pressure treatment of glassy As_2Se_3 containing impurity Cr leads to an increase in the splitting of the Cr^{3+}-ion levels in zero magnetic field as a result of the reduction in the distance between the Cr^{3+} ions and their surrounding ligands. The total elimination of the changes in the local structure caused by the high pressure is only possible as a result of annealing at temperatures close to T_g. (14 refs.)

101584 Phase changes in copper halide photochromic glasses. V.V.Golubkov, V.A.Tsekhomskii (I.V. Grebenshchikov Inst. of Silicate Chem., Acad. of Sci., USSR).
Sov. J. Glass Phys. & Chem. (USA), vol.8, no.4, p.280-4 (July-Aug. 1982). Translation of: *Fiz. & Khim. Stekla (USSR)*, vol.8, no.4, p.416-21 (July-Aug. 1982). [received: May 1983]
Using an SAS method the melting and crystallization temperatures of the light-sensitive phase of copper halide photochromic glasses have been determined. A temperature region where supercooling of the copper halide phase occurs and the dependence of the melting and crystallization temperatures of the regions of nonuniformity (microcrystals) on their size have been observed. Other components, obviously NaCl, are included in the composition of the light-sensitive phase as well as CuCl. (6 refs.)

101585 Effect of the third component on the technical and elastic properties of phosphorus-containing glasses. G.M.Orlova (A.A. Zhdanov Leningrad State Univ., Leningrad, USSR).
Sov. J. Glass Phys. & Chem. (USA), vol.8, no.4, p.296-9 (July-Aug. 1982). Translation of: *Fiz. & Khim. Stekla (USSR)*, vol.8, no.4, p.435-8 (July-Aug. 1982). [received: May 1983]
The effect of Tl, Ge, and Te on the thermal and elastic properties of phosphorus selenide glass has been studied. The addition of the third component helps to strengthen the framework of the phosphorus selenide glass, to increase the values of the activation energy of viscous flow and the ultrasonic propagation velocity and to reduce the adiabatic compressibility and lower the thermal-expansion coefficient. The interconnection between the character of the change in the concentration dependence of the thermal and elastic properties and the structure-chemical composition of the experimental glasses has been considered. (12 refs.)

101586 Effect of water on the crystallization of Li_2O-SiO_2 glasses and gels. Z.J.Huang, T.Yoko, K.Kamiya, S.Sakka (Dept. of Industrial Chem., Faculty of Engng., Mie Univ., Tsu-shi, Japan).
Yogyo-Kyokai-Shi (Japan), vol.91, no.5, p.215-21 (1983). In Japanese.
The crystallization process of Li_2O-SiO_2 glass and lithium silicate gel powders has been investigated by means of differential thermal analysis, X-ray diffraction and infrared spectroscopy. The former was prepared by melting and contained 0.004~0.177 wt.% water and the latter, by hydrolyzing metal alkoxide solutions. It is found that with increasing water content in the glass, the glass transition temperature and the rate of nucleation decrease, whereas the rate of crystal growth increases. It is also found that gels prepared from a metal alkoxide solution show a crystallization process different from glasses prepared by the conventional melting method; the crystalline phase precipitated from the former is metastable lithium metasilicate Li_2SiO_3 and that precipitated from the latter is stable lithium disilicate $Li_2Si_2O_5$. The glass prepared by melting the gel shows a crystallization process similar to glasses prepared by melting crystalline powders when their water contents are similar. (24 refs.)

101587 Thermal cycling and amorphous-crystalline transition in the amorphous Cu_{60}-Zr_{40} alloy system. M.A.Otooni (US Army Armament Res. & Dev. Command Dover, NJ, USA).
Alloy Phase Diagrams. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.277-82
The transition behavior of the amorphous $Cu_{60}Zr_{40}$ alloy system during its transition to crystallinity by thermal cycling has been studied. A differential scanning calorimeter was used to record, in situ, the onset of thermal evolution of the sample during the course of transition. Analysis of DSC tracings reveal that transition occurs at a lower temperature than those transformed without thermal cycling. The amplitude of the exothermic rise decreases proportionally with increasing numbers of the thermal cycles. Details of the profile of the DSC tracing, i.e. the width of the exothermic rise and the presence of the secondary exotherm, are quite different from those transformed without thermal cycling. Preliminary high resolution electron microscopy of thermal cycled samples indicate random distribution of copper-rich precipitates at the early stages of cycling and their coalescence during the final stage of crystallization. For large number of cycles, however, the induced strains from thermal cycles contributes to the image contrast of the quenched solid thus allowing the assessment of the proposed atomic level stresses and strains, via technique of high resolution electron microscopy. (no refs.)

101588 Hydrogen solubility in $Pd_{100-x}Si_x$ metallic glasses and the phase diagram of Pd-Si-H glasses. R.S.Finocchiaro, C.L.Tsai, B.C.Giessen (Dept. of Chem., Northeastern Univ., Boston, MA, USA).
Alloy Phase Diagrams. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.283-7
The hydrogen solubility of glassy $Pd_{100-x}Si_x$ alloys with $14 \leq x \leq 22$ has been measured in the temperature range of 10°C to 90°C and the hydrogen partial pressure range of 0 to 100 torr. The absorption of hydrogen in these glassy alloys is exothermic and Sieverts' law is not observed. An isothermal-isobaric ternary phase diagram showing the change of hydrogen solubility with silicon concentration is given. A preliminary analysis suggests that the hydrogen solubility is related to the atomic structure of the metallic glasses. (10 refs.)

101589 Metallic glass formation diagrams. B.C.Giessen, S.H.Whang (Dept. of Chem., Northeastern Univ., Boston, MA, USA).
Alloy Phase Diagrams. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.289-94
The ability to predict ready glass formation (RGF) in binary alloy systems upon rapid cooling of the melt is of value both theoretically and practically. Two-dimensional maps show promise as a means of associating RGF with two system parameters which must have a combination of favorable values. Two types of glass formation diagrams are reviewed. One of these, the ΔH-r/R plot, is based on fundamental parameters which can, in principle, be derived from elemental quantities for each binary alloy system. The second type of diagram, the temperature-composition map, uses two equilibrium phase diagram features, namely reduced liquidus temperatures and reduced eutectic compositions to predict RGF. Both approaches are compared for binary alloys of Zr. The temperature-composition plot approach can be extended to predict qualitatively the RGF composition range of a given alloy system. (19 refs.)

101590 Metal doped fluorocarbon polymer films prepared by plasma polymerisation using an RF planar magnetron target. H.Biederman, L.Holland (Lab. for Plasma Materials Processing, School of Math. & Phys. Sci., Univ. of Sussex, Brighton, England).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.212, no.1-3, p.497-503 (1 July 1983).
Fluorocarbon films have been prepared by plasma polymerisation of CF_4 using an RF planar magnetron with an aluminium target. More than one order of magnitude higher deposition rate has been achieved in comparison with an RF diode system operated under similar conditions of monomer pressure and flow rate and power input. A glow discharge in a CF_4[25%]-argon [75%] mixture was used to incorporate aluminium from a target electrode into the polymer films. The foregoing mixture and another based on CF_4 [87%]-argon [13%] were used in the RF discharge with a copper target. Some experiments with a gold target and pure CF_4 as the inlet gas were also made. The film structure was examined by [SEM] and [TEM] and characteristic micrographs are presented. The composition of the films was estimated from an AES study. The sheet resistivity of the metal/polymer film complexes was determined. (17 refs.)

101591 Polymer glasses: defects and plasticity on a molecular scale. B.Escaig (Lab. des Structures et Proprietes de l'Etat Solide, Univ. de Lille I, Villeneuve d'Ascq, France).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.293-305 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
Discusses models of nonelastic deformation in glassy polymers. The physics of local defects in the chain arrangement is described together with predictions about flow parameters. It is shown that flow kinetics data give strong support to a localised dislocation loop mechanism as a realistic model to account for the mechanical behaviour of thermoplastics and thermoset resins. (22 refs.)

101592 Polymer physics: organization of macromolecules in the solid state. A.Keller (H.H. Wills Phys. Lab., Univ. of Bristol, Bristol, England).
Phys. Bl. (Germany), vol.39, no.7, p.178-80 (July 1983). In German.
The author provides a general introduction to polymer science with particular reference to the role of physics, aimed to give the background to those for whom the whole subject is an unfamiliar area. The second part deals with the states of organization in solid macromolecules. (no refs.)

101593 An application of Monte Carlo method to simulate disorders in polymer crystals. T.Yamamoto (Dept. of Phys., Yamaguchi Univ., Yamaguchi, Japan).
Polymer (GB), vol.24, no.8, p.943-8 (Aug. 1983).
The Monte Carlo method is applied to polymer crystals of idealized linear chain molecules of 30 carbon atoms, and the unharmonic, large-amplitude, oscillations and the subsequent conformational disorders of the chains are investigated. A crystalline field that confines the chain is treated by the molecular field approximation, and assumed to be cylindrical. A production type simulation is adopted taking into account rigorous statistical weights for each sample conformation. Both the rotational isomeric model and the continuous rotation model of chain conformation are considered. By averaging over 10^4-8×10^4 chains, mean-square end-to-end distance, fractions of gauche and trans states and a detailed distribution of internal rotation angle are obtained. (8 refs.)

101594 The morphology of poly(aryl-ether-ether-ketone). D.J.Blundell, B.N.Osborn (Petrochem. and Plastic Div., Imperial Chem. Industries plc, Cleveland, England).
Polymer (GB), vol.24, no.8, p.953-8 (Aug. 1983).
The morphology and related properties are described for the aromatic thermoplastic poly(aryl-ether-ether-ketone) (PEEK) $[C_6H_4\text{-}O\text{-}C_6H_4\text{-}O\text{-}C_6H_4\text{-}CO]_n$. Topics covered include crystallinity, crystallization and melting behaviour, lamellar thickness and spherulitic structure. The data are used to derive the following material parameters T_m=395°C, σ_e=49 erg cm^{-2}, σ_s=38 erg cm^{-} and ΔH_F=130 kJ kg^{-1}. PEEK is closely analogous to poly(ethylene terephthalate) in its crystallization behaviour except that the main transitions occur about 75°C higher. (8 refs.)

101595 The structure and elasticity of polyurethane networks. I. Model networks of poly(oxypropylene) triols and diisocyanate. M.Ilavsky, K.Dusek (Inst. of Macromolecular Chem., Czechoslovak Acad. of Sci., Prague, Czechoslovakia).
Polymer (GB), vol.24, no.8, p.981-90 (Aug. 1983).
The equilibrium mechanical and optical behaviour of networks prepared from poly(oxypropylene) triols (PPT) and 4,4′-diphenylmethane diisocyanate (MDI) at various initial molar ratios of reactive groups, r_H=[OH]/[NCO], in the range $0.6<r_H<1.75$ have been investigated. A comparison between experimental and theoretical (based on the theory of branching processes) dependences of the equilibrium modulus, G_e, on r_H or on the sol content, w_s, led to the following conclusions: In the range $r_H\geq1$ the theory adequately describes experimental dependences, while in the range $r_H<1$ excess crosslinking takes place. In PPT networks with a higher molecular weight (M_n=2630), G_e is about twice the theoretical value for the front factor A=1. The difference between the experimental and theoretical moduli for A=1/3 may be adequately described by using W. Langley's concept (1968) of trapped entanglement contribution. (39 refs.)

101596 Influence of molar mass and catalysts on the kinetics of crystallization and on the orientation of poly(ethylene terephthalate). B.Gumther, H.G.Zachmann (Abteilung Angewandte Chem., Univ. Hamburg, Hamburg, Germany).
Polymer (GB), vol.24, no.8, p.1008-14 (Aug. 1983).
Poly(ethylene terephthalate) with different molar masses and different catalysts and additives (calcium acetate, manganese acetate, triphenylphosphate) was synthesized. The influence of the molar mass distribution, and of the additives used, on the rate of crystallization was studied. Also the dependence of the orientation obtained during drawing at elevated temperatures on the drawing conditions, on the average molar mass, and on the additives was investigated. It is shown that, under the same drawing conditions, an increase in molar mass leads to greater orientation. Also, at very small draw rates the orientation in the samples containing calcium acetate is greater than in those containing manganese acetate. (16 refs.)

101597 Solvent induced crystallization of syndiotactic poly(methyl methacrylate). Relation to the formation of polymer aggregates in solution. [NMR and IR spectra]. J.Spevacek, B.Schneider, J.Baldrian, J.Dybal, J.Stokr (Inst. of Macromolecular Chem., Czechoslovak Acad. of Sci., Prague, Czechoslovakia).
Polym. Bull. (Germany), vol.9, no.10-11, p.495-501 (April 1983).
Solutions of syndiotactic (s) poly(methyl methacrylate) (PMMA) and samples of solid s-PMMA prepared from these solutions were studied by NMR and infrared (IR) spectroscopy and by wide-angle X-ray scattering (WAXS). IR spectra of s-PMMA films obtained from o-dichlorobenzene solutions by evaporation of solvent at room temperature have shown that the ordering of polymer chains which exists in aggregates of s-PMMA in o-dichlorobenzene is preserved in the solid state. s-PMMA prepared in this way is characterized as partly crystalline by WAXS. When o-dichlorobenzene is evaporated at elevated temperatures at which the aggregates of s-PMMA are decomposed, or if solid s-PMMA is obtained from solutions in which aggregation does not take place, the obtained solid polymer is amorphous. (10 refs.)

101598 Evidence of strain-induced phase separation in isopropyl azodicarboxylate modified polybutadiene. G.R.Hamed (Inst. of Polymer Sci., Univ. of Akron, Akron, OH, USA), C.-H.Shieh, D.N.Schulz.
Polym. Bull. (Germany), vol.9, no.10-11, p.525-32 (April 1983).
Polybutadiene (BR) has been modified by reaction with isopropyl azodicarboxylate (IAD). The reaction is quite efficient—resulting in a structure in which there are pendant hydrazoester groups dangling from the BR backbone. The cohesive strength and autohesion of BR are increased by the IAD modification. It is proposed that this polymer is capable of strain-induced phase separation (a mechanism of self-reinforcement). Evidence for this is the appearance of a new strain-induced thermal transition in the DSC scan of this material. (9 refs.)

101599 The rate of crystallization of poly(ethylene terephthalate) by differential scanning calorimetry. C.C.Lin (Dept. of Chem. Engng., New Jersey Inst. of Technol., Newark, NJ, USA).
Polym. Eng. & Sci. (USA), vol.23, no.3, p.113-16 (Feb. 1983). [received: July 1983]
The value of t_{max} in differential scanning calorimetry is correlated with the crystallization kinetics of poly(ethylene terephthalate) (PET). The Avrami exponent, n, obtained varies as a result of a change in slope of the curve at the point t_n, a secondary crystallization transition. The plot of t_n vs. t_{max} shows a linear relationship. The rate of crystallization depends upon both molecular weight and crystallization temperature. Under a nucleation controlling step, the plot of log t_{max} vs. $1/T^2\Delta T$ gives a linear relationship. Theoretical concepts of the treatments are discussed. (9 refs.)

101600 Physical properties of high-pressure ethylene vinylacetate copolymers and their saponified derivatives. R.J.Koopmans, R.Van Der Linden, E.F.Vansant (Dept. of Chem., Univ. of Antwerp, Wilrijk, Belgium).
Polym. Eng. & Sci. (USA), vol.23, no.6, p.306-17 (April 1983).
The physical properties of high-pressure ethylene vinylacetate (EVA) copolymers having an average melt index of 8.5 g/10 min and a mol.% of VA less than 20 are studied. A comparison is made with the properties of their saponified derivatives, the ethylene vinylalcohol (EVAl) co- and ethylene vinylalcohol vinylacetate (EVAlVA) terpolymers. A melt-index effect is noted. Density, thermal, and mechanical properties of EVA copolymers are determined by the degree of crystallinity, which depends on the mol.% VA and on the degree of alkyl shortchain branches. EVAlVa terpolymer properties depend on the residual mol.% VA. EVAl copolymers proved to have some properties similar to low-density polyethylene. The hydrogen-bonding effect via hydroxyl groups was negligible for this level of vinylalcohol incorporation. (27 refs.)

101601 Properties of polyisobutylene-polyurethane block copolymers. I. Macroglycols from ozonolysis of isobutylene-isoprene copolymer. T.A.Speckhard, G.Ver Strate, P.E.Gibson, S.L.Cooper (Dept. of Chem. Engng., Univ. of Wisconson, Madison, WI, USA).
Polym. Eng. & Sci. (USA), vol.23, no.6, p.337-49 (April 1983).
The properties of a series of polyisobutylene (PIB) based polyurethanes were studied and compared to those reported in the literature for polyether, polyester, and polybutadiene-based polyurethanes. Good phase separation was reflected in the invariance of the soft segment T_g with increasing hard segment content. Increasing hard segment content resulted in larger domains, higher modulus and lower ultimate elongation. The modulus above the soft segment T_g was higher than that previously reported for polyurethanes of similar hard segment content; improved phase separation and short contour lengths of the PIB chains were cited as possible causes of this behaviour. Stress-strain data indicated a change from isolated to interconnected domain morphology with increasing hard segment content. Preliminary environmental tests indicated that polyisobutylene based materials exhibit improved hydrolytic stability and reduced moisture permeability compared to polyether and polyester polyurethanes and greater oxidative stability compared to polybutadiene based materials. (52 refs.)

101602 Relation of low-frequency skeleton vibrations in glassy polymers with equilibrium rigidity of macromolecules. V.A.Bershtein, V.A.Ryzhov, S.I.Ganicheva, L.I.Ginzburg.
Vysokomol. Soedin. Ser. A (USSR), vol.25, no.7, p.1385-90 (July 1983). In Russian. English translation in: *Polym. Sci. USSR (GB)*
The influence of chemical crosslinks of chains on the far-infrared spectra has been studied for copolymers of styrene with divinylbenzene and methyl methacrylate with dimethacrylate ethylene glycol for a wide range of the concentration of the second comonomer (concentration of crosslinks). In crosslinked polymers the decrease of intensity of low-frequency vibrational motions of chains is observed. The character of the change of 225 and 245 cm^{-1} absorption bands related to skeleton vibrations points out their immediate relation with the equilibrium rigidity of macromolecules. The Kuhn segment corresponds to the characteristic motion unity. (27 refs.)

61.50 CRYSTALLINE STATE

(inc. molecular motions in solids; for magnetic structure and spin systems, see 75.25)

101603 A molecular dynamics calculation of the plastic phase of NaCN. M.Yvinec, R.M.Pick (Dept. de Recherches Phys., Univ. Pierre et Marie Curie, Paris, France).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.575-81 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
A large number of molecular crystals are actually known to present a high temperature disordered phase named 'plastic' which is an intermediate phase between the solid and the liquid states. In this plastic phase, the molecular centers of mass still form a regular lattice while the molecular orientations display some degree of disorder. The authors present a computer simulation which was primarily intended to provide a description of plastic molecular crystals. They have used the molecular dynamics technique for a two dimensional model which is an idealization of the sodium cyanide (NaCN). (7 refs.)

101604 Molecular dynamics on a parallel computer. G.S.Pawley, M.T.Dove (Dept. of Phys., Univ. of Edinburgh, Edinburgh, Scotland).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.583-92 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
For many years the computing capacity available to research science has grown at a rate of about ten times every five years. The major gain in capacity from now on will come from the use of parallel processors. Such computers are already proving ideal for certain molecular dynamics (and Monte Carlo) problems where the architecture of the computer is especially favourable. The architecture of the DAP is discussed, and it is shown that this favours lattice simulations rather than liquid simulations. Recent progress on the analysis of the dynamics of the plastic phase of SF_6 is reported, followed by results from a simulation of crystalline naphthalene, in which anharmonic properties have been analysed. (16 refs.)

101605 Neutron scattering study of the reorientational motions for NH_3 groups in $(NH_3(CH_2)_3NH_3)MnCl_4$. C.Sourisseau (Lab. de Spectrochimie Infrarouge et Raman, Thiais, France), G.Lucazeau, A.J.Dianoux.
J. Phys. (France), vol.44, no.8, p.967-74 (Aug. 1983).
Incoherent quasi-elastic neutron scattering experiments have been performed on oriented crystals, and on polycrystalline samples of $(NH_3(CH_2)_3NH_3)MnCl_4$ and $(NH_3(CD_2)_3NH_3)MnCl_4$ compounds in the 4-300K temperature range. Backscattering and time of light spectrometers were used; spectra were obtained using different resolutions (1-170 μeV) and a large range of momentum transfers (0.17-2.57 $Å^{-1}$). It is concluded that NH_3 groups reorientate below 300K; the experimental spectra have been satisfactorily fitted with a model of 2 $\pi/3$ jumps of the NH_3 groups, associated with a correlation time of 1×10^{-11} s at 300K and an activation energy roughly equal to 27 kJ/mol. Finally a comparison with literature data, mainly from NMR and Raman results, is presented. (19 refs.)

101606 Calculation of the molecular rotational potential from Bragg scattering data: the method and an application to $(NH_4)_2SnCl_6$. K.Vogt, W.Prandl (Inst. fur Kristallographie, Univ. Tubingen, Tubingen, Germany).
J. Phys. C (GB), vol.16, no.24, p.4753-68 (30 Aug. 1983).
The distribution of orientationally disordered rigid molecules is governed by the rotational potential. The authors present a procedure by which they derive the rotational potential from Bragg scattering. The analysis is applied to neutron diffraction data from $(NH_4)_2SnCl_6$ taken at $T=293$ and 140K, respectively. The new method gives a better fit to the data than the conventional crystal structure analysis. The computed rotational potential is temperature-independent at least between room temperature and 140K, and the rotational barriers are consistent with the observed activation energy. (29 refs.)

61.50C Physics of crystal growth

(for techniques of crystal growth and film deposition, see 81.10 and 81.15; for epitaxy, thin films, see 68.55; for whiskers, see 68.70)

101607 Evidence for the growth mechanism of Cr_2O_3 at low oxygen potentials. H.Hindam (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA), D.P.Whittle.
J. Electrochem. Soc. (USA), vol.130, no.7, p.1519-23 (July 1983).
The growth rate of Cr_2O_3 on pure Cr, Ni-25, and 50% Cr and Co-25% Cr in flowing CO-CO_2 mixtures of effective oxygen pressures in the range 8.4×10^{-15}-8.3×10^{-9} atm at 1000°C has been measured. The parabolic growth constant is virtually independent of oxygen potential for both pure Cr and the alloys; for the alloys, it is about an order of magnitude smaller than for pure Cr. These results provide supportive evidence for Cr interstitials being the predominating mobile defect species in Cr_2O_3 under these conditions. (18 refs.)

101608 Application of the Wanklyn model to the BaO-BaF_2-B_2O_3-Y_2O_3-Fe_2O_3 flux system. P.Paroli (Istituto di Elettronica dello Stato Solido, CNR, Roma, Italy).
Mater. Res. Bull. (USA), vol.18, no.7, p.835-40 (July 1983).
Data on the BaO-$BaF_2B_2O_3$-Y_2O_3-Fe_2O_3 flux system are analyzed in terms of the model recently proposed by Wanklyn, Verified thus far for lead- and alkali-based fluxes. The model is found to hold, with the noticeable exception that in this particular case the basic oxide and the corresponding fluoride are not equivalent from the standpoint of phase equilibria: on the contrary, a BaF_2 addition makes 'ineffective' a small but definite fraction of the BaO present in the melt. (3 refs.)

101609 Simulation studies of the hydrodynamics in high-temperature solutions for crystal growth. III. Flow rates in the presence of free and forced convections proceeding in opposite directions. V.Nikolov, K.Iliev, P.Peshev (Inst. of General & Inorganic Chem., Bulgarian Acad. of Sciences, Sofia, Bulgaria).
Mater. Res. Bull. (USA), vol.18, no.7, p.889-96 (July 1983).
For pt.II see ibid., vol.18, p.9 (1983). An experimental simulation study has been carried out on the convection flow rate under the crystal during its growth from a high-temperature solution by the TSSG method or from a melt by the Czochralski method when periphery heating of the crucible is prevailing and simultaneous free and forced convections with opposite directions are present. It has been established that with increasing proportion of forced convection the resultant flow direction changes from downwards to upward. Immediately before the diection change, the flow is unstable with respect to time. The direction change has been found to occur at a definite ratio of the determination of the flow rate in the upflow region has been obtained. (10 refs.)

101610 On a particular type of twinning in the growth of rhenium single crystals. V.M.Romashov.
Russ. Metall. (GB), no.4, p.79-81 (1981). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.4, p.91-4 (1981). [received: June 1983]
By means of an X-ray technique, twinning of a particular type was detected in the initial zone of imperfect single crystals produced by electron-beam melting; the twinning plane (1012) coincides with the plane of the type (2130) of the second part of the twin. (3 refs.)

101611 Survey of the thermodynamics and kinetics of crystallization of Si and Ge. D.Turnbull (Div. of Appl. Sci., Harvard Univ., Cambridge, MA, USA).
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.131-4
The thermodynamic interrelations of the crystalline (c-sc), amorphous semiconducting (a-sc) and liquid metal (*l*m) states of Si and Ge, based on the existing thermal data, are reviewed. Then the kinetics of the interfacial processes in the growth of c-sc and a-sc into undercooled *l*m and the conditions for transition from c-sc to a-sc growth are discussed. (15 refs.)

61.50E Crystal symmetry; models and space groups, and crystalline systems and classes

101612 The invertibility of matter tensors. R.R.Birss (Dept. of Pure & Appl. Phys., Univ. of Salford, Salford, England).
J. Phys. C (GB), vol.16, no.24, p.L901-2 (30 Aug. 1983).
The conditions under which a matter, or property, tensor has an inverse are examined. It is shown that an inverse does not exist when the matter tensor connects two physical tensors with different numbers of independent components. When these numbers are the same, a sufficient condition for invertibility is identified in terms of positive definitiveness. (3 refs.)

101613 Simple criteria for the existence of Cochran cyclotomic sets. V.G.Rau, L.G.Parkhomov, V.V.Ilyukhin, N.V.Belov (P.I. Lebedev-Polyanskii State Pedogogical Inst., Vladimir, USSR).
Sov. Phys.-Dokl. (USA), vol.27, no.11, p.897-8 (Nov. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.1-3, p.91-4 (Nov. 1982).
In two earlier papers (1982) the authors have shown that a necessary condition for the existence of Cochran cyclotomic sets of period $v=nd$ is that of solvability of $d+1$ equations in nonnegative integers $g_i \epsilon \{0,1\}$. Now they propose some simpler criteria, which it proved possible to derive only with the proof of some general theorems associated with the concept of a weighting cyclotomic set. (5 refs.)

101614 Additional symmetry with superposition of regular systems of points. E.A.Soldatov, E.A.Kuz'min, K.N.Akatova, V.V.Ilyukhin, N.V.Belov (Physicotech. Res. Inst., N.I. Lobachevski State Univ., Gorki, USSR).
Sov. Phys.-Dokl. (USA), vol.27, no.11, p.899-900 (Nov. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.1-3, p.95-6 (Nov. 1982).
Investigations of pseudosymmetry are, as a rule, confined to the study of the pseudosymmetry of the individual regular systems. On the basis of the vector system of segments it becomes possible to investigate this complication within the more general framework of the pseudosymmetry of a superposition of regular systems. Using this concept, the authors assume that pseudosymmetry arises when two regular systems of one group become one regular system of another group. In terms of rhombi, this means that peaks of the interaction of the first group become peaks of the bundle of the second, which are found in certain Harker sections. This means that the regular systems are oriented in a particular way among themselves, so that the basis section is in a particular position. For example, for a pseudoplane the corresponding vector has two fixed coordinates, while for a pseudoaxis it has one. (4 refs.)

101615 Three types of one-dimensional disordering of close-packed martensite structures. E.A.Pilyankevich, A.I.Ustinov, K.V.Chuistov (Inst. of Metal Phys., Acad. of Sci., Kiev, Ukrainian SSR).
Sov. Phys.-Dokl. (USA), vol.27, no.11, p.981-3 (Nov. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.1-3, p.634-7 (Nov. 1982).
Determines the quantitative structural prerequisites for the qualitatively different diffraction patterns of one-dimensionally disordered crystals. On the basis of what was found, the one-dimensionally disordered crystals were classified into three groups, according to the similarity in the type of predominant stacking shift and according to the form of the diffraction pattern in the group. (8 refs.)

61.50K Crystallographic aspects of polymorphic and order-disorder transformations

101616 Polymorphism and superconductivity of $LaIr_2Si_2$. H.F.Braun (Dept. de Phys. de la Matiere Condensee, Univ. de Geneve, Geneve, Switzerland), N.Engel, E.Parthe.
Phys. Rev. B (USA), vol.28, no.3, p.1389-95 (1 Aug. 1983).
$LaIr_2Si_2$ has a high-temperature form crystallizing in the primitive tetragonal $CaBe_2Ge_2$-type structure (space group $P4/nmm$; $a=4.191$ Å, $c=9.944$ Å), and a low-temperature form of the body-centered tetragonal $ThCr_2Si_2$ type (space group $I4/mmm$; $a=4.109$ Å, $c=10.299$ Å). Both structures are $BaAl_4$-type derivatives. The high-temperature modification may be quenched from above the transformation temperature of 1720°C and becomes superconducting at 1.6K, while the low-temperature modification is normal down to 1K. The structures of both modifications have been refined in single-crystal studies. The exceptional polymorphism of $LaIr_2Si_2$ is discussed, emphasizing structural relationships and the occurrence of superconductivity in the high-temperature modification. (18 refs.)

61.50L Crystal binding

101617 The effect of molecular excitation on crystal packing. 9-cyano-and 9,10-dimethylanthracene as excited guest/host and host/guest pairs. K.Norris, P.Gray, D.P.Craig, C.P.Mallett, B.R.Markey (Res. School of Chem., Australian Nat. Univ., Canberra, Australia).
Chem. Phys. (Netherlands), vol.79, no.1, p.9-19 (15 Aug. 1983).
The crystal packing of an electronically excited 9-cyanoanthracene (9-CNA) in host 9,10-dimethylanthracene (DMA), and the packing with roles of host and guest exchanged, are calculated using standard atom-atom potentials and a range of estimates of the changes in intermolecular forces in the molecular excited states. Exciplex formation is discussed in the two cases. Excited 9-CNA in DMA is stable to unsymmetrical displacement both in the unrelaxed and relaxed lattices. Excited DMA is unstable in a rigid 9-CNA lattice, being asymmetrically displaced towards one neighbour in the molecule stack; however, since the excitation of DMA is at higher energy than that of 9-CNA, the physically more realistic case is that of an excited 9-CNA molecule adjacent to the guest. Calculation shows that the excited molecule, in a rigid lattice, is unstable at its ground-state site, and that it will move to one of two potential minima closer to either the neighbour DMA or to the other neighbour (9-CNA). However, the simulation of long-time behaviour through calculation of changes in local molecular packing suggests no such instability. (26 refs.)

101618 Correlation of electron binding energy with the chemical shifts. K.S.Srivastava, A.Chaube, K.Sinha, A.Tandon, M.Husain (Phys. Dept., Lucknow Univ., Lucknow, India).
Indian J. Phys. Part B, vol.57B, no.1, p.71-5 (Feb. 1983).
Numerical order of the chemical shift of the X-ray absorption edges has been calculated by valence shell potential model (VSPM). A new expression for the charge parameters has been given. The calculated values of the chemical shifts correspond well with the experimentally observed values of the other workers. (16 refs.)

101619 Effects of a partial relaxation of the crystal lattice on the calculation of the electronic structure of CrF_6^{3-} in 'isolated-cluster' and 'shared-cluster' crystals. Z.Barandiaran, L.Pueyo (Dept. de Quimica-Fisica, Univ. de Oviedo, Oviedo, Spain).
J. Chem. Phys. (USA), vol.79, no.4, p.1926-32 (15 Aug. 1983).
The electronic structure of the CrF_6^{3-} in isolated-cluster crystals (K_2NaCrF_6, Rb_2NaCrF_6, Rb_2KCrF_6, and Cs_2KCrF_6) and in the shared-cluster system CrF_3 has been calculated in terms of an open-shell Hartree-Fock-Roothaan SCF methodology which includes the corresponding cluster-lattice interactions. These interactions have been calculated with different models of the crystal lattice. First, a rigid point-charge model has been used to compute the lattice potential. Then, this lattice representation has been partially relaxed in the sense that either the values of the point charges q(Cr), q(F) or the Cr-F internuclear distance or both are allowed to change in order to be consistent with the predictions of the cluster calculation. In CrF_3 the relaxation has been limited to the values of the point charges. In the isolated-cluster lattices it is extended to include the lattice value of the Cr-F distance. The results of these calculations have been analyzed with particular attention to the prediction of the equilibrium geometry and the electronic transition 10 Dq. The effect of the partial lattice relaxation on these two observables turns out to be rather significative in CrF_3 but uniformly small in the isolated-cluster lattices. The values of R_e and 10 Dq obtained in the best calculation on CrF_3 are in very good agreement with the experimental observations. (12 refs.)

101620 Madelung constants for layer compounds. T.H.Shen, W.Y.Liang (Cavendish Lab., Univ. Cambridge, Cambridge, England).
J. Phys. C (GB), vol.16, no.24, p.L883-8 (30 Aug. 1983).
Madelung constants have been calculated for layer compounds having octahedral and trigonal prismatic coordination structures, the value being 12.3 and 10.2 respectively. Applying the results to TaS_2, it was found that Ta ions carry a charge of about $1.2e$. (3 refs.)

101621 Universal features of bonding in metals. J.H.Rose (Ames Lab., Iowa State Univ., Ames, IA, USA), J.R.Smith, J.Ferrante.
Phys. Rev. B (USA), vol.28, no.4, p.1835-45 (15 Aug. 1983).
Binding-energy-distance relations for metallic systems are shown to exhibit a universal behavior under a simple two-parameter scaling. All currently available ab initio calculations for the cohesion and adhesion of metals, as well as the chemisorption of gas atoms on metal surfaces, are shown to be determined by this single relation. Further, the energetics of diatomic molecules are determined by the same relation, despite the existence of strong volume-dependent forces for metals. These findings suggest a commonality of metallic bonding and a close relationship between molecular and metallic bonding. The universal nature of binding-energy-distance relations implies relations between seemingly disparate physical phenomena. As an example the authors show that the surface-binding-energy relation can be approximately expressed in terms of the bulk quantities. This leads to an explanation of the well-known empirical result that the surface energy per surface atom is proportional to the cohesive energy per bulk atom. Also, a simple relationship between adsorbate-substrate vibrational stretch frequencies and their desorption energies follows from the universal relationship. (33 refs.)

101622 Parametrized density functionals in the phase theory in alloys of 3D-transition metals. V.Ja.Dvoretskiy, Yu.A.Khon (Inst. of Atmospheric Optics, Acad. of Sci., Tomsk, USSR).
Solid State Commun. (USA), vol.47, no.7, p.533-5 (Aug. 1983).
The calculation of the formation energies of a number of alloys of the 3d-transition metals as a function of concentration and long-range order parameter was made on the parametrized density functional formalism. The results obtained were in good agreement with experiment. It was shown that in the NiTi system a significant role is played by the ion component of binding energy, and in the FeCo system-by ferromagnetism. (14 refs.)

101623 Effective charges of the valence shells on atoms of A15 chemical compounds. B.N.Kodess, I.A.Massalimov (Inst. of Nuclear Phys., Moscow State Univ., Moscow, USSR).
Solid State Commun. (USA), vol.47, no.7, p.545-7 (Aug. 1983).
X-ray diffraction data are used to calculate the charges of the valence shells of Si and V in V_3Si. The subsequent integration of the deformation density (ρ def $(\vec{r})=\rho$ exp $(\vec{r})-\rho$ at $(\vec{r})$) indicates that the charges on Si atoms decrease and on V atoms increase in comparison with the charges on free atoms. The magnitude of charge transfer is compared to the results of self-consistent band structure calculation. The observed increase of charge for atom V may be associated with the compression of the 3d-shells of V in V_3Si. (10 refs.)

101624 Electronic energy and short-range order in binary alloys. M.O.Robbins, L.M.Falicov (Dept. of Phys., Univ. of California, Berkeley, CA, USA).
Alloy Phase Diagrams. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.63-6
An electronic theory for the total energy of binary alloys is presented. It treats the entire range of concentration and short-range order. The method is not ab initio, but requires only information about the pure elemental constituents of the alloy. Results for two very different metal series, monovalent metals and 4-d transition metals, are calculated and compared to experiment and other models. The model calculation allows us to examine the physical basis for experimental trends. (32 refs.)

101625 Lattice energy functions for predictions of structural properties of alloy phases. E.S.Machlin (Henry Krumb School of Mines, Columbia Univ., New York, NY, USA).
Alloy Phase Diagrams. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.67-80
Lattice energy functions have been used to predict various properties. The energies and volumes of formation of alloy phases, as well as the relative stabilities of competing phases are provided by a model based on Mie-type interatomic potentials. The elastic constants of alloy phases are treated using a model sensitive to the quadrupole distortion of a repulsion spheroid. The properties of defects are treated using a model based on both a volume dependent contribution and an interatomic potential contribution to the lattice energy. Good predictability is obtained for all three types of lattice energy functions in their respective applications. (37 refs.)

101626 The atom as the building block in crystal: the use of electron charge-density data base for calculating structural properties of metals. G.L.Krasko (Dept. of Materials Sci. & Engng., MIT, Cambridge, MA, USA).
Alloy Phase Diagrams. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.93-8
A new method of calculating structural properties of metals is suggested. The method utilizes the data of 'first principle' charge-density distributions in pure metals accumulated in recent years. If, for a metal, the solution to the Schrodinger equation within the automatic cell is known, the electron charge-density distribution in an arbitrary point of the crystal may be 'reconstructed' within the framework of a model. Using the density-functional formalism and the virial theorem, the total energy of the crystal may be found in terms of an effective interatomic potential. The latter may be used for the calculating of other structural properties, such as phonon spectra and elastic moduli. The extension of this method to alloys is briefly discussed. (12 refs.)

101627 Evaluation and meaning of ionic and dipolar lattice sums. E.R.Smith (Dept. of Math., Univ. of Melbourne, Parkville, Victoria, Australia), J.W.Perram.
Physics of Superionic Conductors and Electrode Materials. Proceedings of a NATO Advanced Study Institute on the Physics of Superionics Conductors and Electrode Materials, Odense, Denmark, 4-22 Aug. 1980 (New York, USA: Plenum Press 1983), p.41-55
The authors discuss the lattice sums which arise in simulations of ionic and dipolar systems using periodic boundary conditions. The lattice sums are conditionally but not absolutely convergent and so the order of summation must be given. They sum them by spherical shells and discuss the role of an 'external dielectric constant' ϵ', when the dielectric constant of a continuum outside the outermost shell becomes large. The lattice sums are converted into absolutely and rapidly convergent lattice sums and methods for rapid evaluation of these sums are discussed. The effect of ϵ' on the Hamiltonian is discussed. The effect of changes in ϵ' on the mean square dipole moment fluctuations is discussed and illustrated by reference to some Monte Carlo simulations of restricted primitive electrolyte. (20 refs.)

101628 Evaluation of lattice sums in disordered ionic systems. E.R.Smith (Dept. of Math., Univ. of Melbourne, Parkville, Victoria, Australia), J.W.Perram.
Physics of Superionic Conductors and Electrode Materials. Proceedings of a NATO Advanced Study Institute on the Physics of Superionics Conductors and Electrode Materials, Odense, Denmark, 4-22 Aug. 1980 (New York, USA: Plenum Press 1983), p.57-78
The potential energy of a crystal of point ions in an external field or the field set up by an impurity is written down and from it a set of equations for the distortion of the lattice caused by the field are derived. Since the distortions may often be small, it is clear that solutions of the linearised equations will be very useful. The linearised equations may be studied by Fourier transform techniques. These techniques require that lattice sums for ion-ion and ion-defect potentials be analysed with some care. The relevant sums are analysed, in a form which allows their use in some lattice distortion problems. (5 refs.)

101629 Some applications of conditionally convergent lattice sums. E.R.Smith (Dept. of Math., Univ. of Melbourne, Parkville, Victoria, Australia), J.W.Perram.
Physics of Superionic Conductors and Electrode Materials. Proceedings of a NATO Advanced Study Institute on the Physics of Superionics Conductors and Electrode Materials, Odense, Denmark, 4-22 Aug. 1980 (New York, USA: Plenum Press 1983), p.143-62
The authors use lattice sums to study two systems. The first is the simple cubic lattice, with unit lattice spacing with a polarisable point of polarisability α at each lattice site. For this system they consider first a plane slab of the material in an external electric field. The response of the system to a small external field gives the dielectric constant of the system. They also calculate the response of the polarisable points close to the surface of the plane slab. Next they consider the response of a large sphere of the material to a charge or fixed dipole at the centre of the sphere and find an asymptotic expression for the polarisation of points far from the 'defect'. These expansions also allow calculation of the dielectric constant. The second system studied is a plane slab of ionic crystal responding to an applied electric field. The authors show how to calculate the distortion of the crystal produced by the field and thus obtain the dielectric constant of the crystal. Results for the dielectric constant for a CsCl structure are given and show how the dielectric constant depends on the repulsive potential between the ions. (4 refs.)

101630 Boundary conditions in the simulation of ionic systems. S.W.de Leeuw (Theoretical Phys., Univ. of Oxford, Oxford, England).
Physics of Superionic Conductors and Electrode Materials. Proceedings of a NATO Advanced Study Institute on the Physics of Superionics Conductors and Electrode Materials, Odense, Denmark, 4-22 Aug. 1980 (New York, USA: Plenum Press 1983), p.163-76
The Hamiltonian of a periodic array of charges contains terms depending on the shape and the surroundings of the system. The effect of these terms on the properties of the system is considered and some relations are derived for the long wavelength behaviour of fluctuations in the system. A brief discussion of the dynamical properties of the system under different boundary conditions is given. (14 refs.)

101631 Introduction to Monte Carlo simulation techniques. D.Adams (Dept. of Chem., Univ. of Southampton, Southampton, England).
Physics of Superionic Conductors and Electrode Materials. Proceedings of a NATO Advanced Study Institute on the Physics of Superionics Conductors and Electrode Materials, Odense, Denmark, 4-22 Aug. 1980 (New York, USA: Plenum Press 1983), p.177-95
Starting from the assumption that matter consists of interfacing particles obeying classical mechanics, and using the postulates of statistical mechanics, one can model any specific material as a system of particles provided one knows what the interactions between the particles are. However, whatever interactions are chosen the integrals that it is necessary to solve are formidable. The authors present a standard numerical technique for solving multidimensional integrals when ordinary quadrature is impractical. Instead of trying to obtain values of the integrand at every point on a regular grid they find a very much smaller number of values scattered through the multidimensional volume of integration. This does not give a very accurate value of the integral, but provided that the sample points have been chosen without bias the answer obtained will also be unbiased. By taking more and more samples of the integrand the accuracy can be made as high as required. The simplest way of sampling to do this is to sample at randomly chosen points. This is Monte Carlo integration, the use of random numbers, of chance, to obtain a definite, correct (but necessarily approximate) value of an integral. (37 refs.)

101632 Molecular dynamics with constraints. H.J.C.Berendsen, W.F.van Gunsteren (Lab. of Physical Chem., Univ. of Groningen, Groningen, Netherlands).
Physics of Superionic Conductors and Electrode Materials. Proceedings of a NATO Advanced Study Institute on the Physics of Superionics Conductors and Electrode Materials, Odense, Denmark, 4-22 Aug. 1980 (New York, USA: Plenum Press 1983), p.221-40
A method is described to include constraints such as bond lengths and bond angles into molecular dynamics simulations, while retaining cartesian coordinates. The effects of constraints on physical behaviour and computational efficiency are evaluated. A Fortran subroutine (SHAKE) is appended. (18 refs.)

61.55 SPECIFIC STRUCTURE OF ELEMENTS AND ALLOYS

61.55F Metallic elements

101633 Structural and electronic properties of small metal aggregates. J.Buttet, J.P.Borel (Inst. de Phys. Experimentale, Ecole Polytech. Federale de Lausanne, Lausanne, Switzerland).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.541-50 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
The authors review the information obtained by electron microscopy and electron diffraction techniques on the structure of aggregates of diameter larger than $\sim$20 Å, and describe the results of simple models. They focus on very small alkali metal aggregates and compare some of the available experimental data with calculations of their structural and electronic properties. The evolution of the properties of alkali metal clusters as a function of size is certainly not representative of all metal aggregates. (49 refs.)

61.55H Alloys

101634 Temperature dependence of the short range order parameters in Cu-15 at.% Al alloy. V.S.Zubchenko, M.P.Kulish, P.V.Petrenko, O.O.Tatarov.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.6, p.75-7 (1983). In Ukrainian.
A short-range ordering of the Cu-15 at.% alloy is studied within a wide temperature range (20-600°C) by the method of high-temperature X-ray diffraction. An increase in the short-range order degree with temperature is found. This is explained by existence of two ordering types in the alloy which are stable within different temperature ranges. (14 refs.)

101635 Effects of high dynamic pressures on the structure and mechanical properties of martensitic steels 38KhS and 30KhGSN2A. A.P.Bashchenko, A.O.Mettus, M.N.Spasskii, L.P.Orlenko (Inst. of Metallography & Phys. of Metals, Moscow, USSR).
Fiz. Met. & Metalloved. (USSR), vol.55, no.6, p.1202-6 (June 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
A study was made of the various ways of applying high dynamic pressures (initiated by explosions) on the structure and mechanical properties of high-strength construction steels with the martensitic structure. Electron and optical microscopes were used to reveal a number of structural features of the martensite after the action of high dynamic pressures. The subsequent plastic

deformation of steels treated in this way was more homogeneous in the interior. It was found that the application of high dynamic pressures could result in a further increase in the hardness without deterioration in the plasticity and impact toughness. (6 refs.) *A.T.*

101636 Crystalline and magnetic structures in $REAl_xGa_{2-x}$ systems (RE=Nd, Er; $0 \leq x \leq 2$). I. Crystalline structures. O.E.Martin, K.Girgis (Inst. fur Kristallographie und Petrographie, Eidgenossische Tech. Hochschule, Zurich, Switzerland).
J. Magn. & Magn. Mater. (Netherlands), vol.37, no.3, p.228-30 (July 1983).
Part I describes results of crystalline structures found for the $NdAl_xGa_{2-x}$ and $ErAl_xGa_{2-x}$ pseudoternary solid solution systems ($0 \leq x \leq 2$). Characterization techniques include X-ray diffraction, electron microprobe analysis and DTA measurements. (6 refs.)

101637 Temperature dependence of lattice parameters and FCC/FCT/FCO transformations in some Mn-base metastable γ-phase alloys. K.Ito, M.Tsukishima, M.Kobayashi (Dept. of Materials Sci., Univ. of Tokyo, Tokyo, Japan).
Trans. Jpn. Inst. Met. (Japan), vol.24, no.7, p.487-90 (July 1983).
Lattice parameters of quenched $Mn_{1-x}Fe_x$ (X=0.27-0.31), $(Mn_{1-x}Fe_x)_{0.95}Cu_{0.05}$ (X=0.15-0.28), and $(Mn_{1-x}Co_x)_{0.95}Cu_{0.05}$ (X=0.05-0.19) alloys were measured at temperatures between 80 and 480K. The Mn-Fe and Mn-Fe-Cu alloys transformed from fcc to fct(c/a<1) structure on cooling below a critical temperature which was equal to or lower than the Neel temperature. With increasing cobalt concentration, the Mn-Co-Cu alloys underwent on cooling fcc/fct(c/a<1), fcc/fct(c/a<1)/fco, fcc/fct(c/a>1)/fco, and fcc/fct(c/a>1) transformations. These lattice change behaviours were compared with those of In-base alloys. (18 refs.)

61.60 SPECIFIC STRUCTURE OF INORGANIC COMPOUNDS

101638 Synthesis and study of the trivalent thallium chromate $Tl_2(CrO_4)_3$ and double chromates of formula type $M^IM^{III}(CrO_4)_2$, nH_2O ($M^I=Tl^+$, Ag^+; $M^{III}=Tl^+$, Bi^{3+}; n=0.1). A.Lecerf, Y.Cudennec, A.Riou, Y.Gerault (INSA, Rennes, France).
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.14, p.1047-50 (18 April 1983). In French.
The trivalent thallium chromate $Tl_2(CrO_4)_3$ double chromates $AgTl(CrO_4)_2$, $AgTl(CrO_4)_2$, $1H_2O$ and $TlBi(CrO_4)_2$ α, β, γ, δ have been prepared. The crystal parameters of several phases have been determined with a single crystal. $Tl_2(CrO_4)_3$, $AgTl(CrO_4)_2$, $1H_2O$ and $TlBi(CrO_4)_2\alpha$ have an orthorhombic unit cell. $TlBi(CrO_4)_2$ γ and $TlBi(CrO_4)_2$ δ unit cell is monoclinic. (8 refs.)

101639 Crystallographic study of mixed oxides Sr_2MWO_6. G.Bouvier, P.Poix (Ecole Nat. Superieure de Chem., Strasbourg, France).
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.15, p.1165-7 (25 April 1983). In French.
The crystallographic study of compounds Sr_2 MWO_6 (M=Mg, Ni, Co) establishes the cation distribution in the network and specifies for each compound the transition temperature quadratic+cubic. (4 refs.)

101640 Preparation and crystallographic characterization of two new hydrated trimetaphosphates: $Ca_3(P_3O_9)_2.10H_2O$ and $Cd_3(P_3O_9)_2.10H_2O$. N.El-Horr (CNRS, Beyrouth, Lebanon), A.Durif.
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.15, p.1185-7 (25 April 1983). In French.
$Ca_3(P_3O_9)_2.10H_2O$ and $Mn_3(P_3O_9)_2.10H_2O$ are monoclinic $P2_1/n$, Z=2 with the following unit cell dimensions a=9.332 (7), b=18.13 (1), c=7.841 (5) Å, β=106.69 (5)° for the calcium salt; a=9.219 (4), b=17.733 (8), c=7.644 (3) Å, β=107.37 (2)° for the manganese salt. Chemical preparations and the main crystallographic features are described for these two salts both isotypic with the corresponding cadmium salt: $Cd_3(P_3O_9)_2.10H_2O$. (7 refs.)

101641 Study by transmission electron microscopy of oxidation of zinc substituted magnetite in defective spinels. B.Gillot, R.Mohamed Benloucif, J.-C.Mutin, A.Rousset (Lab. sur la Reactivite de Solides, Faculte des Sci. Mirande, Dijon, France).
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.19, p.1505-8 (30 May 1983). In French.
Defective phases γ derived from the cubic γ Fe_2O_3 phase through the simultaneous substitution of Fe^{3+} ions and vacancies by Zn^{2+} ions following the scheme: $2Fe^{3+}+\square \rightarrow 3Zn^{2+}$ have been investigated by transmission electron microscopy. These defective phases γ possess an ordered arrangement of cation vacancies with a period of 1/3 unit vector along [100] and [010] directions for the total composition $\gamma-({Zn_{0.18}}^{2+}{Fe_{2.54}}^{3+}\square_{0.28}){O_4}^{2-}$. (12 refs.)

101642 Structure of bis(*p*-bromophenyl)tellurium(IV)dichloride. R.K.Chadha, J.E.Drake, J.L.Hencher (Dept. of Chem., Univ. of Windsor, Windsor, Ontario, Canada).
Can. J. Chem. (Canada), vol.61, no.6, p.1222-5 (June 1983).
The X-ray crystal structure of bis(*p*-bromophenyl)tellurium(VI) dichloride has been determined: R=0.25. The crystals were triclinic, P1, a=8.000(7) Å, b=11.811(11) Å, c=7.978(6) Å, α=101.85(7)°, β=98.73(6)°, γ=80.95(7)°, and Z=2. The compound exhibits a γ-trigonal bipyramidal arrangement of ligands around tellurium with weak secondary interactions between tellurium and bromine atoms in adjacent molecules. (13 refs.)

101643 Observations on the structure, stability and transformations of the graphite: $SbCl_5$ intercalate. J.M.Thomas, R.Schlogl, W.Jones, P.Korgul (Dept. of Phys. Chem., Univ. of Cambridge, Cambridge, England).
Carbon (GB), vol.21, no.4, p.409-14 (1983).
Notwithstanding its stoichiometry, $C_{32}SbCl_{4.7}$, the richest intercalate of graphite: $SbCl_5$ that the authors have prepared, is a dilute first stage compound, in which each interlamellar space, though occupied, is undersaturated. A variety of anionic species reside in this space, including ${SbCl_6}^-$, ${SbCl_5}^{2-}$, $SbCl_3$ and some anions where there are bridging chlorine atoms. The guest species together form interpenetrating two-dimensional superlattices (±16.1° $\sqrt{39}.\sqrt{39}$ and ±19.1 $\sqrt{7}\sqrt{7}$), the identities of which were established by variable-temperature selected area electron diffraction. This technique also confirmed the presence of a rather unusual phase transition that takes place at *caa.* 210K. Electron-stimulated energy dispersive analytical studies of the changes that occur when the freshly prepared intercalate is exposed to air imply that de-intercalation is rapid and that the subsequent hydrolysis of released antimony halide is rate-determining. (18 refs.)

101644 Crystallographic polarity and etching of cadmium telluride. P.F.Fewster, P.A.C.Whiffin (Philips Res. Labs., Redhill, England).
J. Appl. Phys. (USA), vol.54, no.8, p.4668-70 (Aug. 1983).
This paper resolves the inconsistency in the literature on the determination of the polarity of CdTe and $Cd_xHg_{1-x}Te$ from their etching behavior. The etch (H_2O:H_2O_2:HF, 2:2:3 v/v) has been shown to reveal pits on the Cd (111) *A* face and not on the Te $(\bar{1}\bar{1}\bar{1})$ *B* face in contradiction to the previously published work of Warekois, Lavine, Mariano, and Gatos [J. Appl. Phys. 33, 690 (1962)] and Nakagawa, Maeda, and Takeuchi [Appl. Phys. Lett. 34, 574 (1979)]. This result agrees with the observations of Fewster, Cole, Willoughby, and Brown [J. Appl. Phys. 52, 4568 (1981)] for $Cd_xHg_{1-x}Te$ grown epitaxially on CdTe. (5 refs.)

101645 Structure and intermolecular excitations of β-N_2 at 400 MPa and 55K. B.M.Powell, G.Dolling, H.F.Nieman (Chalk River Nuclear Labs., Atomic Energy of Canada Ltd., Chalk River, Ontario, Canada).
J. Chem. Phys. (USA), vol.79, no.2, p.982-91 (15 July 1983).
Elastic and inelastic neutron scattering measurements have been made on a single crystal of β-N_2 at 55K and a pressure of 400 MPa. The integrated intensities of 34 Bragg reflections were measured and analysed in terms of symmetry-adapted harmonics. None of the coefficients of the higher-order harmonics could be determined and, within experimental error, the N_2 molecule is randomly oriented. No well-defined librational modes were observed and even translational acoustic phonons are broad. The line shapes of translational acoustic phonons propagating along the hexagonal axis are analysed in terms of both Gaussian and Lorentzian line shapes and in terms of the Michel-Naudts theory of rotation-translational interactions (1978). In terms of the latter theory, β-N_2 is in the slow relaxation regime and has a strong rotation-translation interaction. The temperature dependence observed for four of these line shapes suggests that the librational excitations are no longer overdamped at 46K. Values for three of the elastic constants were determined and are (in units of 10^9 N m^{-2}): $C_{11}=4.43\pm0.14$, $C_{33}=5.92\pm0.14$, and $C_{44}=0.61\pm0.02$. (25 refs.)

101646 A neutron powder diffraction study of α- and β-PbO_2 in the positive electrode material of lead-acid batteries. A.Santoro (NBS, Nat. Measurement Lab., Washington, DC, USA), P.D'Antonio, S.M.Caulder.
J. Electrochem. Soc. (USA), vol.130, no.7, p.1451-9 (July 1983).
A neutron powder diffraction study of α and β-PbO_2, both chemically prepared and electrochemically formed in cycled battery plates, was carried out to correlate the electrochemical activity of the lead-acid battery with the atomic arrangement of the electrode constituents. The results are consistent with the presence of hydrogen in the structure of β-PbO_2, but the departure of the occupancy factors from stoichiometric values are not large enough to unambiguously establish whether there are lead or oxygen deficiencies. If the Pb:O ratio corresponds to exact stoichiometry, any hydrogen which is present must be accompanied by a reduction of Pb^{+4}. There is a significant increase in the lattice parameter *a* of β-PbO_2 in cycled battery electrodes relative to the value found in chemically prepared β-PbO_2. No change in the *c* parameter, however, was detected. These dimensional changes are consistent with a configuration for hydrogen similar to that observed in the rutile-type structure of SnO_2, in which there are OH^- ions oriented perpendicular to the *c* axis. The profile parameters obtained in this analysis show that the crystallites of β-PbO_2 in the positive plate material of a battery cycled three times are smaller than those in the chemically prepared compound, while there are no significant differences between the latter and β-PbO_2 in the positive plate material of a battery cycled 36 times. The average structure of α-PbO_2 cannot be accurately determined by profile analysis, at the present time. The difficulties encountered in the refinement may be due to extensive defects, nonspherical crystallites of small size, and/or small departures of the structure from orthorhombic symmetry. (26 refs.)

101647 Characterization of the current-blackening phenomena in scandia stabilized zirconia using transmission electron microscopy. F.K.Moghadam, T.Yamashita, D.A.Stevenson (Dept. of Materials Sci. & Engng., Stanford Univ., Stanford, CA, USA).
J. Mater. Sci. (GB), vol.18, no.8, p.2255-9 (Aug. 1983).
The nature of blackening of 8 mol.% Sc_2O_3-ZrO_2, caused by imposing high current densities on this material at 800°C and P_0, $<10^{-7}$ atm, has been investigated by transmission electron microscopy. The material studied was in the form of hot pressed polycrystalline discs with equiaxed grains 2 to 4 μm in size with a cubic fluorite structure. The current-blackened samples contained numerous polycrystalline aggregates, with crystallites 10 to 20 nm in size, and they were usually found at the grain boundaries. The lattice parameter of the phase is virtually identical to that of the original cubic-fluorite matrix phase. The electron diffraction pattern showed, however, weak reflections forbidden by the FCC symmetry of the parent phase. These reflections can only be indexed as primitive cubic, and it is proposed that grain boundary phase consists partly of non-stoichiometric zirconium suboxides (ZrO_{2-x}). The analysis of energy dispersive X-ray spectrum and electron diffraction patterns of the polycrystalline phase shows no evidence of the presence of metallic zirconium, as has been postulated previously. (18 refs.)

101648 High resolution X-ray diffraction of fully and partially magnesium stabilized beta″-alumina ceramics. F.Harbach (Brown, Boveri and Cie AG, Heidelberg, Germany).
J. Mater. Sci. (GB), vol.18, no.8, p.2437-52 (Aug. 1983).
The dependence of the unit cell size of β″-Al_2O_3 on its sodium and magnesium content has been stated in the past in a contradictory manner. This situation is clarified on the basis of high resolution Guinier photographs of the X-ray diffraction of fully stabilized ternary β″-Al_2O_3 ceramics with compositions of $Na_{1+z}Mg_zAl_{11-z}O_{17}$. The lattice constant a_0 increases with increasing z over the range of 0.5 to 0.8. In contrast, the height H of the conduction slab decreases with increasing z. Both values level off at $z \geq 0.8$. This behaviour is discussed using simple models. The X-ray diffraction patterns of β″-Al_2O_3 ceramics can show considerable splittings of reflections with high Miller indices/for compositions which do not correspond to the above formula. These splittings can be attributed to the simultaneous presence of two different β″$-Al_2O_3$ component phases-a fully and a partially magnesium stabilized one. The excess sodium of the partially stabilized component phase is shown to be charge compensated by interstitial oxygen ions in the conduction slab. (27 refs.)

101649 $K_4Mo_8{}^{V}P_{12}O_{52}$, a tunnel structure characterized by an unusual valence of molybdenum. A.Leclaire, J.-C.Monier, B.Raveau (Lab. de Cristallographie, Phys. et Chimie du Solide, Univ. de Caen, Caen, France).
J. Solid State Chem. (USA), vol.48, no.2, p.147-53 (1 July 1983).
A new phosphate of molybdenum (V) $K_4Mo_8{}^{V}P_{12}O_{52}$ has been isolated and its structure solved from a single crystal X-ray diffraction study. It crystallizes in a monoclinic cell, space group $C2/c$, with the parameters $a=10.7433(16)$ Å, $b=14.0839(9)$ Å, $c=8.8519(7)$ Å, and $\beta=126.42(1)°$. After refinement of the different parameters, the reliability factors were lowered to $R=0.026$ and $R_w=0.029$. The framework '$Mo_8P_{12}O_{52}$' can be described as corner-shaping PO_4 tetrahedra, P_2O_7 groups, and MoO_6 octahedra. Although the 'O_6' octahedron surrounding the molybdenum ion is almost regular, the metal ion is strongly off center so that its coordination is better described as a MoO_5 pyramid. This particular coordination, which characterizes Mo(V), is discussed. (23 refs.)

101650 Investigation of the structural description of the endothermic decompositions of solid 1 to solid 2+gas. III. Case of reaction $BaC_2O_4,2H_2O$ to BaC_2O_4,H_2O+H_2O: comparison of crystal structures of the two hydrates and X-ray analysis of the pseudomorphs. M.Ben Amor, J.C.Mutin (Lab. de Recherches sur la Reactivite des Solides, Faculte des Sci. Mirande, Dijon, France), A.Aubry, A.Courtois.
J. Solid State Chem. (USA), vol.48, no.2, p.215-30 (1 July 1983).
For pt.II see ibid., vol.38, p.394 (1981). The topological analysis of the crystal structure of initial and final phases of the dehydration $BaC_2O_4,2H_2O \rightarrow BaC_2O_4,H_2O+H_2O$ shows that the structural transformation may proceed by small and cooperative movements in the dihydrate's ions. Only one type of such movements may be described by this approach. However, the X-ray analysis of BaC_2O_4, $2H_2O$ crystals partially transformed into BaC_2O_4, H_2O reveals several relationships of nonequivalent orientation between the crystal lattice of the two solid phases. The possible significance of the peculiarities of the reticular orientations is discussed. (16 refs.)

101651 Investigation of the structural description of the endothermic decompositions solid 1 to solid 2+gas. IV. Core of reaction $BaC_2O_4,2H_2O$ to BaC_2O_4,H_2O+H_2O characteristics of structural rearrangement. M.Ben Amor, J.C.Mutin (Lab. de Recherches sur la Reactivite des Solides, Faculte des Sci. Mirande, Dijon, France), A.Aubry, A.Courtois.
J. Solid State Chem. (USA), vol.48, no.2, p.231-41 (1 July 1983). In French.
For pt.III see ibid., vol.48, p.215 (1983). The X-ray analysis of $BaC_2O_4,2H_2O$ crystals partially transformed into BaC_2O_4,H_2O leads to the specific reticular orientation relationships of the dehydration $BaC_2O_4,2H_2O \rightarrow BaC_2O_4,H_2O+H_2O$. Their interpretation has been made by a plane-by-plane comparison of the dihydrate crystal structure with the monohydrate. The principal features of the ionic movements are described; they differ from those which are expected from a simple topological comparison of the structures. With the assumption of a displacive transformation, coherent or semicoherent interfaces seem to be built up from all invariant plane families, as deduced from the X-ray analysis. (8 refs.)

101652 Crystal chemistry of $Tl_6{}^{III}Te^{VI}O_{12}$ and $Tl_6{}^{I}Te^{VI}O_6E_6$: an example of original stoichiochemical activity of the electronic pair $6s^2(E)$ in thallium(I). B.Frit (Lab. de Chimie Minerale Structurale, UER des Sci., Limoges, France), G.Roult, J.Galy.
J. Solid State Chem. (USA), vol.48, no.2, p.246-55 (1 July 1983).
Both crystal structures of Tl_6TeO_{12} and $Tl_6TeO_6E_6$ compounds have been determined, the former by X-ray single crystal techniques, the latter by powder neutron diffraction techniques. They crystallize in the trigonal system, space group $R\bar{3}$, the corresponding hexagonal cell parameters are $a=9.645(2)$ Å, $c=9.421(2)$ Å, and $a=9.5722(3)$ Å, $c=9.3494(4)$ Å, respectively, with $Z=3$. In both compounds tellurium(VI) is octahedrally coordinated to oxygen atoms with Te-O distances of 1.936 Å for the Tl(III)-containing compound, i.e. Tl_6TeO_{12}, and 1.946 Å for Tl_6TeO_6 (Tl(I)). Tl(III) is surrounded by seven oxygen atoms sitting at the summits of a distorted monocapped trigonal prism. Tl(I) is linked to three oxygen atoms, forming a distorted TlO_3 pyramid. The lone pairs brought by Tl(I) are in the positions precedingly occupied by oxygen atoms in the crystal structure of Tl_6TeO_{12}. This is an outstanding example of the crystallochemical role of the lone pairs E which act like oxygen atoms, making $Tl_6{}^{I}Te^{VI}O_6E_6$ isostructural with $Tl^{III}Te^{VI}O_{12}$. Structural relationships with fluorite type network are discussed. (21 refs.)

101653 On chalcogenide-iodates of antimony SbXI (X=Si, Se, Te): structure and Mossbauer spectra of ^{121}Sb. A.Ibanez, J.-C.Jumas, J.Olivier-Fourcade, E.Philippot, M.Maurin (Lab. de Chimie Mineralke C, Univ. des Sci. et Tech. du Languedoc, Montpellier, France).
J. Solid State Chem. (USA), vol.48, no.2, p.272-83 (1 July 1983). In French.
The crystal structure of $SbXI$ (X=Se, Te) compounds has been determined by means of three-dimensional intensity data. The crystal structure of SbSeI, orthorhombic, space group Pnma with $a=8.698(2)$, $b=4.127(1)$, $c=10.412(2)$ Å, was refined at several temperatures (180K, $R=0.021$; 293K, $R=0.020$; 320K, $R=0.023$) in correlation with the paraelectric structure or SbSI stable above 293K. The crystal structure of SbTeI, triclinic, space group $P\bar{1}$, with $a=7.570(3)$, $b=7.159(3)$, $c=4.228(3)$ Å, $\alpha=107.22(5)$, $\beta=106.18(4)$, $\gamma=77.19(3)°$ has been determined by symbolic addition method and refined to a final R value of 0.035. These structures are built up from infinite weakly linked ribbons $(SbX_2)_n$ of trigonal SbX_3 with Sb-X bonds of 2.605(1), 2.795(1) Å (X=Se), and 2.829(1), 2.953(1), 2.955(1) Å (X=Te). The nature of Sb-X and Sb-I bonds is discussed in terms of the S, Se, Te substitution. Antimony-121 Mossbauer spectra have been recorded at liquid helium temperature. The data are discussed with regard to the stereochimical activity of the antimony (III) lone pair of electrons. For SbTeI the Mossbauer parameters are interpreted in terms of direct population of conductance bands by nonbonding electron pairs. (38 refs.)

101654 Preparation and properties of WP_4. N.Kinomura, K.Terao, S.Kikkawa, M.Koizumi (Inst. of Sci. & Industrial Res., Osaka Univ., Osaka, Japan).
J. Solid State Chem. (USA), vol.48, no.2, p.306-7 (1 July 1983).
Mixtures of tungsten and red phosphorous having various mixing ratios were reacted at 1000°C for 1 hr under 3 GPa in a cubic type high pressure vessel. An unknown phase was observed when the starting composition of P/W was more than 2. It was contaminated with WP_2 when $P/W<4$ and with black phosphorous when $P/W>4$. X-ray powder diffraction data are presented. Black single crystals with metallic cluster and with irregular shapes were obtained when the starting mixture of composition $P/W=4$ was held at 1000°C for 1 hr and slowly cooled to 600°C over 6 hr and then quenched to room temperature under high pressure of 3 GPa. (12 refs.)

101655 The structures of lithium inserted metal oxides: $Li_2FeV_3O_8$. R.J.Cava, A.Santoro, D.W.Murphy, S.Zahurak, R.S.Roth (Bell Labs., Murray Hill, NJ, USA).
J. Solid State Chem. (USA), vol.48, no.3, p.309-17 (15 July 1983).
Neutron diffraction powder profile analysis has been used to determine the structure of $Li_2FeV_3O_8$. The compound is prepared from FeV_3O_8, which has the $VO_2(B)$ structure type, by a lithium insertion reaction employing n-BuLi. Only minimal distortion of the host lattice occurs on Li insertion. The Li ions occupy five coordinate square pyramidal sites with an average Li-O bond distance of 2.04 Å. These five coordinate sites occur commonly in the capped perovskite cavities of crystallographic shear structures based on ReO_3. (14 refs.)

101656 Crystal structure of the 6H $BaCrO_3$ polytype. B.L.Chamberland (Dept. of Chem., Univ. of Connecticut, Storrs, CT, USA).
J. Solid State Chem. (USA), vol.48, no.3, p.318-22 (15 July 1983).
A product from the reaction between CrO_2 and Ba_2CrO_4 at 900°C under 60-65 kbar was found to be the six-layer polytype of $BaCrO_3$ from powder diffraction studies. A hexagonal black crystal obtained from this reaction was isolated for single crystal studies and structure determination. The crystal was found to possess a six-layer stacking sequence of BaO_3 layers with space group $P6_3/mmc$ and had unit cell parameters $a=5.629(2)$, $c=13.698(6)$ Å, and $Z=6$. The structure was determined from 936 independent reflections of which 693 were considered observed. Averaging equivalent reflections yielded 163 unique, observed reflections. Refinement of the structure by least-squares methods gave a conventional R value of 4.8% ($R_W=6.2\%$). The structure consists of a six-layer stacking sequence of close-packed BaO_3 layers containing tetravalent chromium in all the octahedral oxygen interstices. The compound was found to be isostructural with previously reported $BaMO_3$ phases. (18 refs.)

101657 Preparation and characterization of the system $BaBr_xCl_{2-x}$: The structure of BaBrCl. S.A.Hodorowicz, E.K.Hodorowicz, H.A.Eick (Dept. of Chem., Michigan State Univ., East Lansing, MI, USA).
J. Solid State Chem. (USA), vol.48, no.3, p.351-6 (15 July 1983).
The variations in the lattice parameters in the $BaBr_xCl_{2-x}$ system have been determined for the composition range $2.0>x>0.0$. All phases exhibit the $PbCl_2$-type orthorhombic structure and are assignable to space group $Pnma$. The crystallographic parameters of BaBrCl were determined by the Rietveld method from a line profile analysis of a digitized powder X-ray diffraction pattern. The anions are ordered with the bromide ion occupying the square pyramidal hole, and the chloride ion the smaller tetrahedral hole. Atomic coordinates are presented. (17 refs.)

101658 Channel structures based on octahedral frameworks: The crystal structure of $TlTi_5Se_8$, TlV_5Se_8, and $TlCr_5Se_8$ and its relationships to $TlCr_3S_5$, hollandites, and psilomelane. K.Klepp (Inst. fur Anorganische Chem., Tech. Hochschule Aachen, Aachen, Germany), H.Boller.
J. Solid State Chem. (USA), vol.48, no.3, p.388-95 (15 July 1983).
$TlTi_5Se_8$, TlV_5Se_8, and $TlCr_5Se_8$ are monoclinic compounds with space group C2/m which crystallise with the TlV_5Se_8 structure type. The lattice constants of these three compounds are reported using X-ray diffraction methods and least squares refinements. A unified scheme is developed for the TlV_5S_8, $TlCr_3S_5$, hallandite, and psilomelane structures on the basis of ideal close packing. (17 refs.)

101659 The synthesis and crystal structure of α-Ca_3UO_6. J.Holc, L.Golic (J. Stefan Inst., E. Kardelj Univ., Ljubljana, Yugoslavia).
J. Solid State Chem. (USA), vol.48, no.3, p.396-400 (15 July 1983).
Single crystals of α-Ca_3UO_6 were grown from a UO_3-$CaCl_2$-CaO melt by the slow cooling method from 950°C. The crystal structure was determined by means of X-ray diffraction with $R=0.032$ and $R_W=0.019$. The structure of α-Ca_3UO_6 is of Mg_3TeO_6 type. α-Ca_3UO_6 is rhombohedral with $a=6.729(1)$ Å, $\alpha=90.30$ (1)°, $Z=2$, $D_c=4.955$ g/cm^3, $D_m=4.79$ g/cm^3, space group $R3$. Uranium and calcium atoms are six-coordinated. At 1200°C rhombohedral α-Ca_3UO_6 irreversibly transforms to monoclinic β-Ca_3UO_6. (16 refs.)

101660 The crystal structure of $RbHSeO_4$: A neutron diffraction study of the paraelectric phase. I.Brach, D.J.Jones, J.Roziere (Lab. des Acides Mineraux, Univ. des Sci. et Tech. du Languedoc, Montpellier, France).
J. Solid State Chem. (USA), vol.48, no.3, p.401-6 (15 July 1983).
The structure of the paraelectric phase of $RbHSeO_4$ has been determined at 387K by neutron diffraction. The structure consists of chains of hydrogen bonded SeO_4 groups extending along the crystallographic b axis. Two different hydrogen bonds have been characterized, with O-O distances of 2.524(4) and 2.583(3) Å. In the shorter O-H-O hydrogen bond the hydrogen atom is disordered, suggesting that the ordering of hydrogen participates directly in the phase transition to the ferroelectric phase. (10 refs.)

101661 The structure of a cubic hydrogen rhenium bronze, $H_{1.36}ReO_3$. P.G.Dickens, M.T.Weller (Inorganic Chem. Lab., Oxford Univ., Oxford, England).
J. Solid State Chem. (USA), vol.48, no.3, p.407-11 (15 July 1983).
The structure of $D_{1.36}ReO_3$ has been determined by a room temperature powder neutron diffraction study. The unit cell is body centered cubic (space group $Im3$) and contains eight formula weights ($a=7.497 \pm 0.001$ Å). A least squares method based on peak intensities was used to refine the structure. The rhenium atoms lie on the special perovskite sites and are surrounded by distorted octahedra of oxygen atoms which are displaced towards the vacant perovskite A sites. The deuterium atoms are statistically distributed over 72 possible sites in the unit cell, as OD bonds. (12 refs.)

101662 · Evidence for a new eight atom B anion in $Tl_4[B_8O_{12}(OH)_4]H_2O$. M.Touboul, C.Bois (Lab. de Chimie Structurale des Materiaux, Univ. Pierre et Marie Curie, Paris, France), D.Amoussou.
J. Solid State Chem. (USA), vol.48, no.3, p.412-19 (15 July 1983). In French.
The structure solution of an hydrated thallium diborate previously formulated $Tl_2B_4O_7.2H_2O$ has led to the correct formula $Tl_4[B_8O_{12}(OH)_4]H_2O$. This compound is triclinic with $a=7.221(4)$ Å, $b=9.494(4)$ Å, $c=15.592(8)$ Å, $\alpha=114.86°(4)$, $\beta=90.25°(7)$, $\gamma=99.70°(4)$, $Z=2$, space group $P\bar{1}$. Independent reflections numbering 1594 were used in the solution and refinement of the structure to $R=0.039$ ($R_W=0.042$). The structure contains a new unit $[B_8O_{12}(OH)_4]^{4-}$, formed by four $BO_4(T)$ tetrahedra and four $BO_3(\Delta)$ triangles. In the Christ and Clark classification for borates (1977), the structural formula should be written $[B_7O_{10}(OH)_3.OBO(OH)]^{4-}$. A fundamental building block with seven boron atoms is found for the first time; the correspondent fully hydrated polyanion is $[B_7O_9(OH)_7]^{4-}$; the shorthand notation is $7{:}3\Delta+4T$. The units $[B_7O_{10}(OH)_3.OBO(OH)]^{4-}$ or $7{:}(3\Delta+4T)+\Delta$ are linked together to form an infinite chain. Tl^+ and H_2O are located between the chains. (20 refs.)

101663 Neutron and X-ray diffraction study on polymorphism in lithium orthotantalate, Li_3TaO_4. M.Zocchi, M.Gatti (Dipartimento di Chimica Industriale, Politecnico di Milano, Milan, Italy), A.Santoro, R.S.Roth.
J. Solid State Chem. (USA), vol.48, no.3, p.420-30 (15 July 1983).
The structures of the low- and high-temperature modifications of lithium orthotantalate, Li_3TaO_4, have been determined by neutron and X-ray diffraction methods. The low-temperature, or β, phase has symmetry $C2/c$ and lattice parameters $a_l=8.500(3)$, $b_l=8.500(3)$, $c_l=9.344(3)$ Å, and $\beta=117.05(2)°$. The high-temperature, or α, phase has symmetry $P2$ and lattice parameters $a_h=6.018(1)$, $b_h=5.995(1)$, $c_h=12.865(2)$ Å, and $\beta_h=103.53(2)°$. Both structures are ordered. The β-phase has a rock salt-type

structure with a 3:1 ordering of the Li^+ and Ta^{5+} ions. Its structure can be generated from the low-temperature modification by means of a complex pattern of shifts of the Ta^{5+} ions. (10 refs.)

101664 Bonding and structure of $CoSi_2$ and $NiSi_2$. J.Tersoff, D.R.Hamann (Bell Labs., Murray Hill, NJ, USA).
Phys. Rev. B (USA), vol.28, no.2, p.1168-70 (15 July 1983).
Self-consistent calculations of the electronic structure of $CoSi_2$ and $NiSi_2$ give insight into the nature of the bonding and suggest an explanation of the unique structure of these two compounds. A quasigap separates bonding and antibonding states. For $CoSi_2$ and $NiSi_2$, E_F falls in or near the quasigap. The Si atoms exhibit sp^3 hybridization, absent in many other silicides. Ionicity is negligible. Bonding is well described by a directed valence-orbital picture, except for free-electron (interstitial) character at higher energies. (9 refs.)

101665 Isomorphism among commensurate and incommensurate high-temperature phases of A_2BO_4 compounds. F.Tuinstra, A.J.van den Berg (Lab. of Appl. Phys., Delft Univ. of Technol., Delft, Netherlands).
Phase Transitions (GB), vol.3, no.4, p.275-82 (1983).
The incommensurate and commensurate superstructures of K_2MoO_4, Rb_2WO_4 and K_2WO_4 are shown to have orthorhombic symmetry rather than the hexagonal symmetry, reported earlier. The structures belong essentially to the β-K_2SO_4 type. The β-K_2SO_4 structure can be regarded as a commensurate superstructure of the α-K_2SO_4 structure by doubling of the unit cell. In this sense β-K_2SO_4 and K_2MoO_4 have the same average structures. Rb_2WO_4 displays a lock-in transition at 681K where the incommensurate distortion wave vector jumps from an incommensurate value to the value 0.5 which results in the β-K_2SO_4 type. The distortion wave vectors of the other compounds range from 0.25 to 0.5. (8 refs.)

101666 PNb_2S_{10} a new two-dimensional sulfide. Synthesis and structural characterization. R.Brec, P.Grenouilleau, M.Evain, J.Rouxel (Lab. de Chimie des Solides, UER de Chimie, Nantes, France).
Rev. Chim. Miner. (France), vol.20, no.3, p.295-304 (1983).
The new layered sulfide PNb_2S_{10} is obtained by high temperature synthesis from the elements. It crystallizes in the orthorhombic symmetry, with the parameters $a=13.739(2)$ Å, $b=12.950(1)$ Å and $c=7.211(1)$ Å, space group $P2_12_12$, Z=4 and V=1283(1) $Å^3$. The structure is built up from distorted bicapped trigonal prisms $[NbS_8]$ sharing a rectangular face to constitute $[Nb_2S_{12}]$ units (average $d_{Nb\text{-}S}=2.547$ Å). These units are bonded through the S-S prism edges and through one of the bicapping sulfur atom to make infinite $[Nb_2S_9]$ chains linked together on each side by tetrahedral $[PS_4]$ groups (average $d_{P\text{-}S}=2.051$ Å). Between the two-dimensional planes thus obtained, only van der Waals' gaps are found. Both well characterized $(S_2{}^{-II})$ and S^{-II} anionic species are present in the structure, along with niobium-niobium pairing ($d_{Nb^{IV}\text{-}Nb^{IV}}=2.869(1)$ Å). PNb_2S_{10} who's developed formula is $P_2{}^VNb_4{}^{IV}S_6{}^{-II}(S_2{}^{-II})_7$ is a diamagnetic insulator. (10 refs.)

101667 Crystal structure of MSb_3F_{10} (M=NH_4, Rb, Tl). B.Ducourant, R.Fourcade, G.Mascherpa (Univ. des Sci. et Tech. du Languedoc, Montpellier, France).
Rev. Chim. Miner. (France), vol.20, no.3, p.314-20 (1983). In French.
The crystal structure of $NH_4Sb_3F_{10}$ has been solved on single crystal $P2_1/c$ space group (R=0.07 for 1934 reflections). The structure consist of $(Sb_3F_{10})_x{}^{x-}$ layers. One can see a $Sb_2F_7{}^-$ linked with a SbF_3 unit. This kind of arrangement is quite different from the one observed in $NaSb_3F_{10}$ where exists a true $Sb_3F_{10}{}^-$ ion. (15 refs.)

101668 Study of $BaAl_4S_7$ and $BaGa_4S_7$. B.Eisenmann, M.Jakowski, H.Schafer (Eduard-Zintl-Inst., Tech. Hochschule Darmstadt, Darmstadt, Germany).
Rev. Chim. Miner. (France), vol.20, no.3, p.329-37 (1983). In German.
The new isotypic compounds $BaAl_4S_7$ and $BaGa_4S_7$ crystallize in the orthorhombic system, space group $Pmn2_1$ with the lattice constants $BaAl_4S_7$: $a=14.814\pm0.004$ Å, $b=6.218\pm0.002$ Å, $c=5.891\pm0.002$ Å; $BaGa_4S_7$: $a=14.774\pm0.004$ Å, $b=6.237\pm0.002$ Å, $c=5.934\pm0.002$ Å. AlS_4-and GaS_4-tetrahedra respectively are connected by common corners to a framework with two negative charges per formula unit resulting from the (8-N)-rule by using the number of bonds of the constituent atoms. (31 refs.)

101669 Crystallochemistry of $GaPO_4$, $AlAsO_4$ and $GaAsO_4$ phases. Comparison with α-quartz type structure. A.Goiffon, G.Bayle, R.Astier, J.-C.Jumas, M.Maurin, E.Philippot (Univ. des Sci. et Tech. du Languedoc, Montpellier, France).
Rev. Chim. Miner. (France), vol.20, no.3, p.338-50 (1983). In French.
Quartz α type $GaPO_4$, $AlAsO_4$ and $GaAsO_4$ have been synthetised and their structures have been refined at room temperature and at 173K. Between these two temperatures, the structures are completely rigid. Distortions of tetrahedral sites have been evaluated. The comparison of these three compounds with isotype phases of known structures (SiO_2, GeO_2, $AlPO_4$, $FePO_4$) shows a regular evolution of these distortions with the atomic size and the c/a ratio. (22 refs.)

101670 New fluorides of tetravalent cerium, praseodymium and terbium. K.Feldner, R.Hoppe (Inst. fur Anorganische und Analytische Chem., Justus Liebig-Univ. Giessen, Giessen, Germany).
Rev. Chim. Miner. (France), vol.20, no.3, p.351-67 (1983). In German.
The authors have prepared 22 fluorides containing Ce^{4+}, Pr^{4+} and Tb^{4+}, most of these for the first time; e.g. Cs_3CeF_7 ($a=9.94_9$ Å), Rb_3CeF_7 (9.53_7 Å), Cs_3PrF_7 (9.91_3 Å), Rb_3PrF_7 (9.51_1 Å), K_3PrF_7 (HPM:9.11 Å), Cs_3TbF_7 (9.80_1 Å), Rb_3TbF_7 (9.39_6 Å) and K_3TbF_7 (9.07_9 Å) as well as mixed fluorides like $CsRbKTbF_7$ (9.39_6 Å). All fluorides are colourless and of the $(NH_4)_3ZrF_7$-type of structure. They report the Raman Spectra of all samples. As the first fluorides of the type $A^{II}RE^{IV}F_6$ (RE=Pr, Tb) they obtained $BaPrF_6$ ($a=8.02_4$ Å, $b=11.58_0$ Å, $c=5.61_6$ Å) and $SrTbF_6$ ($a=7.69_5$ Å, $b=11.01_5$ Å, $c=5.39_7$ Å), both colourless, $RbPaF_6$-type of structure as well as $SrPrF_6$ ($a=7.09_4$ Å, $c=7.29_8$ Å), colourless, to understand as $Sr_{0.5}Pr_{0.5}F_3$ with LaF_3-type of structure, and $BaTbF_6$ of unknown structure. (32 refs.)

101671 Crystal structure of $PbZr_6F_{22}O_2$, Structural relations with KY_3F_{10}, KH_0F_7, CsU_6F_{25} and fluoride types. J.-P.Laval, B.Frit (Lab. de Chimie Minerale Structurale, UER des Sci., Limoges, France).
Rev. Chim. Miner. (France), vol.20, no.3, p.368-84 (1983). In French.
$PbZr_6F_{22}O_2$ crystallizes with hexagonal symmetry and unit-cell parameters $a=12.997(6)$ Å, $c=15.008(7)$ Å (space-group $P6_3/mcm$; Z=6). Its structure has been solved and refined to a conventional R=0.028 for 395 independent reflexions recorded on an automatic three-circle diffractometer, but on the basis of a reduced cell with parameters $a=7.504(4)$ Å, $c=15.008(7)$ Å and space group $P6_3/mmc$ (Z=2). It is an original three-dimensional framework of ZrF_7O square antiprisms with mainly two kinds of cavities. The first cuboctahedral ones contain one extra fluorine atom; the second ones more voluminous and complex contain [12+6]-coordinated Pb atoms. The structural characteristics of the $Zr_6F_{31}O_6$ clusters of the quite similar Zr_6F_{37} and $(Ca, Y)_6F_{37}$ ones found respectively in the $Na_7Zr_6F_{31}$ and $Ca_{14}Y_5F_{43}$ (tveitite) structures, or of its U_6F_{38} homologues in CsU_6F_{25} structure, as well as the structural relationships with structures like KY_3F_{10}, βKYb_3F_{10}, KHo_2F_7 or CsU_6F_{25} and αKTh_6F_{25} have been analysed and detailed. Oxygen atoms have been shown to be strictly localised within the anionic sublattice and their structural role has been emphasized. (22 refs.)

101672 Composition of the general formula $Na_xLn_{1/3}Nb_{1-x}Ti_xO_3(0\leq x\leq2/3)$. Correlation between structural evolution and photoelectric properties. G.Le Flem, D.Conte, G.Campet, J.Claverie (Univ. de Bordeaux I, Talence, France).
Rev. Chim. Miner. (France), vol.20, no.3, p.411-20 (1983). In French.
A crystal chemical study of materials with general formula $Na_xLn_{1/3}Nb_{1-x}Ti_xO_3$(Ln=La, Nd)$(0\leq x\leq2/3)$ shows in each system the existence of three new phases related to the perovskite type. The comparison between the photoelectrochemical properties of $Nd_{1/3}NbO_3$ and of $Na_{2/3}Nd_{1/3}Nb_{1/3}Ti_{2/3}O_3$ leads to a relatively accurate description of the bonding evolution due to sodium insertion. (12 refs.)

101673 Crystal structure of $Cs_4P_4O_8S_4$. V.V.Ilyukhin, V.R.Kalinin, T.B.Kuvshinova, I.V.Tananaev (N.S. Kurnakov Inst. of General & Inorganic Chem., Acad. of Sci., Moscow, USSR).
Sov. Phys.-Dokl. (USA), vol.27, no.11 (Nov. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.1-3, p.85-8 (Nov. 1982).
The crystal structure of $Cs_4P_4O_8S_4$ was studied using paper chromatography, chemical, X-ray phase, and differential thermal analyses, and IR spectroscopy. In order to decipher the crystal structure the authors used 2200 nonzero reflections $F_{hkl}{}^2$ $[I>3\sigma(I)]$, from which they constructed the three-dimensional Patterson function P(uvw). (5 refs.)

101674 Crystal structure of the α'-modification of dicalcium silicate $Ca(Ca,Sr)SiO_4$. A.M.Il'inets, N.N.Nevskii, V.V.Ilyukhin, M.Ya.Bikbau, N.V.Belov (A.V. Shubnikov Inst. of Crystallography, Acad. of Sci., Moscow, USSR).
Sov. Phys.-Dokl. (USA), vol.27, no.11, p.906-7 (Nov. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.1-3, p.641-4 (Nov. 1982).
The experimental data—660 $I(hkl)>3\sigma(I)$—were obtained from a spherical specimen with the parameters $a=20.871(2)$, b=9.496(1), c=5.600(1) Å, $\alpha=\beta=\gamma=90°$ (MoKα radiation, $\sin\theta/\lambda\leq0.7$ $Å^{-1}$). Analysis of the systematic extinctions indicated two possible space groups: $Pna2_1$ and $Pnma$. The Patterson function was found by the method of symmetrization within the framework of the first group. A series of electron-density synthesis $\rho(xyz)$ enabled 21 atoms to be located in an independent part of the unit cell. (9 refs.)

101675 Interrelation of crystal structure with physical properties in complex perovskite-type oxides. S.Nomura, K.Uchino (Tokyo Kogyo Univ., Tokyo, Japan).
Solid State Phys. (Japan), vol.18, no.2, p.71-86 (Feb. 1983). In Japanese.
In examining crystal formation mechanisms of oxides of complex perovskite ionic pairing both lawful and unlawful and the elucidation of the latter by X-ray and electron beam analysis are treated. The morphotropic phase boundary and its dependence on temperature is examined. Electronic conductivity of a complex perovskite with diffuse phase changes and dependence of conductivity on structural rules are studied. Magnetic properties and optical properties, and their coupling phenomena such as ferroelectromagnetic and electrostrictive effects are reviewed. (84 refs.) *M.O.*

101676 Neutron scattering study of brominated $(SN)_x$. L.Pintschovius, M.Kobbelt (Inst. fur Angewandte Kernphys. I, Kernforschungszentrum Karlsruhe, Karlsruhe, Germany).
Synth. Met. (Switzerland), vol.6, no.1, p.25-9 (June 1983).
Single crystals of brominated $(SN)_x$ have been ivestigated by means of elastic and inelastic neutron scattering. The results indicate that bromine is regularly incorporated into the outer parts of the $(SN)_x$ fibers, whereas the inner parts remain unchanged. (8 refs.)

101677 X-ray study of the layer structure of graphite-antimony chloride intercalation compounds. M.H.Boca (Dept. of Electrical Engng., Univ. of Kentucky, Lexington, KY, USA), M.L.Saylors, D.S.Smith, P.C.Eklund.
Synth. Met. (Switzerland), vol.6, no.1, p.39-51 (June 1983).
Presents the results of an X-ray diffraction study of stages 1, 2 and 3 graphite-antimony chloride intercalation compounds. Integrated intensity data on the $(00l)$ diffraction peaks were analyzed in terms of a centrosymmetric structural model involving periodic stacking of atomic layers of carbon, antimony and chlorine. The results of the X-ray data analyses are found to be in good agreement with recent (^{121}Sb) Mossbauer results which report large concentrations of both trivalent (Sb^{3+}) and pentavelent (Sb^{5+}) antimony in the intercalate layers. The X-ray derived stoichiometries were found to be $C_{13.2}SbCl_{4.8}$, $B_{26.9}SbCl_{5.0}$, and $C_{47}SbCl_{5.7}$ for the stage 1, 2, and 3 compounds, respectively. The authors are unable to distinguish separate contributions to a central Sb^{5+} layer from $SbCl_5$ and $SbCl_6$ molecules. The authors find the Sb^{3+} layers located at $z=\pm0.07$ Å relative to an Sb^{5+} mirror plane $(z=0)$ in the center of the intercalate layer. These locations for the Sb^{3+} layers suggest that $SbCl_3$ molecules are oriented in a configuration in which each $SbCl_3$ molecule bridges the space between bounding carbon layers. The Cl^- layers $(z=\pm1.40$ Å) were found to contact the bounding carbon layers. (27 refs.)

101678 Structures and magnetic properties of rare earth compounds in the melilite group. Y.Ochi, H.Morikawa, F.Marumo (Res. Lab. of Engng. Materials, Tokyo Inst. of Technol., Yokohama-shi, Japan), H.Nozaki.
Yogyo-Kyokai-Shi (Japan), vol.91, no.5, p.229-35 (1983). In Japanese.
A series of new rare earth compounds $Ln_2GeBe_2O_7$ (Ln=Y, La, Pr, Sm, Gd, Dy and Er) have been synthesized. With Cu Kα radiations, 1701 powder X-ray diffraction data were collected for each of these compounds by a step scan method with a step interval of 0.05° in 2θ, and the structure analysis of the compounds was carried out by the powder pattern fitting method. Atomic coordinates and isotropic temperature factors were determined by using the least-squares program PFLS-M. The crystals have tetragonal melilite structures composed of layers of GeO_4 and BeO_4 tetrahedra parallel to (001) and rare earth ions connecting the layers along the c-axis. The c-value decreased with decrease in the ionic radius of the rare earth ions between the layers, showing a typical lanthanoid contraction. The a-axis which is parallel to layers also contacted, since the size of the Be_2O_7 double pyramids became smaller with decreasing ionic radius of the rare earth ions. Comparing eight-fold coordination sites at interlayers in the present compounds with other melilites, the former was less distorted than the latter. Though the rare earth compounds usually show the magnetic transitions at low temperatures, the present compounds showed paramagnetism down to 4.8K. (23 refs.)

61.65 SPECIFIC STRUCTURE OF ORGANIC COMPOUNDS

101679 Novel example of simultaneous double N-inversion in the solid state. M.Kaftory (Dept. of Chem., Technion-Israel Inst. of Technol., Haifa, Israel).
J. Am. Chem. Soc. (USA), vol.105, no.12, p.3832-6 (15 June 1983).
Two configurational isomers (endo and exo) of the mono-adduct and one isomer (endo, endo) of the bis-adduct of 11-cyano-1,6-methano[10]annulene with 4-methyl-1,2,4-triazoline-3,5-dione have been isolated and their crystal structures determined by X-ray diffraction methods. The thermodynamically less stable isomer (exo) is transformed to the endo isomer upon heating a solid sample to ca. 175°C. This process was detected by high-temperature diffraction methods. The change of configuration is explained by a simultaneous double N-inversion with a doubly planar transition state. (18 refs.)

101680 Crystal and molecular structure of biacetyl (2,3-butanedione), $(H_3CCO)_2$, at −12 and −100°C. K.Eriks, T.D.Hayden (Dept. of Chem., Boston Univ., Boston, MA, USA), S.Hsi Yang, I.Y.Chan.
J. Am. Chem. Soc. (USA), vol.105, no.12, p.3940-2 (15 June 1983).
The crystal structure of solid biacetyl has been determined at −12 and −100°C. Crystals are monoclinic, space group $P2_1/n$, with unit cell parameters a=7.514 (29) Å, b=5.249 (22) Å, c=6.552 (21) Å, and β=116.1 (3)° at −12°C and a=7.384 (35) Å, b=5.205 (27) Å, c=6.533 (28) Å, and β=117.4 (4)° at −100°C, Z=2, d(calcd)=1.232 g cm^{-3} at −12°C, d(calcd)=1.280 g cm^{-3} at −100°C. Data were collected on a Nicolet $P2_1$ diffractometer and refined by least-squares methods to R=0.048 at −12°C and R=0.081 at −100°C. There is no phase transition between −12 and −100°C. The biacetyl molecule has the trans configuration and molecular symmetry $\bar{1}$. The most important distances are C=O=1.20 (6) Å, C-C(methyl)=1.476 (6) Å, and C-C(central)=1.540 (6) Å. The high value for the central C-C distance is discussed. The six non-hydrogen atoms are coplanar. (26 refs.)

101681 Tetramethyldithiadiselenafulvalene (TMDTDSF): properties of its hexafluorophosphate salt and alloys with tetramethyltetraselenafulvalene. F.Wudl, W.M.Walsh,Jr., J.J.Hauser, F.J.DiSalvo, D.Nalewajek, L.W.Rupp,Jr., J.V.Waszczak, R.J.Felder (Bell Labs., Murray Hill, NJ, USA), T.O.Poehler, P.M.Chaikin, R.Lacoe.
J. Chem. Phys. (USA), vol.79, no.2, p.1004-12 (15 July 1983).
Preparation and some properties of tetramethyldithiadiselenafulvalene (TMDTDSF) are described. It forms the expected $(donor)_2$ X salts. Properties of the PF_6^- salt are described as well as properties of alloys of the title compound with tetramethyltetraselenafulvalene (TMTSF). $(TMDTDSF)_2PF_6$ is a relatively poor conductor even though it is isomorphous with the high-pressure superconductor $(TMTSF)_2PF_6$. The profound difference in properties between these two solids is ascribed to disorder in the arrangement of sulfur and selenium atoms along the donor stacks in $(TMDTDSF)_2PF_6$. Alloying very small amounts of TMDTDSF into $(TMTSF)_2PF_6$ causes the metal-to-insulator transition temperature (T_{MI}) to move up smoothly from 11K for pure $(TMTSF)_2PF_6$ to ~200K for pure $(TMDTDSF)_2PF_6$ due to increasing disorder as TMDTDSF is incorporated. (21 refs.)

101682 Crystal structure of solid bromoform. R.Myers, B.H.Torrie (Guelph-Waterloo Program for Graduate Work in Phys., Univ. of Waterloo, Waterloo, Ontario, Canada), B.M.Powell.
J. Chem. Phys. (USA), vol.79, no.3, p.1495-504 (1 Aug. 1983).
The crystal structures of the three solid phases of deuterated bromoform have been determined using the neutron powder profile refinement technique. At 273K, there are two molecules per unit cell in a hexagonal structure with space group $P\bar{3}$. The molecules are statistically disordered to give a pseudo-symmetry with space group $P6_3/m$. Rapid cooling of the sample freezes out the dynamic disorder and results in a metastable structure with trigonal space group $P3$, in which a given molecule is surrounded by molecules of the opposite orientation with C-D bonds in the c direction. This structure can be viewed as being made up of molecular bilayers parallel to the basal phase with the deuterium atoms in the interior of a bilayer. The transformation from this metastable trigonal phase to the stable phase at low temperatures involves mainly a translational motion of one bilayer with respect to the neighboring bilayers. Assuming threefold molecular symmetry, this structure has been determined at 14 and 220K. It is found to be triclinic (space group $P\bar{1}$) with two molecules per unit cell. (14 refs.)

101683 Crystal structure and electronic states of dithieno[3,2-*b*:2′,3′-*d*]thiophene. F.Bertinelli, P.Palmieri, C.Stremmenos (Istituto di Chimica Fisica e Spettroscopia, Bologna, Italy), G.Pelizzi, C.Tallani.
J. Phys. Chem. (USA), vol.87, no.13, p.2317-22 (23 June 1983).
A structural, spectroscopic, and theoretical study on the electron donor dithieno[3,2-*d*:2′,3′-*d*]thiophene (DTT) crystal is presented. The crystals are monoclinic (space group $P2_1/n$) with four molecules per unit cell; atomic coordinates, bond lengths, angles, and the orientation of the optical indicatrix with respect to crystallographic axes are reported. The polarized UV absorption spectra of the single crystal, the electronic structure, and the symmetries of the first excited molecular singlet states are discussed, the observed transitions being compared with the results of an extended ab initio SCF/CI computation using the STO/3G expansion of atomic orbitals. Evidence of a strong 3^1A_1-1^3B_2 spin-orbit interaction leading to an efficient intersystem crossing to the first excited triplet state is deduced from the emission spectra. (14 refs.)

101684 Lattice parameters, thermal expansion coefficients, and vacancy density in solid CD_4. A.I.Prokhvatilov, A.P.Isakina (Phys.-Tech. Inst. of Low Temperatures, Acad. of Sci., Kharkov, Ukrainian SSR).
Phys. Status Solidi a (Germany), vol.78, no.1, p.147-55 (16 July 1983).
X-ray measurements of lattice parameters of deuteromethane are carried out in the range 5 to 89.5K. The density, molar volumes, and thermal expansion coefficients are found, as well as magnitudes of volume changes at phase transitions and melting. The constant-volume heat capacity, Gruneisen constants, adiabatic and isothermal compressibilities are calculated. Comparing the X-ray and the extrapolated dilatometric thermal expansion coefficients, the density, volume and formation enthalpy of thermal equilibrium vacancies are estimated. The values obtained are compared with those observed in methane and solid noble gases. (24 refs.)

101685 Crystal and molecular structure of 1,6,9,12,17,20-hexaoxacyclodocosane-2,5,13,16-tetra-one. S.T.Malinovskii, Yu.A.Simonov, N.G.Luk'yanenko, V.A.Shapkin, T.L.Malinovskii (Inst. of Appl. Phys., Acad. of Sci., Kishinev, Moldavian SSR).
Sov. Phys.-Dokl. (USA), vol.27, no.11, p.895-6 (Nov. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.1-3, p.88-91 (Nov. 1982).
The authors study the structure of the twenty-two membered macrocycle 1,6,9,12,17,20-hexaoxacyclodocosane-2,5,13,16-tetra-one. For the investigation they chose a colorless single crystal of prismatic habit with dimensions 0.4×0.5×1.2 mm. The experimental data were obtained on a computer (M-600)-controlled DAR-UMB diffractometer in CuKα radiation by the combined ω-$\theta/2\theta$ method. For the calculation they used 1526 reflections with $I \geq 3\sigma(I)$. The structure was solved by direct methods using the YANX program. (9 refs.)

101686 Crystal and molecular structure of dioximeacetone thiosemicarbazone. B.Ya.Antosyak, V.N.Biyushkin, T.I.Malinovskii, N.I.Belicheuk (Inst. of Appl. Phys. & Inst. of Chem., Acad. of Sci., Kishinev, Moldavian SSR).
Sov. Phys.-Dokl. (USA), vol.27, no.11, p.901-3 (Nov. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.1-3, p.382-5 (Nov. 1982).
The authors have carried out an X-ray diffraction investigation of dioximeacetone thiosemicarbazone, of composition $C_4H_7N_5O_2S$. The crystals were pale yellow, needle-shaped, and of rhombic syngony. The crystal characteristics were: a=11.429(6), b=16.583(6), c=4.307(5) Å; space group $P2_12_12_1$; Z=4; d_{calc}=1.55 $g.cm^{-3}$, μ (CuKα)=34.7 cm^{-1}. Intensities of 813 independent reflections with $I>2\sigma$ were measured on the DAR-UMB diffractometer. The structure was solved by the heavy-atom method and refined by the least-squares method in the isotropic approximation to R=0.088. (1 ref.)

101687 Fresnel fringe contrast of faceted voids within gem-quality diamond. J.L.Hutchison, L.A.Bursill (Dept. of Metall. & Sci. of Materials, Univ. of Oxford, Oxford, England).
J. Microsc. (GB), vol.131, pt.1, p.63-6 (July 1983).
The topology of faceted void-like defects ('voidites') in gem-quality type Ia diamonds has been revealed by high resolution phase-contrast electron microscopy. Interpretation of the images in terms of a Fresnel contrast mechanism allows the defects to be identified as octahedral in shape. Image contrast is sensitive to defocus and other parameters, and Fresnel fringe interference effects may generate 'superlattice'-like contrast. (6 refs.)

101688 Lattice relaxation, radiative and non-radiative deexcitation at localized defects. J.M.Langer (Inst. of Phys., Polish Acad. of Sci., Warsaw, Poland).
Radiat. Eff. (GB), vol.72, no.1-4, p.55-72 (1983). (Proceedings of the Fourth Europhysical Topical Conference on 'Lattice Defects in Ionic Crystals', Dublin, Ireland, 29 Aug.-3 Sept. 1982).
The influence of defect-lattice coupling on energy structure and recombination processes at localized defects is discussed. The emphasis is put on those processes in which the charge state of the defect changes. Among the topics discussed are: extrinsic self-trapping, negative U defects, metastable defect states, multiphonon recombination and recombination induced defect reactions. (59 refs.)

101689 X-ray and dilatometric investigation of defect structure in strontium chloride. G.Daniel, J.Nolting (Inst. fur Phys. Chem., Univ. Gottingen, Gottingen, Germany).
Ber. Bunsenges. Phys. Chem. (Germany), vol.87, no.7, p.562-6 (July 1983). In German.
$SrCl_2$ crystallizes in the fluorite structure and shows, like all materials with this structure, anomalous properties with regard to thermodynamic as well as to transport phenomena. In a temperature region starting about 200K below the melting point (1146K) a pronounced maximum of c_p is found, which is identified with a Schottky anomaly. Most significant are the increasing values of ionic conductivity with rising temperature. They mostly exceed those of a typical ionic melt. The degree of the 'molten' anion lattice and the distinct places of the defect ions are not clarified until now. The temperature of transition at the maximum of the expansion coefficient value at T=1000K has been determined by dilatometric measurements. The existence of predominant Frenkel disorder has been demonstrated by comparing X-ray and dilatometric measurements. The ratio of ionic radii relative to the configuration in the fluorite structure has been determined from the lattice parameter and the crystal structure. The enthalpy of formation of Frenkel disorder has been calculated from dilatometric measurements as $\Delta H_f=(248\pm8)$ kJ mol. (29 refs.)

101690 Threshold energy surface and Frenkel pair resistivity for Cu. W.E.King, K.L.Merkle (Argonne Nat. Lab., Argonne, IL, USA), M.Meshii.
J. Nucl. Mater. (Netherlands), vol.117, p.12-25 (July 1983). (Proceedings of the Symposium on Radiation Damage Analysis for Fusion Reactors, St. Louis, MO, USA, 25-28 Oct. 1982).
In-situ electrical resistivity damage-rate measurements in the high voltage electron microscope have been used to study electron irradiation induced defect production in copper single crystals at $T<10K$. Analysis of the directional and energy dependence yields a threshold energy surface that is significantly different from those of previous investigations: two pockets of low threshold energy centered at ⟨100⟩ and ⟨110⟩ surrounded by regions of much higher threshold energy. The corresponding damage function exhibits a plateau at 0.6 Frenkel pairs. The present results imply a Frenkel pair resistivity for Cu of $(2.75_{-0.2}^{+0.6})\times10^{-4}\ \Omega$ cm. (26 refs.)

101691 Structure of small defects in nonstoichiometric WO_{3-x}. L.A.Bursill (School of Phys., Univ. of Melbourne, Parkville, Victoria, Australia).
J. Solid State Chem. (USA), vol.48, no.2, p.256-71 (1 July 1983).
Structural models are derived for the hitherto 'unresolved' small defects which should occur in the nonstoichiometric phase WO_{3-x}. The mechanisms of aggregation or interaction of these small defects to produce extended defect structures (i.e. crystallographic shear plane and pentagonal and/or hexagonal tungsten bronze-type columns) are discussed next. Linear defects, consisting of two pairs of edge-shared octahedra, are proposed. These readily explain the large number of electron microscope observations of precipitation and dissolution phenomena reported for reduced WO_{3-x} and doped tungsten trioxide specimens. (31 refs.)

101692 Calculations of the binding of hydrogen to fixed interstitial impurities in nickel. M.S.Daw, C.L.Bisson, W.D.Wilson (Sandia Nat. Labs., Livermore, CA, USA).
Metall. Trans. A (USA), vol.14A, no.7, p.1257-60 (July 1983).
The authors have calculated the binding energy of hydrogen to inert, fixed interstitial impurity atoms He, Ne, Ar, Kr and Xe and also the chemically active impurities C, O, and Ni using local density functional theory including lattice relaxation. (11 refs.)

101693 Theory of strongly relaxed defects in crystalline and amorphous oxides. W.B.Fowler (Dept. of Phys., Lehigh Univ., Bethlehem, PA, USA).
Radiat. Eff. (GB), vol.72, no.1-4, p.27-38 (1983). (Proceedings of the Fourth Europhysical Topical Conference on 'Lattice Defects in Ionic Crystals', Dublin, Ireland, 29 Aug.-3 Sept. 1982).
Large, asymmetric atomic relaxations have been shown to play a crucial role in the structure and properties of several point defects in oxide materials. Examples include trapped hole centers in alkaline-earth oxides and E_1' and E_4' oxygen-vacancy centers and peroxy-radical defects in silicon dioxide. Schirmer's 'bound small polaron' model (1974, 1976), applied in particular to the alkaline-earth oxide defects, and model treatments of the E_1' center in SiO_2 by Yip, Griscom and Fowler (1974) clearly illustrate the important spectroscopic consequences of such atomic relaxations. In fact, such effects has been incorporated in Luty's classic model of the Type II F_A center in alkali halides. Edwards and Fowler (1982) have applied MNDO and MINDO/3 quantum-chemistry approaches to the E_1', E_4', and peroxy radical defects in SiO_2. These calculations generally corroborate suggested models and bear as well on possible creation mechanisms. Large relaxation effects are likely to be important in many other defects in oxide materials. (73 refs.)

101694 Study of defect formation in irradiated KL and KI(Pb) by Raman scattering and optical absorption techniques. J.D.Comins, A.M.T.Allen, P.J.Ford, D.A.Matthews (Dept. of Phys., Univ. of the Witwatersrand, Johannesburg, S Africa).
Radiat. Eff. (GB), vol.72, no.1-4, p.107-14 (1983). (Proceedings of the Fourth Europhysical Topical Conference on 'Lattice Defects in Ionic Crystals', Dublin, Ireland, 29 Aug.-3 Sept. 1982).
Studies of the growth of halogen molecular complexes induced in KI and KI(Pb) have been made by Raman scattering and optical absorption techniques. Their behaviour is consistent with the ideas of halogen cluster development resulting from the sequential trapping of halogen interstitials. Comparison of the results with recently published studies of KI and KI(Ca) shows that the defects responsible for the Raman scattering (I_3^- and higher order interstitial complexes) have the same basic nature independent of the presence of nearby impurities. Evidence that lead impurities stablize halogen interstitials is presented. (12 refs.)

61.70D Colour centres

101695 High resolution laser spectroscopy of colour centres. R.M.Macfarlane, R.T.Harley, R.M.Shelby (IBM Res. Lab., San Jose, CA, USA).
Radiat. Eff. (GB), vol.72, no.1-4, p.1-11 (1983). (Proceedings of the Fourth Europhysical Topical Conference on 'Lattice Defects in Ionic Crystals', Dublin, Ireland, 29 Aug.-3 Sept. 1982).
The application of narrow band dye lasers to high resolution spectroscopy within the inhomogeneously broadened zero-phonon lines of colour centres is reviewed. Most work so far has centred on the use of holeburning which is exhibited by the majority of centres examined. This technique has been used to make detailed Stark and Zeeman effect measurements. In addition, optical coherent transients have been used to determine dephasing times and the results of optical phase switching and free decay experiments are discussed. (22 refs.)

101696 Magnetic properties of optically excited states of colour centres. M.Glasbeek (Lab. for Phys. Chem., Amsterdam, Netherlands).
Radiat. Eff. (GB), vol.72, no.1-4, p.13-25 (1983). (Proceedings of the Fourth Europhysical Topical Conference on 'Lattice Defects in Ionic Crystals', Dublin, Ireland, 29 Aug.-3 Sept. 1982).
A review is given of recent developments in the study of magnetic (localized) photo-excitations in ionic solids. Emphasis is on the three topics: (i) the importance of magnetic properties in the structural characterization of defects; (ii) photo-chemical reactions as revealed from magnetic interactions in point defects and (iii) energy and phase relaxation dynamics in photo-excited colour centres as probed from magnetic transients. The author focuses on defects photo-excited to phosphorescent triplet states. In discussing a number of dynamical processes, some attention is given to the application of (optical-microwave) coherence spectroscopy which holds considerable promise for future work. (28 refs.)

101697 Picosecond measurement of relaxation in color centers. L.F.Mollenauer, J.M.Wiesenfeld (Bell Telephone Labs., Holmdel, NJ, USA), E.P.Ippen.
Radiat. Eff. (GB), vol.72, no.1-4, p.73-9 (1983). (Proceedings of the Fourth Europhysical Topical Conference on 'Lattice Defects in Ionic Crystals', Dublin, Ireland, 29 Aug.-3 Sept. 1982).
Describes techniques for the direct measurement of configurational relaxation times in color centers. The first such measurements, on the F_A(II) center in KCl:Li, yield a zero-temperature lifetime of 13 psec. Measured temperature dependence of the lifetime indicates that the relaxation is dominated by a phonon mode of energy ~47 cm^{-1}. The possibility of extending the measurements to other centers is discussed. (17 refs.)

101698 Bound triplet state of the F′ center in NaI. G.Baldacchini, G.P.Gallerano (ENEA, Roma, Italy), U.M.Grassano, F.Luty.
Radiat. Eff. (GB), vol.72, no.1-4, p.153-9 (1983). (Proceedings of the Fourth Europhysical Topical Conference on 'Lattice Defects in Ionic Crystals', Dublin, Ireland, 29 Aug.-3 Sept. 1982).
The astonishing feature that the F′ band in NaI is located on the high energy side (2.4 eV) of the F band (2.1 eV) indicates an unusually deep-lying F′ singlet ground state and suggests the possible existence of a bound triplet state in this material. Absorption measurements during the $F\rightarrow F'$ conversion show indeed the appearance of a weak band of large width (~0.5 eV) around 1.45 eV, conversion show indeed the appearance of a weak band of large width (~0.5 eV) around 1.45 eV, which decays spontaneously in the dark with a liftime of 540 sec. Its formation is found to be enhanced in high

magnetic fields when the F$\rightarrow$(F′ singlet) conversion is suppressed due to spin polarization of the F electrons. The authors interpret this band to be caused by a bound metastable triplet state of the two F′ electrons, with the 1.45 eV optical excitation leading into the conduction band. (7 refs.)

101699 M_A-type centers in alkaline-earth doped KCl. L.Bosi (Istituto di Fisica Politecnico di Milano, Milano, Italy).
Radiat. Eff. (GB), vol.72, no.1-4, p.167-70 (1983). (Proceedings of the Fourth Europhysical Topical Conference on 'Lattice Defects in Ionic Crystals', Dublin, Ireland, 29 Aug.-3 Sept. 1982).
The authors present: a critical analysis of the results known in literature on the absorption and emission properties of the Z_4-center in divalent doped KCl crystals; evidence, by lifetime measurements, of the existence of an M_A-type center, whose absorption band strongly overlaps that of the Z_4-center; a discussion of the radiative lifetime values obtained by the author for the excited state of the M_A- and M_A-type centers and the unperturbed M-center; discussion on the correctness of the models for the Z_4-center, supported by indirect proof of the Briginets model (Z_4-center analog of the N_1-center in undoped alkali halides) has been achieved. (18 refs.)

101700 The spin-lattice relaxation and spin-orbit interaction of F center in the relaxed excited state. H.Ohkura, K.Iwahana, K.Tara, M.Hirata, Y.Mori (Dept. of Appl. Phys., Osaka City Univ., Osaka, Japan).
Radiat. Eff. (GB), vol.72, no.1-4, p.171-5 (1983). (Proceedings of the Fourth Europhysical Topical Conference on 'Lattice Defects in Ionic Crystals', Dublin, Ireland, 29 Aug.-3 Sept. 1982).
The spin-orbit interaction constant λ_{RES} in the relaxed excited state of an F center (RES) and the temperature dependence of spin-lattice relaxation time in the RES have been determined via the study of magnetic circular polarization of F center emission (MCP). An essential factor for this determination lies in the experimental estimation of the proportionality constant F_p between the paramagnetic component of MCP and spin polarization in the RES. The values of F_p and λ_{RES} disagree with those proposed previously. The origin of the discrepancy is discussed. (15 refs.)

101701 M-center growth in alkali halides: computer simulation. M.Aguilar, F.Jaque, F.Agullo-Lopez (Univ. Autonoma de Madrid, Madrid, Spain).
Radiat. Eff. (GB), vol.72, no.1-4, p.193-200 (1983). (Proceedings of the Fourth Europhysical Topical Conference on 'Lattice Defects in Ionic Crystals', Dublin, Ireland, 29 Aug.-3 Sept. 1982).
The heterogeneous interstitial nucleation model previously proposed to explain F-center growth curves in irradiated alkali halides has been extended to account for M-center kinetics. The interstitials produced during the primary irradiation event are assumed to be trapped at impurities and interstitial clusters or recombine with F and M centers. For M-center formation two cases have been considered: (a) diffusion and aggregation of F centers, and (b) statistical generation and pairing of F centers. Process (b) is the only one consistent with the quadratic relationship between M and F center concentrations. However, to account for the F/M ratios experimentally observed as well as for the role of dose-rate, a modified statistical model involving random creation and association of F^+-F pairs has been shown to be adequate. (11 refs.)

101702 F^+ centre in (Ca-Sr) carbonated hydroxyapatites. G.Bacquet (Lab. de Phys. des Solides, CNRS, Toulouse, France), M.Sbit, M.Vignoles, G.Bonel.
Radiat. Eff. (GB), vol.72, no.1-4, p.299-302 (1983). (Proceedings of the Fourth Europhysical Topical Conference on 'Lattice Defects in Ionic Crystals', Dublin, Ireland, 29 Aug.-3 Sept. 1982).
Powdered samples of synthetic carbonated hydroxyapatites with variable amounts of strontium substituting for calcium, obtained by precipitation, were studied by ESR at the X-band frequencies after heating at 400°C for 24 h, X-irradiation and annealing at 150°C for 30 min. The F^+ centre spectrum exhibiting orthorhombic symmetry was recorded between RT and 120K, with $\langle g \rangle \simeq 2$. When the amount of carbonate inside the samples increases, the spectral intensity has the same behaviour as that of the quantity of O^{2-} vacancies calculated from the results of chemical analysis. The results are a confirmation of the existence of two different mechanisms of charge compensation when ${CO_3}^{2-}$ substitutes for ${PO_4}^{3-}$, and they also show that Sr ions are not located in cation sites adjacent to carbonate ions. 61.70G Dislocations: theory

101703 Model of acoustic emission from accelerated dislocations. M.Jaszczewski (Inst. of Nuclear Phys., Cracow, Poland).
Acta Phys. Pol. A (Poland), vol.A64, no.1, p.69-75 (July 1983).
A model of acoustic emission signals generated by nonuniform motion of dislocations is presented. The acceleration of dislocations is given by the Dirac δ-function. Detection system influence on acoustic emission signal is taken into account and the Laplace transform is applied to solve it in agreement with the causality requirement. It is shown that for a wide range of the values for the total length of dislocations and for the sudden change of their velocities the analyzed model can explain the observed pulses of acoustic emission. (7 refs.)

101704 The theory of dynamic sink strengths. H.Rauh, R.Bullough, M.H.Wood (Theoretical Phys. Div., AERE, Harwell, England).
Proc. R. Soc. London Ser. A (GB), vol.388, no.1795, p.311-33 (8 Aug. 1983).
Dynamic sink strengths for the void, dislocation and thin foil surfaces are derived using a cellular model. These can be used in the chemical rate theory analysis of non-steady irradiation damage. In particular, appropriate dynamic sink strengths to model a steady state pulsing regime, such as is expected to prevail in the fusion reactor, are obtained. The transient nature of these sink strengths indicates the importance of the relative mobilities of the interstitials and vacancies and can, in fact, lead to the new phenomenon of a dynamic preference for vacancies, even for a sink that has a static preference for interstitials. The general dynamical features are found to depend also on both the irradiation mode and on the morphology of the particular sink. The present results indicate that for steady-state pulsing conditions it is usually acceptable to replace the dynamic sink strengths in rate theory calculations, by the corresponding steady state sink strengths appropriate to continuous irradiation. However, the dynamic sink strengths do appear to be required for the study of damage during the initial transient under continuous irradiation conditions. (11 refs.)

101705 Disclinations in solids. A.E.Romanov, V.I.Vladimirov (A.F. Ioffe Physico-Tech. Inst., Acad. of Sci., Leningrad, USSR).
Phys. Status Solidi a (Germany), vol.78, no.1, p.11-34 (16 July 1983).
An attempt has been made to embrace a wide class of problems on theoretical study and experimental proofs of the existence of disclinations in solids and about their role in various physical processes. The main attention is given to the progress in the disclination theory of strength and plasticity as the most promising direction in studying the behaviour of strongly deformed materials and constructing a physical theory of mechanical treatment of metals and alloys. Another important question fully represented is the analysis of the disclination elastic fields—the starting point in considering the properties of disclinations in different substances. (200 refs.)

101706 Electron-microscopic investigation of α-planar defects formed by boron in alloys of refractory metals with the BCC lattice. I.I.Novikov, R.M.Sofronova, V.I.Chervinskii (A.A. Baikov Inst. of Metall., Acad. of Sci., Moscow, USSR).
Fiz. Met. & Metalloved. (USSR), vol.55, no.6, p.1179-86 (June 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
Planar α-type defects loaded in $\{100\}$ planes in Mo-0.003% B-0.003% C-0.09% Zr and Cr-0.04% B (wt.%) alloys were investigated by the average contrast method developed earlier by two of the present authors [R.M. Sofronova and V.I. Chervinskii, Phys. Status Solidi A 66, 103 (1981)]. The displacement vectors $\langle d\ 0\ 1/2 \rangle$ and $\langle 2d\ 0\ 0 \rangle$, where $d \approx 1/6$ is the component normal to the defect plane, were determined by the precipitation of the B atoms in the form of single and double layers. The Burgers vector of the surrounding dislocations was $\mathbf{b}=\mathbf{R}$. Models of defects based on the hard sphere approximation indicated that they probably represented an intermediate stage in the growth of borides. (11 refs.) *A.T.*

101707 Dislocation motion in a dispersion hardened Al-Zn-Mg alloy and its plastic properties. U.Messerschmidt (Inst. fur Festkorperphys. und Elektronenmikroskopie, Akad. der Wissenschaften, Halle, Germany), F.Appel, M.Bartsch, R.Gerlach.
Phys. Status Solidi a (Germany), vol.78, no.1, p.93-102 (16 July 1983).
Al-Zn-Mg specimens are annealed to contain η' precipitates. They are deformed inside the high-voltage electron microscope and in a macroscopic compression machine. Under stress the dislocations strongly bow out between localized obstacles. The respective stress corresponds to about two thirds of the yield stress. Other contributions are due to the long-range dislocation interactions and, perhaps, the induced Snoek effect. The alloy deforms predominantly in an athermal mode. (22 refs.)

101708 Dislocation structures and subgrain boundaries in Al_3Zr. E.K.Polychroniadis, O.Delavignette (Materials Sci. Dept., CEN/SCK, Mol, Belgium).
Phys. Status Solidi a (Germany), vol.78, no.1, p.287-301 (16 July 1983).
The dislocation dissociation in the DO_{23} structure of Al_3Zr is performed by a contrast experiment in TEM and confirmed by a precision analysis of low angle grain boundary characteristics. In particular, the precision determination of the angle of rotation at subgrain boundaries allows a determination of amplitudes of Burgers vectors. The type of dissociation is interpreted in terms of the characteristics of the ordered lattice. (2 refs.)

101709 Dislocations in germanium: Effects of plasma hydrogenation. S.J.Pearton, J.M.Kahn (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).
Phys. Status Solidi a (Germany), vol.78, no.1, p.K65-9 (16 July 1983).
The authors investigate the effects on electrical activity of exposing undeformed, ultra-pure germanium samples containing $\approx 10^4$ cm^{-2} dislocations to various plasmas. The samples used were cut perpendicular to the axis of crystal growth, either [113] or [100], and the dislocations counted by using the preferential etch treatments. The reduction in electrical activity was measured using a DLTS study. (10 refs.)

101710 Nature of defects in heavily Te-doped GaAs. D.L.Williamson, M.Kowalchik (SERI, Golden, CO, USA), A.Rocher, P.Gibart.
Rev. Phys. Appl. (France), vol.18, no.8, p.475-8 (Aug. 1983).
Heavily Te-doped GaAs has been studied by ^{125}Te Mossbauer spectroscopy and transmission electron microscopy (TEM). It is shown that for N_D-$N_A > 10^{19}$ cm^{-3}, microprecipitates are observed along dislocation loops on TEM micrographs whereas a quadrupole split second site appears in Mossbauer spectra. Both features are consistent with the existence of microprecipitates of gallium telluride, Ga_2Te_3. (10 refs.)

61.70L Slip, creep, internal friction and other indirect evidence of dislocations

(see also 62.20H Creep, 62.40 Internal friction)

101711 Glide mechanisms in BCC crystals: an investigation of the case of α-iron through multislip and latent hardening tests. P.Franciosi (Lab. PMTM, Univ. Paris-Nord, Villetaneuse, France).
Acta Metall. (USA), vol.31, no.9, p.1331-42 (Sept. 1983).
Multislip and latent hardening tensile tests are performed on α-iron single crystals at room temperature, in order to check the assumption of crystallographic glide restricted to the $\{110\}$ planes and the $\{112\}$ asymmetric planes. The evidence of a macroscopic glide either following higher indexed planes or the maximum resolved shear stress plane (referred as 'noncrystallographic glide') is interpreted, through a theoretical approach of multislip situations—in terms of mechanics of continuous media and of plasticity theory—as colinear glide on a $\{110\}$-$\{112\}$ neighbouring planes pair. The observed hardening behaviour allows to interpret the influence of the axis orientation on the preferred slip mode. The latent hardening tests are performed according to the assumption of glide on $\{110\}$ and $\{112\}$ planes. The experimental results are not consistent with a description of plastic flow resulting from four noncrystallographic slip systems only defined by the $\langle 111\rangle$ slip direction. A hardening law, previously derived from tests on FCC crystals, is extended in the simplest way in order to analyze the latent hardening tests results and to represent the main features of the observed plastic behaviour of the α-iron crystals. (22 refs.)

101712 Dislocation wall and cell structures and long-range internal stresses in deformed metal crystals. H.Mughrabi (Max-Planck-Inst. fur Metallforschung, Stuttgart, Germany).
Acta Metall. (USA), vol.31, no.9, p.1367-79 (Sept. 1983).
Long-range internal stresses in deformed metals have traditionally been associated primarily with the existence of dislocation pile-ups. Recent experimental work has shown, however, that long-range internal stresses prevail also in crystals containing dislocation wall or cell structures which have so far been considered as energetically favourable dislocation patterns of negligible internal stress. These experimental results are interpreted in terms of a simple model in which the crystal is considered as a composite consisting of hard dislocation walls of high local dislocation density which are separated by soft regions of low local dislocation density. The model is developed for single-slip and multiple-slip deformation. The considerations show that, in crystals in which a heterogeneous dislocation distribution develops during deformation, substantial long-range internal stresses arise unavoidably as a natural consequence of the compatibility requirements in the stress-applied state. A discussion of the microscopic glide processes makes it evident that, in addition to the dislocations located in the walls and in the regions separating them, so-called 'interface dislocations' must be considered also. (73 refs.)

101713 The stresses of planar dislocation multipoles in plastically deformed Cu-Al crystals. N.R.Comins (Nat. Inst. for Materials Res., CSIR, Pretoria, S Africa), P.J.Jackson.
S. Afr. J. Phys. (S. Africa), vol.6, no.1, p.7-11 (1983).
Realistic calculations are presented of the stresses on secondary glide systems inside planar dislocation multipoles. The stresses are much larger than the yield stress, but they are too localized to cause secondary slip. It is suggested that dislocation grids observed in the later stages of deformation are produced when multipoles become plastically relaxed as a result of the superposition of internal stresses. 61.70N Grain and twin boundaries

101714 Grain boundary motion in vanadium. A.Juhasz, I.Fozy, P.Tasnadi, I.Kovacs (Inst. for General Phys., Roland Eotvos Univ., Budapest, Hungary), I.Vitanyi.
Acta Phys. Acad. Sci. Hung. (Hungary), vol.53, no.3-4, p.455-68 (1982). [received: Aug. 1983] (CRYOSEM '81. Second International Seminar on Low Temperature Physics, Visegrad, Hungary, 8-10 Oct. 1981).
Grain boundary motion has been investigated 'in situ' in 99.9% purity V sheets in a microscope. The individual grain boundary motion has been followed by the grooves etched thermally on the surface of the sample. The velocity of individual grain boundaries has been measured and compared to the average velocity determined from the normal gain growth law. An analysis of the relation between the velocity of curved boundaries and their curvature is given. The results obtained prove that in the applied experimental circumstances the driving force of the grain boundary motion is the surface energy of the boundaries. Finally, a simple geometrical model is given for explaining the spasmodic migration of the boundaries joined to the surface, as well as the observed sudden breaking of certain grains. (27 refs.)

101715 Inheritance of twin boundaries as a mechanism of the shape memory. G.E.Brainin, A.E.Volkov, V.A.Likhachev (A.A. Zhdanov State Univ., Leningrad, USSR).
Fiz. Met. & Metalloved. (USSR), vol.55, no.6, p.1045-50 (June 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
A crystal-geometric analysis is made of the 'inheritance' of twin boundaries in a martensitic phase during the reverse martensitic transition. It is shown that in the course of such a transition there may be some disaccommodation at the boundaries of 'inherited' martensite twins and this effect can increase considerably the elastic energy of the system. A physical mechanism is proposed for the shape memory. This mechanism makes it possible to calculate the deformation in the course of recovery of the shape, reactive stresses, elastic energy, and mechanical work on the basis of the crystallographic features of twinning and martensitic transitions in specific alloys. (6 refs.) *A.T.*

101716 Conductivity and 'negative *U*' for ionic grain boundaries. D.M.Duffy (Dept. of Phys., Univ. of Reading, Reading, England), A.M.Stoneham.
J. Phys. C (GB), vol.16, no.21, p.4087-92 (30 July 1983).
The authors show that charge-transfer excitations (like $2M^{2+} \rightarrow M^{+} + M^{3+}$) can be lowered greatly in energy near grain boundaries, where sites are no longer equivalent. In special cases the excitations may be exothermic ('negative-*U*' behaviour); likely cases include (320) and (122) grain boundaries in FeO. Consequences include effects on conductivity, segregation of impurities with different valence, and on other charge-state-dependent properties. (17 refs.)

101717 Non-equilibrium state and recovery of grain boundary structure. II. Energetic analysis. R.Z.Valiev, V.Yu.Gertsman, O.A.Kaibyshev (Aviation Inst., Ufa, USSR).
Phys. Status Solidi a (Germany), vol.78, no.1, p.177-86 (16 July 1983).
For pt.I see ibid., vol.77, p.97 (1983). The energy of grain boundary (GB) with non-equilibrium structure caused by trapped lattice dislocations (TLD's) and TLD dissociation products—extrinsic grain boundary dislocations (EGBDs)—are estimated. The process of GB structure recovery, i.e. transition of non-equilibrium GB structure into equilibrium state, is analysed on the basis of the model of TLD dissociation into EGBD's and EGBD uniform distribution in GB. A process of this type appears to be energetically favoured for GB's of any type. The kinetics of the recovery of GB structure which is of diffusional character is considered. The differences in TLD stability in various GB's are caused by kinetic reasons. In the process of TLD absorption GB's possess non-stationary structure, which is of great importance for GB behaviour during deformational processes. (29 refs.)

101718 Particular properties of $\Sigma = 3^n$ boundaries in FCC polycrystals. I. Crystallographical parameters and grain boundary faceting during annealing. G.D.Sukhomlin (All-Union Sci. Res. Tube Inst., Dnepropetrovsk, USSR), A.V.Andreeva.
Phys. Status Solidi a (Germany), vol.78, no.1, p.333-41 (16 July 1983).
The crystallographic parameters and faceting during annealing of $\Sigma = 9$; 27; 81; 243 special grain boundaries in stainless steel and copper are investigated by the TEM technique. The preferential facet orientation parallel to closely packed $\{Okl\}$ planes of CSL is supposed to be due to a special feature of the $\Sigma = 3^n$ boundary formation, which is realized by multiple interaction of $\Sigma = 3$ twin boundaries. A strong agreement is observed between the experimental rotation angles and theoretical ones. It is concluded that $\Sigma = 3^n$ boundaries

may serve as standards for further investigations of grain boundaries in polycrystalline materials. (13 refs.)

101719 Microtwins in $LiNbO_3$ crystals observed by high-voltage and high-resolution electron microscopy. L.Malicsko (Res. Lab. of Crystals Phys., Hungarian Acad. of Sci., Budapest, Hungary), R.Scholz.
Phys. Status Solidi a (Germany), vol.78, no.1, p.K1-4 (16 July 1983).
Twin stacks were observed by HVEM and HREM in $LiNbO_3$ crystals, thus enabling their reliable characterization. The twin stacks were found preferentially in strongly non-stoichiometric, red-brown samples. This fact supports the formation of twin stacks to be closely connected with stoichiometric deviations in $LiNbO_3$, especially with oxygen deficiencies. The deviations found in the form and in the orientation of the twin boundaries within the twin stacks allow one to assume that the twin stacks are grown-in defects. (16 refs.)

101720 Conditions of formation and growth of mechanical twins at the tip of a dynamic crack. A.P.Korolev, V.A.Fedorov, Yu.I.Tyalin (Tambov Chem. Engng. Inst., Tambov, USSR).
Strength Mater. (USA), vol.14, no.6, p.824-8 (June 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.6, p.93-7 (June 1982).
An analysis is made of the physical conditions of formation and growth of accompanying twins at the tip of a rapidly developing crack using as an example Fe+3.25% Si. It should be noted that the analysis is not a strict calculation of the quantitative characteristics of formation and propagation of accompanying twins. Its results present a concept of the condition of their formation and growth at the tip of rapid rupture. (10 refs.)

101721 Measurement of grain boundary parameters by laser-spot photoconductivity. E.Poon, H.L.Evans, W.Hwang, R.M.Osgood,Jr., E.S.Yang (Dept. of Electrical Engng., Columbia Univ., New York, NY, USA).
Laser Diagnostics and Photochemical Processing for Semiconductor Devices. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.103-8
An experimental technique has been developed to study the electrical properties of semiconductor grain boundaries (GBs) by a focused laser beam. The laser beam is trained on a GB while the photoconductivity of the sample is measured. Both the steady-state and transient signals are recorded as functions of temperature. From these data, the authors obtain well-defined GB parameters, including the barrier height, interface charge density, trap energy and thermal capture cross-section. This technique allows them to examine localized regions of individual GBs in a semiconductor with multiple grains. (8 refs.)

61.70P Stacking faults, stacking fault tetrahedra and other planar or extended defects

101722 High resolution electron-microscope studies on a quenched $(Ni_{0.5}Cr_{0.5})_7Nb_6$ alloy. L.Douxing, L.Stenberg, S.Andersson (Chem. Center, Lund, Sweden).
J. Solid State Chem. (USA), vol.48, no.3, p.368-75 (15 July 1983).
Crystals of a $(Ni_{0.5}Ct_{0.5})_7Nb_6$ alloy have been studied with a high-resolution electron microscope. Crystals of the Friauf-Laves and μ phases were identified in the sample, which is in agreement with the X-ray powder pattern. Planar defects of different kinds were easily and frequently observed. The structural model of defects have been derived via chemical twinning and intergrowth operations. (9 refs.)

101723 Stacking fault constant in X-ray diffraction: a high-resolution experimental study. S.-S.Jiang, A.R.Lang (H.H. Wills Phys. Lab., Univ. of Bristol, Bristol, England).
Proc. R. Soc. London Ser. A (GB), vol.388, no.1795, p.249-71 (8 Aug. 1983).
Stacking fault fringe patterns and related dynamical diffraction effects have been studied by X-ray section topographs in the case of a fault about 1 mm^2 in area contained in an unusually perfect and almost dislocation-free type I a natural diamond cut and polished into a plate 1 mm thick. The fault, a growth accident, lay on an octahedral plane inclined to the local octahedral growth surface and was bounded by a pair of partial dislocations parallel to ⟨110⟩. Images of the fault were recorded with $AgK\alpha_1$, $MoK\alpha_1$ and $CuK\alpha_1$ radiations. Those obtained with $AgK\alpha_1$ and $MoK\alpha_1$ represented the low absorption case, and were compared with computer simulated images. In the case of moderately high absorption ($CuK\alpha_1$) both diffracted beam (K_g-beam) and direct beam (K_0-beam) section topographs were recorded. (35 refs.)

101724 Reexamination of β-alumina doped with chromium using photoacoustic spectroscopy. J.H.Kennedy, A.M.Schuler (Chem. Dept., Univ. of California, Santa Barbara, CA, USA), G.E.Cabaniss.
J. Solid State Chem. (USA), vol.48, no.3, p.439-45 (15 July 1983).
A previous publication (Kennedy and Akridge (1978)) presented evidence that supported the hypothesis that chromium-doped β-alumina was oxidized to Cr(IV) during air-sintering. This evidence included chemical reactions observed, magnetic susceptibility, and conductivity, but, in particular, the strongest supporting evidence came from absorption spectroscopy. However, the technique used, powder dispersed in a KBr pellet, was not conductive to high quality spectra. For this reason, a much more powerful technique for solid samples, photoacoustic spectroscopy, has been applied to chromium-doped β-alumina. Additional absorption peaks have been observed that now clearly show that chromium remains as Cr(III) in β-alumina. The other previous evidence has been reexamined and it too can be interpreted as resulting from the presence of chromium (III). (12 refs.)

101725 Gettering of impurities by incoherent light annealed porous silicon. V.E.Borisenko, A.M.Dorofeev (Minsk Radioengng. Inst., Minsk, USSR).
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.375-9
The application of electrochemically formed porous silicon to getter Cu and Au atoms in silicon crystals during incoherent light annealing for 4 to 20 sec is reported. Exposure light power density of 30 W/cm^2 was used to heat the samples up to 950°C. Improvement of lifetime related to Au and Cu gettering with porous silicon has been observed. Excess impurity interstitials and their enhanced diffusion are supposed to be responsible for the gettering effect. (15 refs.)

101726 Ion implantation of Si and Be in $Al_{0.48}In_{0.52}As$. A.N.M.Masum Choudhury, W.Rowe, K.Tabatabaie-Alavi, C.G.Fonstad, K.Alavi, A.Y.Cho (Dept. of Electrical Engng. & Computer Sci., MIT, Cambridge, MA, USA).
J. Appl. Phys. (USA), vol.54, no.8, p.4374-7 (Aug. 1983).
Electrical characterization of (Al,In)As ion implanted with Be and Si following low and high dose multiple energy implant schedules, and annealed between 740 and 815°C with a pyrolytic silicon dioxide cap is reported. Only very low activation of Be is achieved (<3%). Silicon activation is considerably higher (>40%) and increases with increasing anneal temperature. However, a high concentration *n*-type surface layer is found on samples annealed at 815°C. This surface layer is not found on similarly annealed samples which were not implanted, or which were implanted with phosphorus. (14 refs.)

101727 The influence of growth conditions on sulfur incorporation in GaAs grown by molecular beam epitaxy. F.A.Andrews, R.Heckingbottom, G.J.Davies (British Telecom Res. Labs., Martlesham Heath, Ipswich, England).
J. Appl. Phys. (USA), vol.54, no.8, p.4421-5 (Aug. 1983).
An electrochemical sulfur cell has been used as a source of donors for molecular beam epitaxy grown GaAs. The galvanic cell is Pt/Ag/AgI/Ag_2S/Pt. The electrical and optical properties of the films grown in the substrate temperature range 550-590°C are good. However, at substrate temperatures above 600°C the incorporation rate of sulfur is much reduced. The reduction in the incorporation rate is explained on the basis of the competing reactions (1) the incorporation of sulfur into the GaAs matrix and (2) the formation of volatile Ga_2S. A detailed discussion of the incorporation at elevated substrate temperatures and with varying As_4/Ga ratio is presented. It is also demonstrated that if the substrate temperature is reproducibly known then the electrochemical cell can be used to introduce intricate doping profiles into epitaxial GaAs. A hyperabrupt varactor diode has been fabricated as an example. (22 refs.)

101728 Zn incorporation in $Ga_{1-x}Al_x$ As grown by liquid phase epitaxy and its electrical properties. G.Vassilieff, B.Saint-Cricq (Lab. d'Automatique et d'Analyse des Systemes, CNRS, Toulouse, France).
J. Appl. Phys. (USA), vol.54, no.8, p.4581-5 (Aug. 1983).
Zn doped $Ga_{1-x}Al_xAs$ layers with different Al concentrations ($x=0.2$, 0.3, 0.6) have been grown by the conventional liquid phase epitaxy method (LPE). The Zn mole fraction in the liquid solution has been varied from 5×10^{-4} to 5×10^{-2} and the corresponding hole concentration in the solid has been studied using Hall measurements. The results are as follows: hole concentrations up to 10^{18} cm^{-3} are easily obtained for a high x of 0.6. The hole concentration in the solid varies according to the square root of the Zn mole fraction in liquid ($X_{Zn}{}^l$), and varies as $\beta \exp(-\alpha x)$ for a given $X_{Zn}{}^l$. A global relation has been derived which totally defines Zn incorporation in $Ga_{1-x}Al_xAs$ crystal. The acceptor activation energy has been calculated for different aluminum concentrations and has been found to vary between 15 meV for $x=0$ and 30 meV for $x=0.6$. These results have been compared with the results obtained from other dopants. (9 refs.)

101729 A new type of electron beam doping—anomalous sputtering, anomalous room-temperature diffusion. T.Wada (Dept. of Electrical Engng., Mie Univ., Tsu, Japan).
Oyo Buturi (Japan), vol.52, no.3, p.239-44 (March 1983). In Japanese.
Gives the principles, experimental data and future prospects of the high-energy electron-beam impurity doping technique invented by the author. The method can dope an impurity by irradiating electron beams onto the desired impurity wafer placed on a mirror-finished Si (or Ge) substrate. A 0.2-mm thick impurity sheet provides maximum doping efficiency. For a 0.5-mm thick substrate, doping can be done deeply to the rear face. This shows extraordinary diffusion at room temperature. The amount of doping increases with increasing thickness of the impurity sheet. (34 refs.) *K.B.*

101730 Iron-ion—implantation effects in MgO crystals. A.Perez (Dept. de Phys. des Materiaux, Univ. Claude Bernard Lyon I, Villeurbanne, France), G.Marest, B.D.Sawicka, J.A.Sawicki, T.Tyliszczak.
Phys. Rev. B (USA), vol.28, no.3, p.1227-38 (1 Aug. 1983).
Magnesium oxide crystals implanted with $^{57}Fe^+$ ions at doses ranging from 10^{15} to 10^{17} ions/cm^2 (ion energy, 70, 100, and 150 keV) were studied with the conversion-electron Mossbauer spectroscopy technique. Supplementary data were obtained using the techniques of Rutherford backscattering and channeling of α particles, optical absorption, electron microscopy, and electrical conductivity. It was found that implantation introduces iron in MgO in three charge states: Fe^{2+}, Fe^{3+}, and metallic precipitates (Fe^0) with the dominant role of Fe^{3+} at low doses, Fe^{2+} at medium doses, and metallic iron clusters at the highest doses. The phase created in a medium range of doses can be compared with the magnesio-wustite solid solution. The isochronal thermal annealings in air at temperatures between 300 and 700°C gradually cause the oxidation and the nucleation of highly dispersed spinel-like clusters and then, at about 800-900°C, the growth of magnesioferrite particles. In contrast, the heat treatment in vacuum converts all iron into well-diluted Fe^{2+} in MgO phase. The nature of point defects and their role in annealing processes are discussed on the basis of the optical absorption data. A good corresondence between the results of Mossbauer and channeling data is indicated. The effect of the insulator-conductor transition occurring under iron-ion implantation in MgO and observed by electrical conductivity measurements is explained in terms of the atomistic properties of implanted crystals under study. (35 refs.)

101731 Ion-implantation dense cascade data. K.B.Winterbon.
Report AECL-8054, Atomic Energy Canada Ltd., Chalk River, Ont. (April 1983), 58 pp.
A tabulation is given of data useful in estimating various aspects of ion-implantation cascades in the nuclear stopping regime, particularly with respect to nonlinearity of the cascade at high energy densities. The tabulation is restricted to self-ion implantation. Besides power-cross-section cascade dimensions, various material properties are included. Scaling of derived quantities with input data is noted, so one is not limited to the values assumed by the author. (14 refs.)

101732 Pulsed UV excimer laser doping of semiconductors. T.F.Deutsch (Lincoln Lab., MIT, Lexington, MA, USA).
Laser Diagnostics and Photochemical Processing for Semiconductor Devices. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.225-34
UV excimer lasers have been used to dope semiconductors by a one-step process in which the laser serves both to release dopant atoms from a parent molecule and to melt the surface, allowing incorporation of dopant atoms by liquid state diffusion. The technique has been used to dope Si, GaAs, and InP. Shallow junctions formed by the technique have been fabricated into efficient Si and GaAs solar cells. (21 refs.)

101733 Submicrometer-linewidth laser doping. J.Y.Tsao, D.J.Ehrlich (Lincoln Lab., MIT, Lexington, MA, USA).
Laser Diagnostics and Photochemical Processing for Semiconductor Devices. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.235-42
Dopant patterns of 250-nm linewidth have been written in silicon by localized heating with a CW laser beam, and then transferred into positive and negative surface-relief patterns by preferential etching. The tightly focused beam both generates free dopant atoms and simultaneously promotes solid-state diffusion into the substrate. Because of the nonlinear dependence of diffusion rates on temperature, the linewidths of the patterns are substantially narrower than those of both the temperature and the laser-beam profiles on the surface. In addition, an enhancement is observed in diffusion rates under the strong thermal gradients associated with highly localized heating. (18 refs.)

101734 Characteristics of laser implantation doping. K.G.Ibbs, M.L.Lloyd (Hirst Res. Centre, GEC plc, Wembley, England).
Laser Diagnostics and Photochemical Processing for Semiconductor Devices. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.243-8
UV laser photochemical dissociation and laser enhanced thermal dissociation have been used to generate free metal dopant species from a variety of organometallic molecules near a semiconductor substrate surface. Simultaneous laser annealing via a localised melt phase allows diffusion driven implantation of the metal atoms and subsequent electrical activation in the regrowing material. High levels of dopant concentration and activation are readily achieved in this way. Results are presented on doping of silicon by boron using an ArF laser. Data are given on junction depths, number density and carrier density as a function of depth and interpretation of the data in terms of calculated temperature profiles. The possibility of tailoring junction characteristics by control of laser and gas flow parameters is considered with preliminary experimental data. (11 refs.)

101735 Dopant incorporation during rapid solidification. C.W.White, D.M.Zehner, J.Narayan, O.W.Holland, B.R.Appleton (Solid State Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA), S.R.Wilson.
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.287-96
Incorporation of Group III, IV, V dopants in silicon occurs as a result of solute trapping during laser annealing. Distribution coefficients and substitutional solubilities are far greater than equilibrium values, and can be functions of growth velocity and crystal orientation. Mechanisms limiting dopant incorporation at high concentrations are identified and discussed. (22 refs.)

101736 Flame annealing of ion implanted silicon. J.Narayan, R.T.Young (Solid State Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.361-7
The authors have investigated flame annealing of ion implantation damage (consisting of amorphous layers and dislocation loops) in (100) and (111) silicon substrates. The temperature of a hydrogen flame was varied from 1050 to 1200°C and the interaction time from 5 to 10 seconds. Detailed TEM results showed that a 'defect-free' annealing of amorphous layers by solid-phase-epitaxial growth could be achieved up to a certain concentration. However, dislocation loops in the region below the amorphous layer exhibited coarsening, i.e. the average loop size increased while the number density of loops decreased. Above a critical loop density, which was found to be a function of ion implantation variables and substrate temperature, formations of 90° dislocations (a cross-grid of dislocation in (100) and a triangular grid in (111) specimens) were observed. Electrical (Van der Pauw) measurements indicated nearly a complete electrical activation of dopants with mobility comparable to pulsed laser annealed specimens. The characteristics of p-n junction diodes showed a good diode perfection factor of 1.20-1.25 and low reverse bias currents. (9 refs.)

101737 Oxygen-induced recombination centers in as-grown Czochralski silicon crystals. K.Nauka, H.C.Gatos, J.Lagowski (MIT, Cambridge, MA, USA).
Appl. Phys. Lett. (USA), vol.43, no.3, p.241-3 (1 Aug. 1983).
Simultaneous quantitative microprofiles of the interstitial oxygen concentration and of the excess carrier lifetime were obtained, for the first time, in Czochralski-grown Si crystals employing double laser absorption scanning. It was found that oxygen concentration maxima and minima along the crystal growth direction coincide with lifetime minima and maxima, respectively. It was further found that the magnitude of oxygen-induced lifetime changes increases dramatically in going from the center to the periphery of the crystal. The present findings imply that 'as-grown' oxygen precipitates are involved in lifetime limiting processes. (11 refs.)

101738 Profile estimation of an implanted-diffused arsenic layer in silicon. Way-Seen Wang, Huai-Ying Meng (Dept. of Electrical Engng., Nat. Taiwan Univ., Taipei, Taiwan).
J. Appl. Phys. (USA), vol.54, no.8, p.4671-3 (Aug. 1983).
The nonlinear diffusion coefficients of a solid-state diffusion equation is approximated by a linear function of concentration, and then the resulting diffusion equation is solved exactly by the method of self-similar solution to obtain a simple expression for the profile estimation of an implanted-diffused arsenic layer in silicon. This expression is dependent only upon the total implant dose and the initial junction depth, but not the specific form of the initial profile. However, as the diffusion time is long enough, only the total implant dose is of significance. The approximate profile, junction depth, surface concentration, and sheet resistance agree quite well with those obtained by solving the nonlinear diffusion equation numerically or by carrying out the diffusion experimentally. (15 refs.)

101739 Impurity compensation in $\mathrm{Ga}_{1-x}\mathrm{Al}_x\mathrm{As}$ alloys. A.K.Saxena, B.B.Singh (Dept. of Electronics & Communication Engng., Univ. of Roorkee, Roorkee, India).
Phys. Rev. B (USA), vol.28, no.2, p.1132-3 (15 July 1983).
The results obtained from the temperature dependence $(80 \lesssim T \lesssim 750\mathrm{K})$ of the Hall electron concentration have been interpreted to derive the variation of the impurity compensation ratio in $\mathrm{Ga}_{1-x}\mathrm{Al}_x\mathrm{As}$ alloys $(0 \leq x \leq 0.78)$ as a function of alloy composition. It is found that the maximum value of this ratio is ~ 3.0 at $x \simeq 0.4$, which decreases for values of x on either side of $x \simeq 0.4$. (12 refs.)

101740 Ising model simulations of impurity trapping in silicon. G.H.Gilmer (Bell Labs., Murray Hill, NJ, USA).
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.249-61
Laser annealing experiments on silicon have shown that rapid solidification can trap large amounts of certain impurities in the crystal lattice. Concentrations that exceed the equilibrium solubility limits by several orders of magnitude have been obtained. In this paper the authors discuss the impurity trapping process using Monte Carlo simulation data from the kinetic Ising model. The dependence of the impurity concentration in the crystal on the solidification rate is calculated. The simulation data are compared with recent laser annealing results for bismuth and indium. Excellent agreement between the model and the bismuth experiments is obtained. The larger trapping rate on the (111) relative to the (100) orientation is found to be caused by the slower crystallization kinetics on the (111) face. Similar results are obtained for indium, although the difference in trapping on the (111) and (100) faces is somewhat smaller in the model than in the experiment. (32 refs.)

101741 Impurity redistribution in ion implanted Si after picosecond Nd laser pulse irradiation. S.U.Campisano, P.Baeri, E.Rimini, G.Russo (Istituto di Fisicia, Catania, Italy), A.M.Malvezzi.
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.273-9
Impurity redistribution in Bi-implanted Si and in As-implanted Si has been investigated after irradiation with 25 ps Nd($\lambda = 1.06$ μm) laser pulse in the energy range 0.1-1.5 J/cm^2. Channeling effect in combination with 2.0 MeV He$^+$ backscattering in glancing detection has been used to characterize the epitaxial crystallization, the impurity location and its depth redistribution. The amorphous to single crystal transition occurs at an energy density of about 0.4 J/cm^2. Bi atoms are located after crystallization in substitutional lattice sites for the in depth part of the distribution. Part of the Bi atoms accumulated at the sample surface and the amount of segregation increases with the pulse energy density and depends on the substrate orientation. A computer model has also been developed to calculate several parameters of interest, as the melt threshold, the melt duration, the carrier temperature, etc., including a detailed description of the absorption and of the energy relaxation processes. The calculations indicate that the simple thermal description accounts quantitatively for the experimental data on melt duration and impurity segregation. (11 refs.)

101742 Impurity distribution profiles and surface disorder after laser induced diffusion. E.Forgarassy, R.Stuck, P.Siffert (CRN, Strasbourg, France), F.Broutet, J.C.Desoyer.
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.311-16
A model for laser induced diffusion is proposed, assuming the melting of a Si surface under pulsed laser irradiation and the diffusion, in the liquid phase of a thin film with impurities deposited according to the 'limited source' conditions. Depending on the thickness of the film, there results a dopant distribution profile with a surface disordered layer induced either by segregation effects or precipitation of the dopant in excess of the solubility limit achieved by laser annealing. Experimental results, obtained for a ruby laser irradiation of thin films of different impurities of group III and V, like antimony, bismuth, gallium and indium deposited on silicon substrates, are in good agreement with the model. Their effective segration coefficients have been deduced by fitting the experimental amount of dopant precipitated in the disordered surface layer with the numerical calculations. A cellular structure is seen on the surface. (17 refs.)

61.70Y Interaction between different crystal structure defects

101743 Impurity-vacancy dipoles in cadmium-doped silver bromide crystals. B.A.Devlin, J.Corish (Dept. of Chem., Univ. Coll., Dublin, Ireland).
Phys. Status Solidi a (Germany), vol.78, no.1, p.53-60 (16 July 1983).
Thermal depolarization for single crystals of silver bromide doped with cadmium is measured using improved data acquisition techniques. Two overlapping dipole reorientation peaks at 92.6 and 99.5K are analyzed by nonlinear least-squares fitting and the relaxation processes are found to have activation energies of 0.250 and 0.311 eV, respectively. The dependence of the dipole relaxation spectrum on the anneal temperature of the crystal is also investigated systematically and it is concluded that the lower temperature peak is due to nearest-neighbour cadmium-vacancy pairs. This conclusion is also based on theoretical calculations made using the lattice simulation methods in the HADES programme of the binding energies of such complexes and on the results of detailed analyses of ionic conductance data measured on the same crystal. The higher temperature peak is thought to be due to the relaxation of a larger complex. (13 refs.)

101744 Influence of the variation of the association energy on the equilibrium concentration of dipole aggregates in ionic crystals. G.Berg (Sektion Phys., Martin-Luther-Univ. Halle/Wittenberg, Halle, Germany), A.Pippel, F.Frohlich.
Phys. Status Solidi a (Germany), vol.78, no.1, p.77-83 (16 July 1983).
Association energies of dipoles and dipole aggregates calculated theoretically by different methods or determined experimentally by an analysis of kinetic processes of dipole aggregation show a wide scattering. But surprisingly the equilibrium concentration of these aggregates calculated by minimizing the free energy of the crystal and computed with these mentioned energies are lying in a very narrow range. It is shown, that this phenomenon can be attributed to the fact, that the absolute values of the energies are indeed very different, but that the energy differences per defect site are approximately equal comparing two data sets. Only additional deviations can influence the equilibrium concentrations. (11 refs.)

101745 The measurement of the trap binding energy by the thermal analysis technique. Gye-Won Hong, Jai-Young Lee (Korea Advanced Inst. of Sci. & Technol., Chongryang, Seoul, Korea).
Scr. Metall. (USA), vol.17, no.7, p.823-6 (July 1983).
The mechanism of hydrogen transport in iron and steel is very important in order to understand the problem of hydrogen embrittlement which is a serious problem in modern industry. The diffusion of hydrogen in iron and steel shows large abnormality and it is often thought to be caused by the trapping of hydrogen at the lattice defects existing in iron and steel. It is necessary to know the energy level of hydrogen around the trap site in order to understand the interaction between hydrogen and the trap site. The trap binding energy was obtained by modifying the thermal analysis method. The thermal analysis was done for normalized 0.49 carbon steel and the trap binding energy of ferrite-cementite interface was obtained. (16 refs.)

101746 Effect of X-irradiation on impurity-vacancy dipoles in lead and calcium-doped NaCl. J.M.Garcia, J.A.Hernandez, H.S.Murrieta, J.O.Rubio (Inst. de Fisica, Univ. Nacional Autonoma de Mexico, Mexico City, Mexico).
Solid State Commun. (USA), vol.47, no.7, p.515-18 (Aug. 1983).
The effects of the room temperature X-irradiation in calcium and lead-doped NaCl have been reinvestigated in order to get a deeper insight into the nature of the radiation induced halogen interstitial traps. Special attention has been paid to determine whether a correlation exists between the change in the concentration of Ca^{2+} (Pb^{2+})-cation vacancy dipoles and the color center formation. The results indicate that for both systems, the dipoles are the fundamental traps for the interstitial defects in agreement with the theoretical models recently developed for F-center formation in alkali halides doped with divalent impurities. This conclusion is, however, in disagreement with that reported by Ikeya et al. (1965, 1966) in a previous work on calcium-doped NaCl in which it was concluded that the isolated positive ion vacancies were the dominant traps for the halogen interstitial defects. (21 refs.)

101747 Uniformly valid asymptotic solutions of chemical rate equations for irradiation-produced point defects. R.E.Mickens (Univ. of Colorado, Boulder, Co, USA).
Acta Phys. Pol. A (Poland), vol.A64, no.1, p.59-67 (July 1983).
The author presents a perturbation technique for obtaining solutions to a pair of nonlinear coupled differential equations which model the behaviour of the kinetics of irradiation-produced interstitials and vacancies. The procedure eliminates secular terms at each stage of the calculation; consequently, the solutions are uniformly valid for $0 \leq t < \infty$. (6 refs.)

101748 Experimental determination of the energy dependence of defect production. K.L.Merkle, W.E.King (Argonne Nat. Lab., Argonne, IL, USA), A.C.Baily, K.Haga, M.Meshii.
J. Nucl. Mater. (Netherlands), vol.117, p.4-11 (July 1983). (Proceedings of the Symposium on Radiation Damage Analysis for Fusion Reactors, St. Louis, MO, USA, 25-28 Oct. 1982).
A knowledge of primary damage production as a function of recoil energy is essential for predicting defect production in radiation environments of practical interest. The damage function $\nu(T)$, i.e. the number of Frenkel pairs as a function of recoil energy, is determined for Cu from electron and ion damage-rate measurements. $\nu(T)$ shows a plateau at $\nu=0.54$ which extends up to $\sim 7T_{\mathrm{d}}^{\mathrm{min}}$. Therefore, simple damage models, such as the modified Kinchin-Pease expression, are strongly deficient, not only at high recoil energies where stimulated recombination in cascades reduces defect production but also in the single displacement regime. As a consequence, no simple relation between $T_{\mathrm{d}}^{\mathrm{min}}$ and $T_{\mathrm{d}}^{\mathrm{av}}$ is expected to exist. A procedure is suggested which uses anisotropy measurements in combination with polycrystal electron and ion irradiations to construct absolute damage functions in metals. (30 refs.)

101749 Molecular dynamics simulation of low energy displacement cascades in Cu. W.E.King, R.Benedek (Materials Sci. & Technol. Div., Argonne Nat. Lab., Argonne, IL, USA).
J. Nucl. Mater. (Netherlands), vol.117, p.26-35 (July 1983). (Proceedings of the Symposium on Radiation Damage Analysis for Fusion Reactors, St. Louis, MO, USA, 25-28 Oct. 1982).
Molecular dynamics computer simulations have been performed to study properties of low-energy (<500 eV) displacement cascades in Cu. Various aspects of the time development of cascades are considered including instantaneous number of Frenkel pairs, partitioning of kinetic and potential energies, distribution of atom kinetic energies, cascade expansion rate, and Frenkel pair distributions. The anisotropy of the threshold energy for Frenkel pair production is interpreted in terms of 'branching'. Replacement sequences and the damage function are discussed based on analysis of events corresponding to 18 recoil directions. The damage function exhibits a plateau at $\nu \sim 0.5$ Frenkel pairs extending from 25-150 eV; at higher recoil energies the onset of multiple defect production is much slower than predicted by the modified Kinchin-Pease model. (23 refs.)

101750 Computer simulation of defect behavior under fusion irradiation environments. T.Muroga, S.Ishino (Dept. of Nuclear Engng., Univ. of Tokyo, Tokyo, Japan).
J. Nucl. Mater. (Netherlands), vol.117, p.36-45 (July 1983). (Proceedings of the Symposium on Radiation Damage Analysis for Fusion Reactors, St. Louis, MO, USA, 25-28 Oct. 1982).
To simulate defect behavior under irradiation, three kinds of cascade-annealing calculations have been carried out in alpha-iron using the codes MARLOWE, DAIQUIRI and their modifications. They are (1) cascade-annealing calculation with different masses of projectile, (2) defect drifting near dislocations after cascade production and (3) cascade-overlap calculation. The defect survival ratio is found to increase as decreasing mass of the projectile both after athermal close-pair recombination and after thermal annealing. It is shown that at moderate temperatures vacancy clustering is enhanced near dislocations. Cascade-overlap is found to decrease the defect survivability. In addition, the role of helium in vacancy clustering has been calculated in aluminum lattices and its effect is found to depend strongly on temperature, interstitials and the mobility of small clusters. These results correspond well to the experimental data and will be helpful for correlating between fusion and simulation irradiations. (27 refs.)

101751 Defect production in simulated cascades: cascade quenching and short-term annealing. H.L.Heinisch (Hanford Engng. Dev. Lab., Richland, WA, USA).
J. Nucl. Mater. (Netherlands), vol.117, p.46-54 (July 1983). (Proceedings of the Symposium on Radiation Damage Analysis for Fusion Reactors, St. Louis, MO, USA, 25-28 Oct. 1982).
Defect production in displacement cascades in copper has been modeled using the MARLOWE code to generate cascades and the stochastic annealing code ALSOME to simulate cascade quenching and short-term annealing of isolated cascades. Quenching is accomplished by using exaggerated values for defect mobilities and for critical reaction distances in ALSOME for a very short time. The quenched cascades are then short-term annealed with normal parameter values. The quenching parameter values were empirically determined by comparison with results of resistivity measurements. Throughout the collisional, quenching and short-term annealing phases of cascade development, the high energy cascades continue to behave as a collection of independent lower energy lobes. For recoils above about 30 keV the total number of defects and the numbers of free defects scale with the damage energy. As the energy decreases from 30 keV, defect production varies with the changing nature of the cascade configuration, resulting in more defects per unit damage energy. The simulated annealing of a low fluence of interacting cascades revealed an interstitial shielding effect on depleted zones during Stage I recovery. (14 refs.)

101752 Precipitate dissolution by high energy collision cascades. P.Chou, N.M.Ghoniem (School of Engng. & Appl. Sci., Univ. of California, Los Angeles, CA, USA).
J. Nucl. Mater. (Netherlands), vol.117, p.55-63 (July 1983). (Proceedings of the Symposium on Radiation Damage Analysis for Fusion Reactors, St. Louis, MO, USA, 25-28 Oct. 1982).
The evolution of the microstructures during irradiation is now widely recognized due to: (1) radiation altered kinetic phenomena; (2) collisional processes by energetic cascades. The authors investigate the specific nature of the collisional interaction between energetic cascades and precipitates. A new Monte Carlo-based computer program, TRIPOS, has been developed for the transport of ions in polyatomic solids. The computer code utilizes standard nuclear and electronic energy loss formulas, and compares well with experimental data on particle reflection, penetration and sputtering. One of the unique features of the code is its applicability to problems involving multispecie media in multilayers of 3-dimensional configurations. The interaction of neutron-initiated high energy collision cascades is demonstrated to result in the partial dissolution of precipitates. However, the maximum precipitate size that may be completely destroyed by a high energy collision cascade is only a small fraction of the cascade size. Matrix atom implantation inside precipitates as well as preferential sputtering of light atoms from the surface of precipitates into the matrix is demonstrated to lead to changes in precipitate stoichiometry. (19 refs.)

101753 Atomic displacement functions of cubic metals. P.Jung (Inst. fur Festkorperforschung, KFA Julich, Julich, Germany).
J. Nucl. Mater. (Netherlands), vol.117, p.70-7 (July 1983). (Proceedings of the Symposium on Radiation Damage Analysis for Fusion Reactors, St. Louis, MO, USA, 25-28 Oct. 1982).
Atomic displacement functions for various cubic transition metals are derived from electron, ion and neutron damage rate data. Damage rates under electron and light ion irradiation as well as the total number of defects produced during α-implantation are calculated over a wide range of energies from these displacement functions. General relations for displacement functions and displacement energies are given which may be used for other metals or alloys for which no experimental data are available. The results are suggested to find practical use for correlating material behaviour from simulation experiments to a fusion environment. (35 refs.)

101754 Quantitative modelling of swelling in M316 steel. R.Bullough, S.M.Murphy, T.M.Quigley, M.H.Wood (Theoretical Phys. Div., AERE, Harwell, Didcot, England).
J. Nucl. Mater. (Netherlands), vol.117, p.78-88 (July 1983). (Proceedings of the Symposium on Radiation Damage Analysis for Fusion Reactors, St. Louis, MO, USA, 25-28 Oct. 1982).
The chemical rate theory is widely used to describe the microstructural evolution in a material during irradiation. The authors describe recent improvements to the theory that increase its predictive capability. The incubation dose prior to the onset of void swelling is modelled by allowing partition of the gas between the various sinks in the microstructure. New dislocation and void sink strengths have been derived incorporating the field effects. These improvements to the theory have been incorporated into a new FACSIMILE computer code designated VS5. The new code has been successfully employed to model void swelling during HVM, VEC and fast reactor irradiation of 316 steel. (15 refs.)

101755 Helium partitioning between voids and dislocations. B.O.Hall (Materials Sci. Div., Westinghouse Res. & Dev. Center, Pittsburgh, PA, USA).
J. Nucl. Mater. (Netherlands), vol.117, p.89-95 (July 1983). (Proceedings of the Symposium on Radiation Damage Analysis for Fusion Reactors, St. Louis, MO, USA, 25-28 Oct. 1982).
A model that describes the interaction of mobile helium with void and interstitial-loop distributions in irradiated metals has been developed. Both evolving loops and voids are assumed to provide saturable and reversible trap sites for interstitial helium and detrapping by thermal emission and by irradiation displacement is included. To avoid the computational limitations of standard rate-theory methods, differential equations have been derived for the moments of the cavity and loop distributions in the two-dimensional size spaces that include both point defect and helium number. Equations for the first and second moments are included in the partitioning model, along with the necessary mobile defect equations. The time dependence of the mean cavity size and gas content and the mean loop size and trap occupation number have been obtained in closed form for simplified conditions as an illustration. (15 refs.)

101756 Theory of helium transport and clustering in materials under irradiation. N.M.Ghoniem (School of Engng. & Appl. Sci., Univ. of California, Los Angeles, CA, USA), S.Sharafat, J.M.Williams, L.K.Mansur.
J. Nucl. Mater. (Netherlands), vol.117, p.96-105 (July 1983). (Proceedings of the Symposium on Radiation Damage Analysis for Fusion Reactors, St. Louis, MO, USA, 25-28 Oct. 1982).
A theoretical model is developed to describe helium transport and clustering during irradiation. Diffusional reactions of helium with vacancies and vacancy clusters, with extended sinks for helium absorption, and direct reactions with displacement producing particles are included. The full description developed is employed in numerical computations. A simpler description is also developed in the limits where certain reactions are unimportant. Analytical expressions for the effective diffusion coefficient of helium are derived. Regimes of the parameter space of dose rate, temperature, helium generation rate, sink strength and other important conditions, where the effective diffusion coefficient is dictated by three different physical processes, are defined. The result is determined by the dominant release mechanism of helium bound in vacancies-thermal detrapping, replacement by the self-interstitial or direct displacement. Results from the full computations and the analytical expressions are compared. (28 refs.)

101757 Theory of pulsed irradiation microstructures. E.P.Simonen (Pacific Northwest Lab., Richland, WA, USA).
J. Nucl. Mater. (Netherlands), vol.117, p.113-17 (July 1983). (Proceedings of the Symposium on Radiation Damage Analysis for Fusion Reactors, St. Louis, MO, USA, 25-28 Oct. 1982).
Flux pulsing is predicted to influence microstructures because of pulse annealing effects on aggregate annealing and on point defect annealing. Specifically void annealing and vacancy annealing are analyzed. A high dislocation density enhances the void annealing effect but inhibits the point defect annealing effect. Furthermore, pulsing effects are greater for higher damage rates and smaller defect aggregates. It is concluded that pulsed ion irradiations can simulate pulsed fusion irradiations if it is recognized that the ions exaggerate the expected neutron effect. (7 refs.)

101758 The growth of gas-bubbles by coalescence in solids during continuous gas generation. D.Preininger, D.Kaletta (Inst. fur Material- und Festkorperforschung II, Kernforschungszentrum Karlsruhe, Karlsruhe, Germany).
J. Nucl. Mater. (Netherlands), vol.117, p.239-43 (July 1983). (Proceedings of the Symposium on Radiation Damage Analysis for Fusion Reactors, St. Louis, MO, USA, 25-28 Oct. 1982).
In order to get some insight into the mode of gas bubble growth during the high temperature irradiation of solids, the authors have calculated the distributions of bubbles grown by coalescence. The calculations are based on Gruber's coalescence model for annealing which have been extended to the case of an irradiation induced gas generation. The dominant assumption is that the continuously generated inert gas atoms go into new bubbles distributed around small radii. The results show that the bubble growth rate is markedly increased by the irradiation induced gas generation and that the calculated bubble distribution profile exhibits a double peak as often observed experimentally. (23 refs.)

101759 Rapid thermal annealing of silicon using an ultrahigh power arc lamp. R.T.Hodgson, J.E.E.Baglin, A.E.Michel (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA), S.Mader, J.C.Gelpey.
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.355-60
The authors have used an ultrahigh power, 100 kW vortex cooled arc lamp to anneal As^+ implant damage in ⟨100⟩ silicon wafers. When the wafer temperature was held above 1100°C for ~1 sec, TEM analysis indicated that the material was free of extended defects. The dopant diffused much more rapidly than would be expected from the usual models. However, preliminary results indicate that defect free material can be produced with dopant movement limited to ~100 Å. (9 refs.)

101760 Isothermal annealing of ion implanted silicon with a graphite radiation source. S.R.Wilson, R.B.Gregory, W.M.Paulson (SRDL, Motorola Inc., Phoenix, AZ, USA), A.H.Hamdi, F.D.McDaniel.
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.369-74
Both (100) and (111) Si wafers were implanted with As, P or B to doses from 10^{13} to $10^{16}/cm^2$ and annealed with a Varian IA-200 isothermal annealer. The anneal occurs in a vacuum using infrared radiation for exposure times of 5 to 30 sec. Sheet resistance (R_s), Hall effect, RBS and SIMS were used to analyze the wafers. For each dopant a decreasing R_s occurs with increasing exposure time until a minimum value is reached. Longer anneals produce increased dopant diffusion, and the R_s for As and P implanted wafers increased unless the wafer was capped with 0.05 μm of SiO_2 which prevents a loss of dopant. The results for (100) wafers are better than for (111) with As doses $\leq 10^{15}/cm^2$ however, at doses $>10^{15}/cm^2$ and the (100) and (111) results are comparable. The As implanted, isothermally annealed layers were thermally stable for As concentrations $\leq$2E 20/cm^3. (15 refs.)

101761 Regimes of laser-induced periodic surface structure on germanium: radiation remnants and surface plasmons. J.F.Young, J.E.Sipe, H.M.van Driel (Dept. of Phys., Univ. of Toronto, Toronto, Ontario, Canada).
Opt. Lett. (USA), vol.8, no.8, p.431-3 (Aug. 1983).
The authors' present experimental evidence showing that the period of the rippled surface structure induced on germanium by 1.06 μm laser pulses undergoes a discontinuous shift above a certain threshold intensity. The measured shift, as a function of the angle of incidence of the damaging beam is quantitatively interpreted as a transition between a regime of inhomogeneous melting controlled by radiation-remnant field structures and a regime of ripple formation involving surface plasmons in an optically thick layer of liquid, metallic germanium formed at the surface. (16 refs.)

101762 Deposition of laser energy into inhomogeneous layer systems. H.-D.Geiler, K.Hehl, D.Stock (Sektion Phys., Friedrich-Schiller-Univ. Jena, Jena, Germany).
Phys. Status Solidi a (Germany), vol.78, no.1, p.193-9 (16 July 1983).
A model of the primary energy deposition during laser annealing in layer systems is developed based on the calculation of the divergence of the Poynting vector and taking into account the superposition of the field amplitudes inside each layer. The energy deposition function is calculated for the following model systems: amorphous on crystalline silicon, polycrystalline Si/SiO_2 crystalline Si, and molten Si amorphous Si/crystalline Si. The influence of the interference effect on the total reflectivity, the energy deposition, and the transmission is discussed with reference to the dependence on the thicknesses of the layers. (11 refs.)

101763 Incorporation of Sb in Si during CW laser stimulated solid phase epitaxy. H.Hedler, G.Gotz (Sektion Phys., Friedrich-Schiller-Univ. Jena, Jena, Germany).
Phys. Status Solidi a (Germany), vol.78, no.1, p.237-41 (16 July 1983).
The determination of the temporal temperature distribution shows that CW laser annealing is a multi-pulse process. It can divided into three stages: the preannealing stage, the recrystallization stage and the postannealing stage. The first two stages determine the nucleation and the recrystallization behaviour during irradiation. After ion implantation of 6×10^{15} Sb/cm^2 in ⟨100⟩ Si and CW laser stimulated recrystallization a partial incorporation of impurities on lattice sites depending on the duration of the preannealing stage and on the effective annealing temperature is observed. A linear connection is found between the substantial Sb part and the effective annealing temperature. (9 refs.)

101764 Using optical fibers in laser processing. L.D.Laude, L.Baufay, A.Pigeolet (Faculte des Sci., Univ. de l'Etat, Mons, Belgium).
Laser Diagnostics and Photochemical Processing for Semiconductor Devices. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.249-53
Phase transformations occurring upon CW laser irradiating through optical fiber polymetallic, multilayered films deposited on insulating substrates is shown to provide a simple and versatile way to optically micro-print predetermined patterns. The technique allows both further reduction to the Rayleigh limit and simultaneous multiplication of the patterns. (3 refs.)

101765 Picosecond time-resolved detection of plasma formation and phase transitions in silicon. J.M.Liu, H.Kurz, N.Bloembergen (Div. of Appl. Sci., Harvard Univ., Cambridge, MA, USA).
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.3-12
Picosecond time-resolved reflectivity and transmission changes of bulk silicon and silicon-on-sapphire have been measured to study the electron-hole plasma formation and phase transitions in silicon, induced by picosecond green of ultraviolet pulses. The results provide direct evidence of ultrafast energy transfer to the lattice and ultrafast phase transitions in silicon. Lattice heating up to the melting point and overheat of the melt or boiling have been observed during the picosecond pulse duration. (17 refs.)

101766 Femtosecond time resolved reflectivity of optically excited silicon. R.Yen, C.V.Shank, C.Hirlimann (Bell Telephone Labs., Holmdelm, NJ, USA).
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.13-16
The authors report measurements of the time resolved reflectivity of silicon following excitation with an intense 90 femtosecond optical pulse. These measurements clearly time resolve the process of energy transfer from the optically excited electron-hole plasma to the crystal lattice and subsequent melting within the first few picoseconds. (8 refs.)

101767 Raman scattering with nanosecond resolution during pulsed laser heating of silicon. D.von der Linde, G.Wartmann, A.Ozols (Fachbereich Phys., Univ. Essen-GHS, Essen, Germany).
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.17-22
The authors present time-resolved measurements of spontaneous anti-Stokes and Stokes Raman scattering during pulsed laser heating of crystalline silicon. The time-evolution of the lattice temperature is determined from the measured anti-Stokes/Stokes intensity ratio. In a separate calibration experiment they measure the temperature dependence of the anti-Stokes/Stokes ratio of an oven-heated silicon crystal from 300K up to 900K. The phase transition occurring during laser heating is detected by monitoring the changes of the optical reflectivity during laser irradiation. The data suggest that the phase transition occurs at a lattice temperature of ~600K. (7 refs.)

101768 Pulsed Raman measurements of phonon populations: time reversal, correction factors, and all that. A.Compaan (Max-Planck-Inst. fur Festkorperforschung, Stuttgart, Germany), H.W.Lo, A.Aydinli, M.C.Lee.
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.23-33
Transient optic phonon populations are measured in crystalline Si as a function of 532 nm laser energy density. The use of a continuously tunable pulsed dye laser as the Raman probe allows one to obtain, under exact experimental conditions, all correction factors necessary to extract the phonon population without the necessity of relying on room temperature or oven-heated conditions. The authors find the shift of the 520 cm^{-1} Raman-line to be consistent with the observed Stokes/anti-Stokes ratios indicating a maximum optic phonon temperature of 450±100°C. A discussion is also given of the errors in several recent criticisms of the Raman results. (25 refs.)

101769 A detailed examination of time-resolved pulsed Raman temperature measurements of laser annealed silicon. G.E.Jellison,Jr., D.H.Lowndes, R.F.Wood (Solid State Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.35-40
Raman temperature measurements during pulsed laser annealing of Si by Compaan and co-workers (1980) are critically examined. It has been shown previously that the Stokes to anti-Stokes ratio depends critically upon the optical properties of silicon as a function of temperature. These dependences, coupled with the large spatial and temporal temperature gradients normally found immediately after the high reflectivity phase, result in large variations in the calculated temperature depending upon the probe laser pulse width and the pulse-to-pulse and spatial variations in the annealing pulse energy density. (9 refs.)

101770 Instability of the electron-hole plasma and its possible relation with melting. M.Combescot, J.Bok (Groupe de Phys. des Solides, Ecole Normale Superieure, Paris, France).
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.41-2
The authors show that the softening of the TA phonon mode produces an instability in the electron-hole plasma of a silicon-like semiconductor and suggest that this instability can be the mechanism for melting of this type of material. This allows one to estimate the characteristics of a laser pulse which are necessary to modify the usual melting, i.e. which would lead to a substantial decrease of the melting temperature. (4 refs.)

101771 Time-resolved study of silicon during pulsed-laser annealing. B.C.Larson, C.W.White, T.S.Noggle, J.F.Barhorst (Solid State Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.43-50
Near surface temperatures and temperature gradients have been studied in silicon during pulsed laser annealing. The investigation was carried out using nanosecond resolution X-ray diffraction measurements made at the Cornell High Energy Synchrotron Source. Thermal-induced-strain analyses of these real-time, extended Bragg scattering measurements have shown that the lattice temperature reached the melting point during 15 ns, 1.1-1.5 J/cm^2 ruby laser pulses and that the temperature of the liquid-solid interface remained at that temperature throughout the high reflectivity phase, after which time the surface temperature subsided rapidly. The temperature gradients below the liquid-solid interface were found to be in the range of 10^7°C/cm. (8 refs.)

101772 Measurement of fast melting and regrowth velocities in picosecond laser heated silicon. P.H.Bucksbaum, J.Bokor (Bell Telephone Labs., Holmdel, NJ, USA).
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.51-6
Fast regrowth of amorphous silicon from liquid silicon films has been directly observed in a time resolved picosecond laser melting experiment. Liquid films up to 100 nm thick were formed on crystalline substrates with 15 picosecond 248 nm pulses from a KrF* excimer laser. The film thickness as a function of time was probed directly by observing attenuation of 1.64 μm 15 psec light pulses transmitted through the melt. Melting and regrowth velocities were compared to a heat diffusion model, and evidence for melt undercooling was observed. The resolidified silicon was amorphous at all values of incident laser intensity. (8 refs.)

101773 Time resolved measurements of interface dynamics during pulsed laser melting observed by transient conductance. M.O.Thompson, G.J.Galvin (Dept. of Material Sci., Cornell Univ., Ithaca, NY, USA).
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.57-67
The transient conductance technique has been used in a detailed study of the liquid-solid interface dynamics during pulsed laser melting of Si and silicon-on-sapphire. Average melt and regrowth velocities, as well as the maximum melt depth, can be obtained with the technique. The measurements are found to agree well with a computer simulation based on a thermal model of the melt and subsequent solidification. The melt-in velocity has been observed to exceed 200 m/sec. Under 2.5 ns UV irradiation, the critical velocity for amorphization of <100> Si has been measured at 15 m/sec. (24 refs.)

101774 Ultra-high speed solidification and crystal growth in transiently molten semiconductor layers. A.G.Cullis (Royal Signals & Radar Establ., Malvern, England).
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.75-82
The use of Q-switched laser melting techniques to investigate new rapid solidification phenomena is described. It has been found that Si, Ge, GaP and GaAs can give rise to orientation-dependent, kinetically-controlled defect generation processes during fast recrystallization from the melt. Indeed, these materials yield amorphous phases at sufficiently high solidification rates. Ultra-fast pulsed melting permits the study of the basic thermodynamic properties of amorphous solids. It is shown that amorphous Si melts to give a normal, low viscosity, undercooled liquid and that novel explosive crystal growth processes can occur in this low temperature regime. (18 refs.)

101775 Amorphous phase trapping as a result of pulsed laser irradiation of silicon. R.F.Wood (Solid State Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.83-8
It is concluded that large interface undercoolings of ~300 deg are not likely to occur during pulsed laser annealing and that the observed liquid to amorphous phase transition is not a purely thermodynamic effect. It is then shown that the formation of the amorphous phase can be understood on the basis of a kinetic rate model which makes large undercoolings of the interface unnecessary. (15 refs.)

101776 Nonlinear laser melting of indium antimonide and silicon. M.P.Hasselbeck, H.S.Kwok (Dept. of Electrical & Computer Engng., State Univ. of New York, Amherst, NY, USA).
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.97-104
Pulsed 10.6 μm TEA CO_2 laser light has been used to melt the semiconductors silicon and InSb. Measurements indicate that generation of free carriers necessary for melting may take place by nonlinear processes such as two-phonon absorption or intraband avalanche ionization. If the semiconductor is sufficiently doped, melting may also result from linear free carrier absorption. In all cases, it appears that the molten depth exceeds several μm, which is much greater than obtained with lasers of shorter wavelength. (6 refs.)

101777 Thermodiffusion—a new approach to plasma self-confinement. A.Forchel, B.Laurich (Phys. Inst., Univ. Stuttgart, Stuttgart, Germany), G.Mahler.
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.105-10
From a model for the thermodiffusion of high density plasma an electronic mechanism for plasma self-confinement is derived. Due to the increase of the confinement densities with the density of states masses this effect should be most important in laser annealing experiments in Si but much weaker in GaAs. A fast diffusion of the surface generated plasma is found to enhance the impact ionization rate. (8 refs.)

101778 Temperature characterization of pulsed laser annealing of semiconductors. D.L.Kwong, D.M.Kim (Dept. of Electrical Engng., Univ. of Notre Dame, Notre Dame, IN, USA).
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.111-16
The dynamic characteristics of lattice temperature, T attained in Si under the influence of a high power laser beam irradiation are examined analytically over a wide range of laser wavelengths, pulse intensities and durations. The strongly temperature-dependent material parameters, such as optical absorption coefficient $\alpha(T)$ and thermal diffusivity $D(T)$ are incorporated in heat diffusion equation, and their nonlinear coupling effect on the ensuing temperature in laser-processed semiconductors are examined. Specifically, the threshold pulse energy for surface melting is characterized as a function of both material and annealing laser beam parameters. This analytic description of pulsed laser heating of semiconductors should provide considerable insight into the transient heating phenomena and localized material modifications. (10 refs.)

101779 Substrate latent heat effects in the calculations for pulsed laser irradiated thin films. J.J.Cao, K.Rose (Center for Integrated Electronics, Rensselaer Polytech. Inst., Troy, NY, USA), O.Aina, W.Katz, J.Norton.
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.117-22
The authors present a numerical model for the calculation of the temperature rise caused by pulsed laser irradiation of a thin film/substrate structure. This model included phase changes in both the thin film and the substrate. The inclusion of phase changes results in more complex thermal behaviour and significantly affects melt durations. This model was applied to the AuGe/GaAs system. Morphological observation using the scanning electron microscope and SIMS profiles provides experimental verification for the numerical calculations. (7 refs.)

101780 Laser induced temperature rise in semiconductors: analytical solutions, application to the transient. A.Maruani, Y.I.Nissim, F.Bonnouvrier, D.Paquet (CNET, Bagneux, France).
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.123-8
It is shown how the systematic use of the method of integral transforms greatly simplifies the calculation of the temperature rises in laser irradiated media. In general, this method leads ultimately either to analytical results or to very simple numerical integrals (e.g. no poles, exponential kernels). The authors focus on the analytical results, and discuss some aspects of CW laser heating, for large surface absorption, including radial dependence, depth dependence and transient nonlinearities. The new results derived in this treatment are in good agreement with experimental data from other studies. (6 refs.)

101781 Visualization of temperature profiles in a-Si crystallized in the explosive mode by CW laser. M.Rivier, A.Cserhati, G.Goetz (Bendix Advanced Technol. Center, Columbia, MD, USA).
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.185-9
The authors present an experimental method, based on the isothermal nature of the boundaries of explosively crystallized silicon, to display instantaneous isotherms produced by fast scanning laser beams. This method is especially useful for the case of multilayer structures or complex geometries, where thermal profiles simulation is a difficult problem. The authors can also obtain directly a measure of the spatial intensity distribution in the laser beam. (12 refs.)

101782 Surface electromagnetic waves in laser material interactions. D.J.Ehrlich, S.R.J.Brueck, J.Y.Tsao (Lincoln Lab., MIT, Lexington, MA, USA).
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.191-6
Transient ripple formation in pulsed laser annealing of semiconductor materials is shown to arise from amplified surface polariton scattering. The permanent ripple patterns are frozen in after transverse thermal and material diffusion during the laser-annealing process. The model is in good agreement with time-resolved measurements of the ripple formation in 1.06-μm laser anealing of Ge. Dispersion of the ripple wavevector in the UV spectral region is discussed. (12 refs.)

101783 Laser induced periodic surface structure. H.M.Van Driel, J.F.Young, J.E.Sipe (Dept. of Phys., Erindale College, Univ. of Toronto, Toronto, Ontario, Canada).
Laser-Solid Interactions and -Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.197-204
Laser induced periodic surface structure can be understood as a universal phenomenon which occurs when high intensity pulses are absorbed near the surface of solids or liquids. The phenomenon occurs on metals, semiconductors and insulators because of the interference between the incident pulse and an induced 'radiation remnant'. This scattered field may be enhanced by the existence of true surface modes such as surface plasmons or phonon-polaritons, but this is not essential. The universality characteristics include beam polarization, since they show that circularly polarized light can induce surface ripples, with the damage structure showing a dependence on the sense of rotation. They also present time resolved results of the formation of the ripples to illustrate the essential dynamical processes that occur. (23 refs.)

101784 Picosecond laser-induced surface transformations in solids. P.M.Fauchet, Z.Guosheng, A.E.Siegman (Edward L. Ginzton Lab., Stanford Univ., Stanford, CA, USA).
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.205-10
The authors report the results of a study of surface transformations in semiconductors (Si, GaAs) and metals (Cu) produced by 100 ps long pulses from a Nd:YAG laser system. They present and outline the conclusions of their model for growth of spontaneous periodic surface structures or ripples often associated with laser damage and annealing. The effect of repetitive subthreshold illumination is also examined. Theoretical analysis is presented to support time-resolved experiments performed with two excitation pulses at different wavelengths. (15 refs.)

101785 Aligned, coexisting liquid and solid regions in pulsed and CW laser annealing of Si. R.J.Nemanich, D.K.Biegelsen, W.G.Hawkins (Xerox Palo Alto Res. Center, Palo Alto, CA, USA).
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.211-16
Aligned, coexisting liquid and solid regions are observed in CW laser annealing of polycrystalline Si films on quartz susbstrates. These stripe patterns are the precursors of surface topography that exists after cooling. It is proposed that a similar situation exists in the pulse annealing process. A calculation of the temperature evolution which assumes stripe symmetry and kinetic restraints of the crystallization process has been carried out. The calculations indicate a lattice temperature of between 1100 and 1300K, 10 nsec after the sample has fully solidified. (10 refs.)

101786 Interferometric measurements of surface properties during laser annealing. M.Bertolotti, A.Ferrari, C.Sibilia (Istituto di Fisica, Ingegneria, Univ. Roma, Rome, Italy).
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.217-20
A simple interferometric method is presented which allows measurement of small vertical displacement of a surface heated by a laser beam. Calculations applied to a silicon crystal in the case of a CW laser show reasonable agreement with experiment. The method can be applied to assess surface temperature and thermal constants. (2 refs.)

101787 Search for vacancies in laser annealed silicon. H.J.Stein, P.S.Peercy (Sandia Nat. Labs., Albuquerque, NM, USA).
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.229-34
In an effort to enhance vacancy trapping and detection in laser-annealed Si, float zone Si was implanted with oxygen to achieve concentrations between one and two orders of magnitude greater than the equilibrium saturation limit. Oxygen, which is known to be an effective trap for vacancies, was found to incorporate efficiently into Si regrown with Q-switched laser annealing. Interstitial oxygen, oxygen-vacancy defects and divacancies were observed after implantation. The laser-regrown layers, however, were free of detectable vacancy-associated defects. (12 refs.)

101788 Microprobe Raman analysis of picosecond laser annealing of implanted silicon. J.Sapriel, Y.I.Nissim, J.L.Oudar (CNET, Bagneux, France).
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.235-40
Picosecond laser annealing has been performed on implantation-amorphised silicon. A multiannular (up to five rings) recrystallization pattern has been generated by a single-30 psec pulse at 1.06 μm and 0.53 μm wavelength and energy density just below the damage threshold. The different patterns have been investigated by scanning the surface with a Raman microprobe with a 1 μm spacial resolution. Information is thus given on the different phases (amorphous or crystalline) and on lateral as well as in depth dimensions of the different rings. (9 refs.)

101789 Pulsed laser annealing of ion implanted Ge. O.W.Holland, J.Narayan, C.W.White, B.R.Appleton (Solid State Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.297-302
Ion backscattering/channeling and transmission electron microscopy (TEM) were used to investigate the annealing behavior of ion implanted Ge single crystals using a Q-switched ruby laser. The impurities studied where Bi, In, Sb and Pb, which were implanted at liquid nitrogen temperature into both (100) and (111) crystal orientations. A rather unique damage structure which can form during room temperature implantation of Ge is discussed. Maximum substitutional concentrations, which far exceed the retrograde maxima, are reported for all the dopants studied in (100)Ge. The maximum concentrations were limited by an interfacial instability during epitaxial growth following laser irradiation which led to the formation of a well-defined cellular structure. (14 refs.)

101790 Surface studies of laser annealed semiconductors. D.M.Zehner, C.W.White (Solid State Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.317-28
The surface regions of semiconductor single crystals have been examined following laser annealing in an ultrahigh vacuum environment with output of a pulsed ruby laser. Atomically clean surfaces with impurity levels below 0.1% of a monolayer can be produced by multiple pulse irradiation. Ordered surface structures are produced on low index oriented crystals as well as crystals slightly misoriented. Metastable surface structures exhibiting (1×1) LEED patterns have been produced on (111) orientations and are believed to be a consequence of the rapid cooling rates of 10^9 degs/sec achieved with the laser irradiation process. The surface and subsurface regions of ion-implanted Si crystals have been examined both before and after laser irradiation and results obtained from Si samples implanted with As are discussed. (17 refs.)

101791 Laser-induced surface defects. J.M.Moison, M.Bensoussan (Dept. OMT, CNET, Bagneux, France).
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.329-34
The influence of pulsed laser processing (PLP) on the structure and composition of Si, GaAs, InP and Au surfaces has been investigated as a function of the laser fluence. Above a threshold fluence, all initial structures turn into a (1×1) structure and the V-element content of the compound surfaces is decreased. The structure change is shown to be related to the existence of a number of atomic steps on the PLP surface (up to $10^{14}/cm^2$ equivalent broken bonds). These defects can be eliminated by further annealings. On the other hand, the stoichiometry defects, which are less numerous (10^{12}-$10^{13}/cm^2$) cannot be eliminated. A model for the mechanisms of defect creation and annihilation during PLP is outlined. The incidence of PLP-induced defects on device technology is evaluated. (14 refs.)

61.80C X-rays

101792 Irradiation effects in perovskite-type fluorides. N.Kristianpoller, B.Trieman (Dept. of Phys. & Astron., Tel Aviv Univ., Tel Aviv, Israel).
Radiat. Eff. (GB), vol.72, no.1-4, p.201-8 (1983). (Proceedings of the Fourth Europhysical Topical Conference on 'Lattice Defects in Ionic Crystals', Dublin, Ireland, 29 Aug.-3 Sept. 1982).
Nominally pure as well as variously doped ABF_3 crystals were irradiated by X-rays or by monochromatic UV radiation in the spectral region from 300 to 110 nm. It appears that some of the absorption bands, induced by the low energy radiation are due to the same defects as the electron induced bands at the same wavelengths; this is supported by the finding that the related bands decay in both cases in a similar way. Correlations were also found between the spectral composition of the TL emitted during thermal annealing of certain radiation defects and the emission bands of the *X*-luminescence. Some emission bands are attributed to a radiative decay of self trapped excitons, others to the recombination of holes with F centers or with electrons trapped at the sites of impurity ions. Experimental data obtained even from differently structured samples, showed similar and consistent results, indicating that radiolysis processes are responsible for the defect formation by X and by VUV-radiation also in this type of crystals. (8 refs.)

101793 Defects induced in single thoria crystals by X and far UV irradiation. N.Kristianpoller, A.Rehavi (Dept. of Phys. & Astron., Tel Aviv Univ., Tel Aviv, Israel).
Radiat. Eff. (GB), vol.72, no.1-4, p.209-17 (1983). (Proceedings of the Fourth Europhysical Topical Conference on 'Lattice Defects in Ionic Crystals', Dublin, Ireland, 29 Aug.-3 Sept. 1982).
Effects of X and of monochromatic vacuum UV irradiations on nominally pure and on Y^{3+} doped ThO_2 crystals were studied by optical and electrical methods. A strong luminescence appeared during the irradiations at 80K; the spectral composition and temperature dependence of the main emission bands were measured. Irradiation at 80K and heating to 500K caused the appearance of TL and TSC peaks. TL excitation spectra were measured and showed maxima at wavelengths corresponding to band-to-band transitions as well as at the long wavelength tail of the fundamental absorption. Results indicate that the UV induced defects are identical with some of those created by X-rays. The emission spectra showed in addition to the known impurity bands also broad bands at 305, 450 and 500 nm. The 305 nm band is apparently due to the intrinsic recombination of self trapped excitons. The 450 and 500 nm bands, which were also dominant in most TL peaks, are attributed to recombination processes of holes with F and F^+ centers respectively. (5 refs.)

101794 F and photochromic centers in $LiYF_4$:Nd crystals. S.P.Morato, T.C.A.Macedo (Inst. de Pesquisas Energeticas e Nucleares, Sao Paulo, Brazil).
Radiat. Eff. (GB), vol.72, no.1-4, p.229-35 (1983). (Proceedings of the Fourth Europhysical Topical Conference on 'Lattice Defects in Ionic Crystals', Dublin, Ireland, 29 Aug.-3 Sept. 1982).
Samples of Nd doped $LiYF_4$ single crystals (scheelite structure) were X-irradiated at room temperature and valence changes plus defect production by radiation damage were studied by optical spectroscopy techniques. The band centered at 3.70 eV showed a temperature dependent gaussian shape indicating a strong electron-phonon coupling suggestive of an F type center defect. Reversible valence changes of $Nd^{3+} \rightarrow Nd^{2+}$ transitions after irradiation were observed throughout luminescence studies when $(Nd^{3+})^* \rightarrow Nd^{3+}$ transitions were identified. A new band centered at 4.57 eV was found. This band showed an optical switching mechanism and a correlation to the $4D_{3/2}$ transition of the Nd^{3+} ion. This band was assigned as being due to a photochromic $(F\text{-}Nd^{3+})$ center. (7 refs.)

101795 Determination of the threshold-displacement energy in α-Al_2O_3 by high-voltage electron microscopy. G.Das (Super Semi Conductor (P), Calcutta.Ltd.,India).
J. Mater. Sci. Lett. (GB), vol.2, no.8, p.453-6 (Aug. 1983).
The author describes the determination of the displacement-threshold energy of α-Al_2O_3 single crystals having [0001] and ⟨1120⟩ orientations by the HVEM method of monitoring the onset of observable defect clusters. (11 refs.)

101796 Heating of solid targets by electron beams. M.K.Bhattacharyya, D.T.Tuma (Dept. of Electrical Engng., Carnegie-Mellon Univ., Pittsburgh, PA, USA).
IEEE Trans. Electron Devices (USA), vol.ED-30, no.6, p.602-8 (June 1983).
The heating of a solid material by a high-energy electron beam is discussed. The two-dimensional transient nonlinear heat equation has been solved by the finite element method, considering both the penetration of the beam into the target and its finite size. The importance of the temperature dependences of each of the material properties on melt time have been established. Results are presented for the time needed for the first melting of the target for Cu, Al, Si, GaAs, impinged by beams having energies and parameters covering a wide range of values. Also the regimes of validity of the one-dimensional heat equation are discussed. (25 refs.)

101797 Thermal profiles and thermal stresses introduced on silicon during scanning line shaped beam annealing. L.Correra, G.G.Bentini (CNR-Istituto Lamel, Bologna, Italy).
J. Appl. Phys. (USA), vol.54, no.8, p.4330-7 (Aug. 1983).
The evaluation of thermal profiles and introduction of defects due to thermal stresses induced on ⟨100⟩ silicon during the annealing carried out by the scanning of a line shaped *e*-beam source, has been performed. The computation of the temperature profiles along the sample for different beam scan speed and incident power has been used to evaluate the two-dimensional map of the thermal stresses induced over a 4×2 cm^2 silicon sample ⟨100⟩ oriented. The computed stresses were then compared with the yield stress of the material at the actual annealing temperature. The topographic distribution of the thermal stresses shows quite a complicated trend changing drastically from compressive to tensile as a function of beam position along the sample; it can be concluded that the introduction of defects takes place mainly at the edge of the sample which is irradiated last. An experimental check of the authors' computations has been performed by using a fast multiscanning electron beam along a line, joined to a mechanical translation of the sample through the scanned region. Pyrometric temperature measurements performed during the irradiation confirm our computed temperature profiles, whereas both sheet resistivity measurements and X-ray topography show that the introduction of defects actually takes place in the region of the sample and at the irradiation conditions foreseen by the present computation. (19 refs.)

101798 Creation of quasistable lattice defects by electronic excitation in SiO_2. K.Tanimura, T.Tanaka, N.Itoh (Dept. of Crystalline Materials Sci., Nagoya Univ., Nagoya, Japan).
Phys. Rev. Lett. (USA), vol.51, no.5, p.423-6 (1 Aug. 1983).
The transient volume change of α-quartz and fused silica induced by irradiation with an electron pulse has been measured above 80K. It is shown that transient changes of volume and optical absorption due to the E_1' centers (oxygen vacancies) decay in parallel and that he volume change per E_1' center is of the order of a unit molecular volume. The results show unambiguously that recombination-induced defect formation occurs in SiO_2 but the defects created are not stable even at low temperatures. (24 refs.)

101799 Recent studies of radiation induced F-center and colloid particle formation in synthetic NaCl and natural rock salt. P.W.Levy, J.M.Loman, K.J.Swyler, D.R.Dougherty (Brookhaven Nat. Lab., Upton, NY, USA).
Radiat. Eff. (GB), vol.72, no.1-4, p.303-8 (1983). (Proceedings of the Fourth Europhysical Topical Conference on 'Lattice Defects in Ionic Crystals', Dublin, Ireland, 29 Aug.-3 Sept. 1982).
Radiation induced F-center and Na metal colloid formation have been studied, at temperatures between 100 and 350°C, in melt grown synthetic NaCl crystals and natural rock salt samples, using equipment for making optical measurements during 1-3 MeV electron irradiation. In both types of NaCl the damage formation kinetics are qualitatively similar. However, there are large quantitative differences which depend on irradiation temperature, dose rate, total dose, inherent strain, strain applied prior to irradiation and other factors. Natural rock salt samples from different localities exhibit markedly different radiation induced colloid formation rates. An extrapolation of the current data to the doses expected in radioactive waste depositories indicate that natural salt immediately adjacent to the planned waste canisters could develop between 0.1 and 50 percent colloidal sodium in 50 to 400 years. (13 refs.)

101800 Disordering kinetics in neutron and electron irradiated Fe-Co alloy. J.P.Riviere, J.F.Dinhut (Lab. de Metallurgie Phys., Poitiers, France).
Scr. Metall. (USA), vol.17, no.7, p.885-8 (July 1983).
Electrical resistivity measurements have been used to study the disordering kinetics under irradiation at liquid hydrogen temperature either with 2.5 MeV electrons or fission neutrons in an equiatomic Fe-Co ordered alloy. (20 refs.)

101801 Mechanism of contamination build-up induced by fine electron probe irradiation. N.Yoshimura, H.Hirano, T.Etoh (JEOL Ltd., Tokyo, Japan).
Vacuum (GB), vol.33, no.7, p.391-5 (July 1983).
To clarify the transfer mechanism of contaminating molecules and the dominant source of them, carbon thin films were irradiated with a fine electron probe of 12 nm dia using three types of anti-contamination devices, individually. No contamination deposit was observed for a certain period or an incubation time after the specimen was pretreated by an electron beam shower. After the incubation time, the growth rate increased gradually with the elapsed time after the electron beam shower treatment and reached the saturated rate. The incubation time and the saturated growth rate depended largely on the type of the anti-contamination device used. It can be concluded that hydrocarbon molecules being adsorbed on the specimen surface are transferred to the irradiated area by surface diffusion. The dominant source of contaminating molecules is the residual gas molecules in the vicinity of the specimen even in a clean high vacuum. (11 refs.)

101802 Analysis of temperature and stress profiles induced by a CW line scanned electron beam in ⟨100⟩ oriented silicon. G.G.Bentini, L.Correra (CNR, Istituto Lamel, Bologna, Italy).
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.241-6
Evaluation of thermal profiles along the scan direction of a line shaped e-beam as well as the topographic distribution of the thermally induced stresses have been performed by solving the heat diffusion equation for several incident power values. The resulting stresses have been computed in the 'nearly isotropic' approximation but taking into account that the slip planes, in ⟨100⟩ oriented silicon crystals, are (111) and the slip directions in the plane are ⟨110⟩. The threshold of damage introduction has been evaluated by comparing the computed stresses with the yield stress of the material at any annealing temperature. Experimental observations based on X-ray topography have been performed in order to study the damage introduction on ⟨100⟩ silicon samples annealed in the same conditions used for stress computation. A very good agreement between computed and experimental results was found. (9 refs.)

101803 Evaluation method of fast neutron irradiation dose in JMTR. F.Sakurai, T.Niibo.
J. At. Energy Soc. Jpn. (Japan), vol.25, no.5, p.372-82 (May 1983). In Japanese.
The neutron fluence above 1.0 MeV or 0.1 MeV is routinely reported as the fast neutron irradiation dose value for materials irradiation experiments in the Japan Materials Testing Reactor (JMTR). The radiation damage of materials is, however, affected by not only the amount of the neutron fluence but also the neutron energy spectrum. Therefore, in the radiation damage studies of materials the neutron irradiation dose values should be expressed in the exposure parameter containing the information of the neutron energy spectrum. The authors describe some exposure parameters such as displacement per atom and damage fluence, and correlations between these parameters and the neutron fluence above 1.0 MeV in the JMTR. These parameters have deep connections with changes in the physical properties of materials under neutron irradiation. The neutron irradiation dose values in the JMTR can be evaluated in some kinds of exposure parameters containing the information of the neutron energy spectrum from the neutron fluence above 1.0 MeV measured using the $^{54}Fe(n,p)^{54}Mn$ monitor. (5 refs.)

101804 Microstructural and microchemical comparisons of AISI 316 irradiated in HFIR and EBR-II. H.R.Brager, F.A.Garner (Westinghouse Hanford Co., Richland, WA, USA).
J. Nucl. Mater. (Netherlands), vol.117, p.159-76 (July 1983). (Proceedings of the Symposium on Radiation Damage Analysis for Fusion Reactors, St. Louis, MO, USA, 25-28 Oct. 1982).
Two alternative interpretations of a unique but limited set of swelling data have been advanced in an attempt to predict the influence of helium on the swelling of 20% cold-worked AISI 316. It is shown that swelling data for annealed AISI 316 provide substantial insight concerning the role of helium on swelling. Additional insight has been obtained by a series of microstructural and microchemical examinations conducted on specimens of both annealed and cold-worked steel after irradiation in EBR-II and HFIR. These reactors differ greatly in neutron spectra and in AISI 316 generate quite different helium/d.p.a. ratios and solid transmutant levels. At least in the range 500-750°C, the results of these studies show that helium's influence on swelling is manifested in the cavity density but not in the dislocation density or the major features of the microchemical evolution of the alloy matrix. The results also suggest that the influence of helium at high displacement levels is not strong on either the total swelling or the steady-state swelling rate. (59 refs.)

101805 Impact of the injected interstitial on the correlation of charged particle and neutron-induced radiation damage. F.A.Garner (Westinghouse Hanford Co., Richland, WA, USA).
J. Nucl. Mater. (Netherlands), vol.117, p.177-97 (July 1983). (Proceedings of the Symposium on Radiation Damage Analysis for Fusion Reactors, St. Louis, MO, USA, 25-28 Oct. 1982).
The successful conclusion of an intercorrelation program developed in the US Breeder program has provided significant insight on the factors governing the swelling that develops in ion-bombardment studies and its relationship to the swelling that occurs during neutron irradiation. It appears that the injected interstitial or a related phenomenon exerts a pronounced influence on ion-induced swelling. This conclusion has ramifications with respect to the conduct and interpretation of ion irradiation experiments employed to study the effect of helium or composition on swelling. (56 refs.)

101806 Ion mass effects on bombardment-induced disordering of γ'-Ni_3Si. S.P.Lamond, D.I.Potter (Metall. Dept., Univ. of Connecticut, Storrs, CT, USA).
J. Nucl. Mater. (Netherlands), vol.117, p.64-9 (July 1983). (Proceedings of the Symposium on Radiation Damage Analysis for Fusion Reactors, St. Louis, MO, USA, 25-28 Oct. 1982).
The kinetics of disordering of the ordered compound γ'-Ni_3Si during ion bombardment were investigated at a temperature of 270°C. The disordering followed first order kinetics and the rate constant was measured as a function of incident ion flux, ion energy, and ion mass. The rate constant varied approximately in direct proportion with the ion flux during bombardment with 1 MeV $^{84}Kr^+$-ions: from ~ 0.28 min^{-1} at ~ 70 nA/cm^2 to ~ 50 min^{-1} at ~ 4.4 μA/cm^2. During bombardment with a flux of ~ 1 μA/cm^2 of $^{132}Xe^+$-ions, the rate constant was directly proportional to the calculated near-surface damage rate. It varied from ~ 50 min^{-1} for 200 KeV ions with calculated damage rates of $\sim 2.3 \times 10^{-2}$ dpa/s to ~ 1.8 min^{-1} for 3 MeV ions with damage rates of 2×10^{-3} dpa/s. The disordering rate was also observed to be directly proportional to the near surface damage rate for heavier mass ions ($^{40}Ar^+$, $^{84}Kr^+$ and $^{132}Xe^+$); the ratio of disordering rate to damage rate was ~ 17. This ratio dropped to ~ 3 for $^{20}Ne^+$-ion bombardment, and to ~ 0.4 for bombardment with $^4He^+$-ions. The decrease in the ratio with decreasing mass is discussed in terms of cascade size, replacement-to-displacement ratio, and random recombination. (9 refs.)

101807 Compositional changes in Fe-Cr-Ni alloys under proton bombardment at elevated temperatures. N.Q.Lam (Materials Sci. & Technol. Div., Argonne Nat. Lab., Argonne, IL, USA).
J. Nucl. Mater. (Netherlands), vol.117, p.106-12 (July 1983). (Proceedings of the Symposium on Radiation Damage Analysis for Fusion Reactors, St. Louis, MO, USA, 25-28 Oct. 1982).
Compositional redistribution in austenitic Fe-Cr-Ni alloys during energetic proton bombardment has been calculated as a function of time, temperature, and ion energy, using a kinetic model of radiation-induced segregation recently developed for ternary alloys. The effect of spatial nonuniformity in damage rates was taken into account and found to have a peculiar effect on the redistribution of the alloying elements. Enrichment of Ni occurs at the bombarded surface and in the bulk beyond the damage range, whereas Fe and Cr are enriched in the peak-damage region at the expense of their depletion in regions near the surface and beyond the damage range. These compositional changes can lead to local phase transformation, since the composition of local regions of the alloy is shifted away from the initial composition into different parts of the multicomponent phase diagram. The stability of the austenite phase in the sub-surface and post-range regions is enhanced by irradiation, while the austenite-to-ferrite transformation takes place in the peak-damage region. (16 refs.)

101808 Void growth in a pulsed irradiation environment. J.L.Brimhall, E.P.Simonen, L.A.Charlot (Pacific Northwest Lab., Richland, WA, USA).
J. Nucl. Mater. (Netherlands), vol.117, p.118-22 (July 1983). (Proceedings of the Symposium on Radiation Damage Analysis for Fusion Reactors, St. Louis, MO, USA, 25-28 Oct. 1982).
The shrinkage of voids in pure nickel during the pulse annealing period was found to be significant only for very small voids. Rapid void growth and coarsening become the dominant mechanism early in the irradiation period at high temperatures. Pulsed irradiation produced increased coarsening which could be accounted for by increased time at temperature compared to steady irradiation. Qualitatively the change in microstructure upon changing irradiation temperature agreed with results from other studies. (8 refs.)

101809 Effects of pulsed dual-ion irradiation on phase transformations and microstructure in Ti-modified austenitic alloy. E.H.Lee, N.H.Packan, L.K.Mansur (Metals & Ceramics Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
J. Nucl. Mater. (Netherlands), vol.117, p.123-33 (July 1983). (Proceedings of the Symposium on Radiation Damage Analysis for Fusion Reactors, St. Louis, MO, USA, 25-28 Oct. 1982).
The influence of pulsed 4 MeV Ni ion bombardment with and without simultaneous helium injection, has been explored in a low swelling, Ti-modified austenitic stainless steel. Irradiations were carried out to 70 d.p.a. at 950K; the pulsing frequencies were either 60 s on/off or 1 s on/off. Compared to continuous irradiation, pulsing caused a decrease in the interstitial loop diameter at 1 d.p.a., although at higher doses the overall dislocation density was not affected. Pulsing and helium both promoted the stability of MC precipitates and retarded the subsequent G phase formation; in some cases G-phase was suppressed and η phase formed instead. Small bubble-like cavities were observed to grow into large voids after steady dual beam irradiation to 70 d.p.a.. However, this conversion was suppressed by pulsed irradiation to 70 d.p.a. and furthermore the sizes of the small cavities were somewhat reduced. The results are explained in terms of current mechanistic understanding of mean point defect kinetics and the evolution of microstructure and microcomposition during irradiation with superimposed annealing periods. (20 refs.)

101810 Depth dependent damage profile in stainless steel irradiated with He-ions. K.Shiraishi, K.Fukai (Div. of Nuclear Fuel Res., Ibaraki-ken, Japan).
J. Nucl. Mater. (Netherlands), vol.117, p.134-42 (July 1983). (Proceedings of the Symposium on Radiation Damage Analysis for Fusion Reactors, St. Louis, MO, USA, 25-28 Oct. 1982).
Type 316 stainless steel was irradiated with 24 MeV He-ions up to 3.2×10^{20} ions/m^2 at ambient temperature. A peak in microhardness occurred at a distance of 105 μm. A pair of parallel lines with a space of 8 μm centered at a distance of 107 μm from the radiated surface were revealed on the top surface of the specimen by chemical etching after post-irradiation annealing for 1 h at 1023K. The parallel lines correspond to arrays of fairly large Frank loops aligned in narrow bands on each side of a region containing helium bubbles. The observed damage profiles agree with those predicted by Littmark and Ziegler. (25 refs.)

101811 Effect of helium preinjection and prior thermomechanical treatment on the microstructure of type 316 SS. A.Kohyama, G.Ayrault, A.P.L.Turner, N.Igata (Materials Sci. & Technol. Div., Argonne Nat. Lab., Argonne, IL, USA).
J. Nucl. Mater. (Netherlands), vol.117, p.143-50 (July 1983). (Proceedings of the Symposium on Radiation Damage Analysis for Fusion Reactors, St. Louis, MO, USA, 25-28 Oct. 1982).
Samples of 316 SS were preinjected with 15 a.p.p.m. helium either hot (650°C) or cold (room temperature) and irradiated with 3 MeV Ni^+ ions to a dose level of 25 d.p.a. at 625°C in order to test the validity of helium preinjection as a means of simulation of transmutant helium production. Results for preinjected and single-ion irradiated samples were compared to samples irradiated at 625°C to a 25 d.p.a. dose level with 3 MeV Ni^+ and simultaneously injected with helium at a rate of 15 a.p.p.m. He/d.p.a. (dual-ion irradiated samples). Preinjected samples exhibited bimodal cavity size distributions. Preinjected samples of solution annealed or solution annealed and aged material showed lower swelling than dual-ion irradiated samples. However, He preinjected 20% cold worked samples showed greater swelling than dual-ion irradiated samples. (8 refs.)

101812 Influence of helium injection schedule and prior thermomechanical treatment of the microstructure of type 316 SS. A.Kohyama, G.Ayrault, A.P.L.Turner (Materials Sci. & Technol. Div., Argonne Nat. Lab., Argonne, IL, USA).
J. Nucl. Mater. (Netherlands), vol.117, p.151-8 (July 1983). (Proceedings of the Symposium on Radiation Damage Analysis for Fusion Reactors, St. Louis, MO, USA, 25-28 Oct. 1982).
The influence of different helium injection schedules on microstructure development in Ni^+ ion-irradiated 316 SS at 625 °C is discussed. Injection schedules were chosen to either approximate the MFR condition or mimic the mixed-spectrum reactor condition. Dual-iron irradiation to 25 d.p.a. produced strongly bimodal cavity size distributions in solution annealed and solution annealed and aged samples, whereas single-ion irradiation followed by dual-ion irradiation to the same dose produced a cavity size distribution with a substantial component of intermediate-size cavities. Dual-ion irradiation produced only very small cavities in 20% CW material, while single-ion followed by dual-ion irradiation produced some intermediate size cavities and greater swelling. (3 refs.)

101813 Evolution of cavity size distributions in dual-ion irradiated austenitic stainless steel and Fe-Cr-Ni ternary alloys. J.A.Spitznagel, W.J.Choyke, J.Lauer, B.O.Hall (Westinghouse Res. & Dev. Center, Pittsburgh, PA, USA), J.N.McGruer, J.R.Townsend, R.B.Irwin.
J. Nucl. Mater. (Netherlands), vol.117, p.198-207 (July 1983). (Proceedings of the Symposium on Radiation Damage Analysis for Fusion Reactors, St. Louis, MO, USA, 25-28 Oct. 1982).
The first four moments of experimentally measured cavity size distributions in dual-ion irradiated 304SS Fe-12Ni-15Cr and Fe-30Ni-15Cr alloys have been calculated for a range of fluences, helium injection rates, and irradiation temperatures. The moments are shown to correctly describe the effects of alloy composition, fluence, helium and temperature on the evolution of the cavity size distributions. Experimentally determined moments are compared with those calculated from cavity nucleation and growth theories. The moments reflect the competition between nucleation and growth processes and provide insight into the details of the transient low swelling regime. (22 refs.)

101814 Effects of temperature and helium on void formation in self-ion irradiated aluminum. S.K.McLaurin, G.L.Kulcinski (Dept. of Nuclear Engng., Univ. of Wisconsin, Madison, WI, USA), R.A.Dodd.
J. Nucl. Mater. (Netherlands), vol.117, p.208-12 (July 1983). (Proceedings of the Symposium on Radiation Damage Analysis for Fusion Reactors, St. Louis, MO, USA, 25-28 Oct. 1982).
High-purity aluminum was irradiated with 9 MeV aluminum ions at several temperatures in the range 25-125°C, both with and without pre-injected helium. The aluminum ion irradiation doses ranged from 0.2 to 20 d.p.a. Void swelling in the temperature range studied was found to occur only when the aluminum contains helium gas, and as little as 0.1 a.p.p.m. helium is sufficient to nucleate a substantial void population. In the absence of helium, even doses of 20 d.p.a. do not result in void formation. The void number density and size follow the general trends in conventional nucleation theories, and are similar to trends observed in nickel and stainless steels. The microstructure quite often contained heterogeneous distributions of void stringers, suggesting nucleation of voids on dislocations. (17 refs.)

101815 Helium bubble formation in Cu, Ni and Cu-Ni alloys. S.J.Zinkle, R.A.Dodd, G.L.Kulcinski, K.Farrell (Dept. of Nuclear Engng., Univ. of Wisconsin, Madison, WI, USA).
J. Nucl. Mater. (Netherlands), vol.117, p.213-17 (July 1983). (Proceedings of the Symposium on Radiation Damage Analysis for Fusion Reactors, St. Louis, MO, USA, 25-28 Oct. 1982).
Copper, nickel, and Cu-Ni alloys have been irradiated with 200-400 keV ^3He ions at a constant homologous temperature of $T/T_m = 0.65$. The samples have been analyzed by TEM to compare helium bubble size and density. Visible bubbles were observed in all samples. The pure copper and the Cu-Ni alloys were found to contain similar bubble densities and sizes after irradiation. The pure nickel samples contained helium bubbles of smaller size and higher density as compared to the alloys. (14 refs.)

101816 Effect of irradiation on phosphorus segregation. J.L.Brimhall, D.R.Baer, R.H.Jones (Pacific Northwest Lab., Richland, WA, USA).
J. Nucl. Mater. (Netherlands), vol.117, p.218-23 (July 1983). (Proceedings of the Symposium on Radiation Damage Analysis for Fusion Reactors, St. Louis, MO, USA, 25-28 Oct. 1982).
Phosphorus strongly segregated to the surface during irradiation of austenitic-type alloys in the temperature range 775-925 K. Much weaker but measurable radiation induced segregation of phosphorus occurred in a Ni+0.03% P alloy. Irradiation under similar conditions produced no measurable phosphorus segregation in the ferritic HT-9 or Fe+0.003% P alloy. The lack of segregation in the ferritic alloys was suggested to result from a weak point defect-impurity interaction in the BCC iron structure while a strong interaction was suggested for the FCC iron structure. The slow accumulation of radiation damage in BCC iron alloys is also consistent with a lack of observable segregation. The evidence strongly suggests a radiation induced mechanism but a radiation enhanced, thermally activated equilibrium segregation cannot be ruled out. (23 refs.)

101817 **Saturation of proton-induced swelling in AISI 316.** A.Kumar (Dept. of Nuclear Engng., Univ. of Missouri, Rolla, MO, USA), F.A.Garner.
J. Nucl. Mater. (Netherlands), vol.117, p.234-8 (July 1983). (Proceedings of the Symposium on Radiation Damage Analysis for Fusion Reactors, St. Louis, MO, USA, 25-28 Oct. 1982).
There is some evidence which suggests the void swelling may not increase continuously with increasing irradiation but may saturate a level dependent on irradiation conditions, helium/d.p.a. level or artifacts of the simulation such as the presence of injected interstitials. An experiment was therefore performed to determine the saturation level of swelling of annealed AISI 316 at 625°C in the absence of helium and injected interstitials. Using 140 keV protons and step-height measurements it was found that saturation did not occur until 260% swelling was achieved at ~600 d.p.a.. Prior to saturation the swelling curve exhibited the anticipated bilinear form with a steady state swelling rate of 0.64%/d.p.a. based on a 20 eV threshold energy. (24 refs.)

101818 **Oxygen implantation in GaAs: damage studies.** R.S.Bhattacharya, A.K.Rai, P.P.Pronko (Universal Energy Systems Inc., Dayton, OH, USA).
Phys. Status Solidi a (Germany), vol.78, no.1, p.283-6 (16 July 1983).
Rutherford backscattering-channeling (RBS-C) and transmission electron microscopy (TEM) are used to investigate the level and nature of the damage in O^+ implanted GaAs layers before and after annealing at 700°C. Two different energies, 80 and 350 keV are used in the dose range of 5×10^{13} to 5×10^{15} cm^{-2}. Damage in the as implanted layer is found to increase as a function of dose, but the layers remained crystalline for the dose range employed. Furnace annealing at 700°C for 15 min removes all the damage up to the dose of 1×10^{15} cm^{-2}. Dislocation lines and loops are observed in the case of 5×10^{15} cm^{-2} implanted layer. However, no precipitation of oxygen is observed in any of these samples. (12 refs.)

101819 **The annealing behavior of ion-irradiated garnet crystals.** B.Strocka, P.Hansen, H.Heitmann (Forschungslab. Hamburg, Philips GmbH, Hamburg, Germany).
Radiat. Eff. (GB), vol.72, no.1-4, p.219-27 (1983). (Proceedings of the Fourth Europhysical Topical Conference on 'Lattice Defects in Ionic Crystals', Dublin, Ireland, 29 Aug.-3 Sept. 1982).
The relaxation of irradiation induced lattice strain in single crystalline garnet caused by thermal annealing in oxygen has been studied by means of rocking curves using an X-ray double-crystal diffractometer. A 4-μm thick epitaxial $Y_{2.8}La_{0.2}Fe_{4.2}Ga_{0.8}O_{12}$ garnet film on a (111) $Gd_3Ga_5O_{12}$ substrate was irradiated with ^{238}U-ions of 1.4 MeV/u specific energy with doses from 10^{10} cm^{-2} to 3×10^{11} cm^{-2}. Annealing of the irradiated crystal volume becomes significant around 700K with a higher annealing rate for the substrated compared to the epitaxial film. At temperatures above 1300K a decrease of the film lattice constant due to decomposition, preferentially in the irradiated areas, is observed. From the correspondence of the annealing behavior of the irradiation induced lattice variation with that of the saturation magnetization, the Faraday rotation and optical absorption, it is inferred that the annealing process occurs stepwise. (13 refs.)

101820 **Ferromagnetism of alloys: a new probe in ion implantation.** M.Hitzfeld, P.Ziemann, W.Buckel (Phys. Inst. Univ. Karlsruhe, Karlsruhe, Germany), H.Claus.
Solid State Commun. (USA), vol.47, no.7, p.541-4 (Aug. 1983).
It is demonstrated that the ferromagnetic transition temperature of PdFe alloys is a very sensitive probe for lattice defects produced by the implantation of Fe^+ into Pd films and foils. Using this new probe it is shown that the large difference in defect concentration in implanted films and foils is due to a difference in oxygen content. (14 refs.)

101821 **Gas desorption during irradiation of metals with molybdenum ions.** N.P.Katrich, V.N.Kanishchev.
Sov. At. Energy (USA), vol.53, no.6, p.832-6 (Dec. 1982). Translation of: *At. Energ. (USSR)*, vol.53, no.6, p.379-82 (Dec. 1982).
The authors investigate the mechanism of gassing during bombardment of a solid with accelerated heavy ions. (7 refs.)

101822 **Simulation of reactor conditions in investigations of radiation damage of the surface of materials.** B.A.Kalin.
Sov. At. Energy (USA), vol.53, no.6, p.837-41 (Dec. 1982). Translation of: *At. Energ. (USSR)*, vol.53, no.6, p.382-6 (Dec. 1982).
The study of radiation damage of a surface under bombardment with light ions is of interest for estimation of the durability of materials in fusion reactors and, as a rule, is based on models. In order to simulate the effect of the expected integrated energy spectrum, e.g. materials have been bombarded successively with monoenergetic helium-ion beams of various energies. In this case it has been shown that with the same total dose of implanted helium, blistering and erosion turned out to be less than under bombardment with a helium beam of the same energy. (25 refs.)

101823 **Transient conductivity measurements in pulsed ion beam melted silicon.** R.M.Fastow, J.Gyulai, J.W.Mayer (Dept. of Materials Sci. & Engng., Cornell Univ., Ithaca, NY, USA).
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.69-74
A pulsed proton beam, ~200 ns in duration, has been used to melt and regrow single crystal silicon. The protons had an energy of 300 kev, yielding a measured energy density of 0.8-2.0 J/cm^2. The method of transient conductivity has been used to determine the melt depths, melt durations, and regrowth velocities. The measured values for 2.0 J/cm^2 were, respectively, 1.7 μm, 2 μsec, and 1.4 m/sec. Computer generated melt curves were compared to experiment with good agreement. The energy required to initiate melt was determined, and a linear dependence of melt depth with energy has been observed. (8 refs.)

101824 **Ranges, reflections and secondary electron emission for keV hydrogen ions incident on solid N_2.** P.Borgesen, H.Sorensen, Chen Hao-Ming (Assoc. Euratom-Rise Nat. Lab., Roskilde, Denmark).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.212, no.1-3, p.517-28 (1 July 1983).
Ranges were measured for 0.67-3.3 keV/amu hydrogen and deuterium ions in solid N_2. Comparisons with similar results for N_2-gas confirm the previously observed large phase effect in the stopping cross section. Measurements of the secondary electron emission coefficient for bulk solid N_2 bombarded by 0.67-9 keV/amu ions also seem to support such a phase effect. (78 refs.)

101825 **Accuracy of stopping cross section determination from RBS-spectra by Warters' method.** F.Aumayr, P.Bauer, D.Semrad (Inst. fur Experimentalphys., Johannes-Kepler-Univ. Linz, Linz, Austria).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.212, no.1-3, p.529-32 (1 July 1983).
The determination of stopping cross sections from the width of Rutherford backscattering (RBS) spectra by the method of Warters (1953) implies approximations that lead to systematic errors for the derived quantities. These errors are determined by computer calculations for protons in the energy range from 60 keV to 1 MeV and for a scattering angle of 175°. All elements from lithium to uranium are taken as target materials. Graphs are presented from which the accuracy of the method can be read quantitatively, as a function of the atomic number Z_2, the areal density of the target and the energy. It turns out, e.g., that for $Z_2>8$, areal mass densities below 100 $\mu g/cm^2$ and proton energies above 250 keV the systematic error of Warters' method is below 1% but that for an aluminium target of 100 $\mu g/cm^2$, it may reach 10% at 100 keV. (5 refs.)

101826 **Characteristics and applications of radiation from channeled particles.** R.H.Pantell, H.Park, R.L.Swent, J.O.Kephart, R.K.Klein (Dept. of Electrical Engng., Stanford Univ., Stanford, CA, USA), S.Datz, B.L.Berman.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3150-4 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Charged particles channeled in crystals traverse nearly periodic trajectories, which produce radiation that has spectral peaks at photon energies determined by the particle energy and the periodicity of the motion. This effect is analogous to the radiation enhancement that occurs when a magnetic undulator is placed in a storage ring. For $\gamma=10$ to 100, the period of the motion is several hundred to several thousand lattice sites in the crystal, so that the forward directed emission is in the soft-to-hard X-ray portion of the spectrum. Channeling radiation can be used to study the channeling phenomenon, to investigate the properties of crystals in which channeling occurs, and as a source of X-rays. (12 refs.)

101827 **Temperature effect on the increase of the Kumakhov radiation yield at axial channeling of relativistic electrons.** F.F.Komarov (Inst. of Appl. Phys. Problems, Belorussian State Univ., Minsk, USSR), V.I.Telegin, M.H.Hokonov.
Phys. Lett. A (Netherlands), vol.96A, no.9, p.491-3 (1 Aug. 1983).
The possibility of a sharp increase of the Kumakhov radiation intensity at low crystal temperatures as compared to room temperature is investigated theoretically. The analysis is based on a solution of the Fokker-Planck kinetic equation describing the change of the particle distribution over the axial channel depth due to scattering at thermal vibrations of nuclei and electrons. 101828 **Excess volumes & deviations in isentropic compressibilities for the binary mixtures of acetonitrile with alcohols.** G.Dharmaraju, P.Venkateswarlu, G.K.Raman (Dept. of Chem., Coll. of Engng., Sri Venkateswara Univ., Tirupati, India).
Indian J. Pure & Appl. Phys., vol.21, no.6, p.352-3 (June 1983).
Excess volumes (V^E) and deviations in isentropic compressibilities (K_s) have been determined at 30°C for the binary systems of acetonitrile with *n*-pentanol, *n*-hexanol, *n*-heptanol and *n*-octanol. Excess volumes have been measured directly by the dilatometric method and isentropic compressibilities have been computed from experimentally determined densities and velocities of sound. The positive values of V^E and K_s in all the systems are attributed to weak complex formation and predominating dissociation of associated alcohols

by acetonitrile. Values of V^E and K_s increase with an increase in chain length of alcohol. (3 refs.)

101829 Fibrillation of the mixtures of crystallizable, amorphous and poorly crystalline polymers. M.V.Tsebrenko (Lab. of Synthetic Fibres, Kiev Technol. Inst. of Light Industry, Kiev, USSR).
Int. J. Polym. Mater. (GB), vol.10, no.2, p.83-119 (1983).
A brief review is given of investigations devoted to the formation of ultrathin fibres in the flow of melt of mixtures of thermodynamically incompatible polymers through forming ducts (fibrillation phenomenon). It considers the mechanism of the process, the role of rheological factors in the initiation of fibrillation, and the peculiarities of viscoelastic properties of melts of polymer mixtures for which this phenomenon is clearly observed. The possibility is shown of controlling the fibrillation process by varying the deformation conditions, rheological properties of mixture components, the introduction of plasticizer, surface-active substance, and varying the degree of dispersion of fibre-forming component. It also points out a number of characteristic properties and structural features of ultrathin synthetic fibres in comparison with the fibres formed using ordinary technology. (78 refs.)

101830 Isentropic pressure derivative of the excess partial molar volume of a mixture. G.C.Benson, M.K.Kumaran (Div. of Chem., Nat. Res. Council of Canada, Ottawa, Canada).
J. Chem. Thermodyn. (GB), vol.15, no.8, p.799-800 (Aug. 1983).
A number of publications on the speed of sound in binary liquid mixtures have reported excess values of the partial molar quantities $K_{S,i}$ defined by the equation $K_{S,i}=\{\partial(V\kappa_S)/\partial n_i\}_{T,p,nj\neq i}$, where V is the volume of the mixture, κ_S is its isentropic compressibility (obtained from the speed of sound), and n_i is the amount of substance of component i. The excess quantity $K_{S,i}{}^E$ is obtained by subtracting from $K_{S,i}$ the value $K_{S,i}{}^{id}$ for the corresponding ideal mixture. On some occasions $-K_{S,i}{}^E$ has been identified with $(\partial V_i{}^E/\partial p)_S$, the isentropic pressure derivative of the excess partial molar volume. The authors investigate this relationship by plotting curves of $(\partial V_i{}^E/\partial p)_s$ for (di-*n*-propyl ether+*n*-heptane) at 298.15K. These curves were calculated using $K_{S,i}{}^E$ values reported previously, and from the results of the authors' investigations of the volume and heat capacity of this mixture. Curves were also obtained from their previous studies of (water+ethanol). (6 refs.)

(see also 03.40D Mathematical theory of elasticity, 81.40J Elasticity and anelasticity)

101831 Elastic properties of metals with the cubic symmetry and an axial texture. E.A.Mityushov, R.A.Admesku, V.I.Yushkov (S.M. Kirov Ural Polytech. Inst., Sverdlovsk, USSR).
Fiz. Met. & Metalloved. (USSR), vol.55, no.6, p.1079-82 (June 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
A method is proposed for calculating the elastic moduli of metals with the cubic symmetry of the crystal lattice and an axial texture. The method can be applied to materials with any type of texture and any dispersion of the texture. It can also be used to determine the average values of the compliance and elastic constants of single crystals from the results of measurements carried out on textured polycrystalline samples. (3 refs.) *A.T.*

101832 Thermoelastic analysis of hybrid fabric composites. T.Ishikawa, Tsu-Wei Chou (Dept. of Mech. & Aerospace Engng., Univ. of Delaware, Newark, DE, USA).
J. Mater. Sci. (GB), vol.18, no.8, p.2260-8 (Aug. 1983).
Examines the thermoelastic behaviour of hybrid fabric composites. The analysis is based upon modifications of the 'fibre undulation model' and 'bridging model' originally developed by the authors for non-hybrid fabric composites. Predictions of elastic stiffness constants as well as in-plane thermal expansion and thermal bending coefficients of hybrids have been made. Numerical results compare very favourably with the limited experimental data available. (15 refs.)

101833 The hydrostatic pressure derivatives of the elastic constants of bismuth alloys. Tu.Hailung, G.A.Saunders (School of Phys., Univ. of Bath, Bath, England).
J. Mater. Sci. (GB), vol.18, no.8, p.2337-44 (Aug. 1983).
Measurements of the effect of hydrostatic pressure on the velocity of ultrasonic waves have been used to obtain the pressure derivatives $(\partial C_{IJ}/\partial P)$ of the elastic constants of single crystals of a bismuth-10 at.% antimony alloy and of heavily tellurium-doped (n-type) bismuth. A theoretical model is used to predict that there should be no electronic (*L* to *L* point) contributions to these pressure derivatives. This is established experimentally by the finding that the $\partial C_{IJ}/\partial P$ values of the n-type bismuth doped with tellurium (carrier density $n=1.2\times10^{20}$ cm^{-3}) are the same within experimental error as those of pure bismuth. The zone centre acoustic mode Gruneisen parameters, obtained from the elastic constants and their pressure derivatives, are used to quantify the anharmonicity of the acoustic mode lattice vibrations for these bismuth alloys. It is concluded that the vibrational anharmonicity of bismuth is insensitive to alloying with up to 10 at.% antimony. (15 refs.)

101834 The elastic strain energy and stability of some idealized lead-bismuth sulphides. K.Aizawa, E.Iguchi (Dept. of Metall. Engng., Yokohama Nat. Univ., Yokohama, Japan), R.J.D.Tilley.
J. Solid State Chem. (USA), vol.48, no.2, p.284-94 (1 July 1983).
The elastic strain energy of idealized structures related to the homologous series of chemically twinned phases xPbS.Bi_2S_3, which includes the naturally occurring sulphides lillianite, $Pb_3Bi_2S_6$, and herovskyite, $Pb_6Bi_2S_9$, have been calculated using the Fourier transform method and an ionic model to represent the bonding. The elastic strain energy depends critically upon the distribution of the Pb and Bi atoms over the sites in the twin planes and the PbS-like matrix between the twin planes. The elastic strain energy terms so calculated do not explain why lillianite and heyrovskyite are the only stable compounds but do account for the fact that doping with other atoms can stabilize members of the homologous series not found in the pseudo-binary PbS-Bi_2S_3 system. (23 refs.)

101835 Temperature dependence of the elastic constants in CsCN measured by Brillouin scattering. K.Strossner, W.Henkel, H.D.Hochheimer, M.Cardona (Max-Planck-Institut fur Festkorperforschung, Stuttgart, Germany).
Solid State Commun. (USA), vol.47, no.7, p.567-71 (Aug. 1983).
The temperature dependence of the elastic constants of CsCN has been studied by Brillouin scattering in the high-temperature disordered cubic phase from 193 to 300K. The elastic constants c_{11} and c_{44} decrease whereas c_{12} increases when approaching the phase transition from above. This anomalous behaviour is similar to that found in NaCN, KCN and RbCN. The softening of the symmetry-adapted elastic constants $c_{Eg}=(c_{11}-c_{12})/2$ and c_{44} can be described by a linear coupling of the strain field and the order parameter. (14 refs.)

101836 Refinement of the equations for calculating the third-order elastic constants of cubic crystals and isotropic media from ultrasonic measurement data. S.S.Sekoyan, E.K.Subbotina (All-Union Sci.-Res. Inst. of Physicotech. & Radio-Engng. Measurements, USSR).
Sov. Phys.-Acoust. (USA), vol.29, no.1, p.55-7 (Jan.-Feb. 1983). Translation of: *Akust. Zh. (USSR)*, vol.29, no.1, p.96-100 (Jan.-Feb. 1983).
The equations used to determine the third-order elastic constants of cubic crystals and isotropic elastic media from measurements of the transit time of elastic waves in samples as a function of the hydrostatic pressure and uniaxial stresses are refined and augmented. (11 refs.)

101837 Kinetics of systems with crystal structure. N.M.Lavrinenko, S.V.Peletminskii, Yu.V.Slyusarenko (Physicotech. Inst., Acad. of Sci., Kharkov, Ukrainian SSR).
Theor. & Math. Phys. (USA), vol.53, no.3, p.1243-52 (Dec. 1982). Translation of: *Teor. & Mat. Fiz. (USSR)*, vol.53, no.3, p.456-68 (Dec. 1982).
The method of ergodic relations is used in conjunction with quasi-averages to find the nonequilibrium statistical operator of weakly homogeneous states of a crystal corresponding to the 'hydrodynamic' stage of evolution. An important role in the construction is played by the procedure of additional averaging over the unit cell of the crystal. Expressions are obtained for the adiabatic moduli of elasticity, the viscous stress tensor, and the thermal conductivity tensor. (4 refs.)

62.20F Deformation and plasticity

(inc. yield, ductility and superplasticity; see also 81.40L Deformation, plasticity and creep)

101838 Deformation anisotropy induced by presence of physical fields. M.R.Sitzer, A.Troost (Inst. fur Werkstoffkunde (Lehrstuhl A),,Aachen. Rheinisch-Westfalische Tech. Hochschule,Germany).
Arch. Eisenhuettenwes. (Germany), vol.54, no.6, p.223-6 (June 1983).
An attempt is made to develop an internally consistent theory of plastic flow with anisotropic hardening induced by physical fields of arbitrary structure. Standard theories of plastic flow based on the assumption that the deformation anisotropy is induced by presence of plastic strain, strain rate and temperature. It is worth to be noted that the presence of plastic anisotropy may be induced by influence of another physical field, like radiation, magnetic fields and so on. (8 refs.)

101839 On experimental two-dimensional models of intercrystalline sliding and fracture in polycrystalline metals. W.Szczepinski (Inst. of Fundamental Technol. Res., Polish Acad. of Sci., Warsaw, Poland).
Arch. Mech. (Poland), vol.34, no.4, p.503-14 (1982).
Simple experimental models of polycrystalline structure of metals composed of rigid hexagonal elements forming a regular aggregate are proposed in order to simulate intercrystalline sliding and fracture. The grain boundaries are simulated by layers of solid lubricant between adjacent hexagons or by rows of holes prepared in a solid block of a ductile metal. The behaviour of these models is compared with the properties of an analogous theoretical model. (8 refs.)

101840 Changes in the flow stress of nickel at low temperatures due to variation of a magnetic field. V.A.Desnenko (Physicotech. Inst. of Low Temperatures, Acad. of Sci., Kharkov, Ukrainian SSR).
Fiz. Met. & Metalloved. (USSR), vol.55, no.6, p.1187-93 (June 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
An analysis was made of characteristic changes in the flow stress of nickel due to the application and removal of a static magnetic field of $H=420$ Oe intensity at temperatures 300, 77, and 4.2K and of a magnetic field $H\leq 34$ kOe at 4.2K. The most important factors responsible for the observed changes in the stress-strain curve on application and removal of magnetic fields were the defect of the Young modulus of nickel, the Joule heating of a sample by eddy currents, and pulling of a part of a sample subjected to an inhomogeneous magnetic field into a solenoid. (20 refs.) *A.T.*

101841 A theory of yielding of amorphous polymers at low temperature—a molecular viewpoint. N.Brown (Dept. of Materials Sci. & Engng., Univ. of Pennsylvania, Philadelphia, PA, USA).
J. Mater. Sci. (GB), vol.18, no.8, p.2241-54 (Aug. 1983).
Nearly homogeneous elastic shear on a molecular level rather than localized defect motion was considered to be the primary strain mechanism prior to yielding. The greatest or ideal value of the yield point for an amorphous polymer in the absence of the thermal activation was calculated. The theory involves a picture of the molecular motions under a shear stress involving three interconnected processes: (1) shearons or intermolecular shear, (2) rotons or intramolecular shear, (3) tubons or motion along the covalent bond. The shear resistance was based on the stress to overcome the van der Waal's bond using a (6-12) potential. The model assumes that all atoms move cooperatively by the above motions, up to the point of yielding. Temperature was considered only as it affects the modulus, but the theory has not been extended to include thermal activation. The predicted vaue of shear yield point divided by shear modulus is <0.064 to 0.092; a review of all the experimental data obtained by extrapolations to 0K gives an average value of 0.076 ± 0.03. (42 refs.)

101842 Stress-strain properties of graft copolymers of polyethylene and acrylic acid. I.F.Osipenko, A.P.Polikarpov, N.R.Prokopchuk (Inst. of Phys. Organic Chem. Byelorussian Acad. of Sci., Minsk, Belorussian SSR).
J. Polym. Sci. Polym. Lett. Ed. (USA), vol.21, no.7, p.527-30 (July 1983).
The ability of graft copolymers of polyethylene (PE) and acrylic acid (AA) to act as cation-exchange materials is determined to a great extent by their stress-strain properties (SSP). The grafting of AA to PE is commonly followed by the deterioration of SSP of an initial polymer. It is possible to prepare strong and highly elastic films on the basis of graft copolymers of PE and AA by the radiation-induced liquid-phase graft copolymerization technique. The dependence of SSP of PE and AA graft copolymers on the segmental mobility of PE macromolecules has been established by comparing the results of mechanical tests to the data obtained by the broad-line proton magnetic resonance (PMR) method. This explained the difference in SSP of copolymers prepared under different conditions as well as outlining the ways of production of cation-exchange materials on the basis of the PE and AA graft copolymers of improved SSP. (12 refs.)

101843 Double gauge theory of stresses and defects. H.Kleinert (Inst. for Theoretical Phys., Univ. of California, Santa Barbara, CA, USA).
Phys. Lett. A (Netherlands), vol.97A, no.1-2, p.51-4 (8 Aug. 1983).
Elasticity and plasticity can both be formulated in a geometric language. In linear approximation, there are two gauge theories. The authors exhibit the dual relationship between the two and present a coupled unified double gauge theory of both stresses and defects. (11 refs.)

101844 On the relation between the plastic strain rate of a crystal and microscopic characteristics of dislocation motion. V.N.Lukerchenko (A.A. Baikov Inst. of Metall., Acad. of Sci., Moscow, USSR).
Phys. Status Solidi a (Germany), vol.78, no.1, p.K9-12 (16 July 1983).
The establishment of the master kinematic relation (MKR), i.e. the relation between the plastic strain rate of a crystal $\dot{\varepsilon}$ and characteristics of dislocation motion, are of great importance in developing the physical theory of plasticity. The authors generalize the relation obtained by Seitz and Reed (1941) to the case of two types of non-straight-line dislocations: loops and segments. (6 refs.)

101845 Plastic flow in close-packed crystals via nonequilibrium molecular dynamics. A.J.C.Ladd (Dept. of Appl. Sci., Univ. of California, Davis, CA, USA), W.G.Hoover.
Phys. Rev. B (USA), vol.28, no.4, p.1756-62 (15 Aug. 1983).
The measurement of plastic-wave profiles in strong shock waves suggests a power-law dependence of the solid-phase shear stress on strain rate. The strain rates in these experiments vary from about 10 kHz to 0.1 GHz. The authors have carried out molecular-dynamics simulations of steady-state plastic flow in two- and three-dimensional close-packed crystals, using recently developed 'nonequilibrium' equations of motion to maintain a constant strain rate and temperature. These calculations appear to be consistent with current experimental data and suggest that the flow of close-packed metals is described by a single physical mechanism over a range of strain rates from 10 kHz to 1 THz. (15 refs.)

101846 Negative photoplastic effect due to the relaxed excited state of the F-center in alkali halides. T.Hagihara (Dept. of Phys., Osaka Kyoiku Univ., Osaka, Japan), Y.Inoue, T.Okada.
Radiat. Eff. (GB), vol.72, no.1-4, p.293-7 (1983). (Proceedings of the Fourth Europhysical Topical Conference on 'Lattice Defects in Ionic Crystals', Dublin, Ireland, 29 Aug.-3 Sept. 1982).
To make clear the mechanism of the photoplastic effect (PPE) in alkali halides containing F-centers, on the basis of the photochemical reaction of the F-center, the temperature dependence of the PPE in KCl, and KBr and NaCl was studied from 95K up to RT. The characteristic critical points θ_ts in colored KCl and KBr were determined to be 110 and 190K, respectively. Below θ_t the sign of the PPE in both crystals was negative, i.e. decrement of the flow stress during light illumination was observed. Moreover, the θ_ts were in good agreement with the temperature where the photoconductivities show remarkable increase in the course of the measurements. The negative PPE is explained in terms of the rotation of the principal strain axis of the relaxed state of the F-center having ⟨100⟩ tetragonarity as to relax the stress around the edge dislocation coming closely. (30 refs.)

101847 Baroplastic effect in superplasticity. I.I.Papirov, V.I.Zaitsev, G.Ya.Akimov, P.I.Stoev, G.F.Tikhinskii, E.S.Karpov, Yu.A.Galkin (Physicotech. Inst., Acad. of Sci., Kharkov, Ukrainian SSR).
Sov. Phys.-Dokl. (USA), vol.27, no.11, p.965-7 (Nov. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.1-3, p.370-2 (Nov. 1982).
Experimental investigation of the influence of high hydrostatic pressure on the behavior of a superplastic material—the alloy Zn-0.4% Al—has made it possible to discover a baroplastic effect in this phenomenon. The finding that the plasticity of the alloy Zn-0.4% Al is reduced under pressure evidently indicates significant changes in the mechanism of superplastic deformation. It is possible that pressure affects the characteristics of grain-boundary glide, i.e. it changes the parameters of the mechanism controlling the superplasticity. In view of the incomplete accommodation of grain-boundary glide, according to present ideas, pores which affect subsequent flow are frequently formed during superplastic flow. The deformation of superplastic materials under high hydrostatic pressures, therefore, should be accompanied by obstruction of pore formation and a lowering of the coefficient of self-diffusion, in addition to possible other defects. (13 refs.)

62.20H Creep

(see also 81.40L Deformation, plasticity and creep)

101848 Effect of impurities on the diffusion-controlled creep activation energy in MgO. J.Crampon, B.Escaig (Lab. de Structure et Proprietes de l'Etat Solide, Univ. des Sci. et Tech. de Lille, Villeneuve d'Ascq, France).
J. Mater. Sci. (GB), vol.18, no.8, p.2283-9 (Aug. 1983).
By studying the theoretical variation of mass-transport self-diffusion activation energy, with temperature and vacancy concentration, the various rate-limiting possibilities for diffusional creep in MgO are discussed. Because of anion-cation ambipolar coupling it is shown that only four distinct regimes of diffusion controlled creep are, in principle, observable in MgO when considering lattice diffusion. As oxygen ions are by far the slowest species a minimum in the activation energy appears at some temperature for an oxygen vacancy excess but correlatively for a magnesium vacancy excess such a minimum should not be observed. The analysis of creep energies in the experimental domain investigated by several authors allows, in the first case, a correlation with the extrinsic diffusion of oxygen vacancies in excess, but in the reverse case of magnesium vacancy excess no such correlation is observed with extrinsic diffusion of rarefied oxygen vacancies. Instead, neutral vacancy pairs should prevail in the diffusional creep of MgO in this case. (20 refs.)

101849 Influence of the shape and transmission regime of current pulses on the plastic strain of zinc crystals. V.I.Stashenko, O.A.Troitskii (Inst. of Phys. Chem., Acad. of Sci., Moscow, USSR).
Sov. Phys.-Dokl. (USA), vol.27, no.11, p.984-5 (Nov. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.1-3, p.638-40 (Nov. 1982).
The application of a pulsed current during the creep of crystals is usually accompanied by a jump in the strain, the size of the jump depending on the structure of the crystals, the size of the prior strain, and the parameters of the current pulses. The study of this dependence, especially the study of the various arrangements for passing the current in the case of the most favorable pulse shape, is also of importance for understanding the physical nature of the heightened plasticity of a metal under the influence of a current. 62.20M Fatigue, brittleness, fracture, and cracks

(inc. hardness; see also 81.40N Fatigue, embrittlement and fracture)

101850 The random variation of stress concentration factors in fibrous composites. R.L.Smith (Dept. of Maths., Imperial Coll. London, London, England).
J. Mater. Sci. Lett. (GB), vol.2, no.8, p.385-7 (Aug. 1983).
S.B. Batdorf and R. Ghaffarian (1982) proposed an extension of the method of S.B. Batdorf (1982) to allow for random stress concentration factors. Specifically, they supposed that the stress concentrations factors have a Weibull distribution, presumably independent of the distribution of the strengths of the fibres themselves. They suggested that this randomness in the stress concentration factors might arise from the fibres being unequally spaced within the matrix, but they did not investigate the relation between the two. The present author derives such a relation in the two-dimensional case. The derivation is based on a simple discrete approximation to the equations of T.M. Hedgepeth (1961). Because of this, the results can only be regarded as an approximate solution to the problem, but they do enable one to draw some qualitative conclusions which are to some extent at variance with the assumptions made by Batdorf and Ghaffarian. (12 refs.)

101851 Role of impurity precipitates in microhardness of NaCl:Sr^{2+} crystals. K.Narasimha Reddy (Dept. of Phys., Arts & Sci. Coll., Osmania Univ., Secunderabad, India), V.Hari Babu.
J. Mater. Sci. Lett. (GB), vol.2, no.8, p.400-2 (Aug. 1983).
An attempt was made to study the hardness of pre-quenched and quenched crystals doped with Sr^{2+} impurity. Depending on temperature, it was found that the precipitation process affected the microhardness of supersaturated solid solution crystals in different ways. (3 refs.)

101852 On subcritical crack growth in ceramics as influenced by grain size and energy-dissipative mechanisms. A.Krell, W.Kreher (Acad. of Sci., Zentralinst. fur Festkorperphys. und Werkstofforschung, Dresden, Germany).
J. Mater. Sci. (GB), vol.18, no.8, p.2311-18 (Aug. 1983).
A model is presented concerning the possibility that an unstable crack becomes stabilized by the initiation of some energy-dissipative mechanism if the stress intensity reaches a threshold value K_I^D. Depending on the toughness and the grain size distribution of the material, different crack propagation modes may occur. For sintered alumina, measurements of the fracture induced photon emission can be explained in terms of this model, substantiating in this way the assumption that microcracking is the dominating form of energy dissipation in this single phase ceramic material. (23 refs.)

101853 The influence of the crack tip stress field on the nucleation and growth of voids. K.Jagannadham (Dept. of Engng. Sci. & Mech., Tennessee Technol. Univ., Cookeville, TN, USA).
Mater. Sci. & Eng. (Switzerland), vol.60, no.2, p.95-108 (Aug. 1983).
The discrete dislocation method is employed to determine the influence of the crack tip stress field on the nucleation and growth of microvoids in the plastic zone. Voids nucleated from both climb-type and glide-type lattice dislocations are considered. In particular, voids in the shear mode parallel to the slip plane and those in the tensile mode either parallel to the crack plane or perpendicular to the slip plane are analyzed to determine the most favorable orientation. The void nucleation and growth leading to the largest decrease in energy or negative energy gradient are chosen as those with the most favorable orientation. The significance that the results have on the experimental observations of the ductile fracture behaviour of metals and alloys with respect to void coalescence mechanism is emphasized. (16 refs.)

62.30 MECHANICAL AND ELASTIC WAVES

(see also 03.40K Mathematical aspects)

101854 Polarization of elastic waves in gyrotropic crystals. S.S.Girgel', P.A.Khilo (State Univ., Gomel', USSR).
Sov. Phys.-Acoust. (USA), vol.29, no.1, p.71 (Jan.-Feb. 1983). Translation of: *Akust. Zh. (USSR)*, vol.29, no.1, p.120-1 (Jan.-Feb. 1983).
The most important evidence of acoustic activity, which is one of the first-order spatial dispersion effects, is a change of polarization of normal modes in crystals. The authors calculate the polarization for arbitrary directions of the wave normal. The results are applicable to media with a stimulated acoustic gyrotropy such as that induced by, for example, an applied magnetic field. (7 refs.)

101855 Electronic phenomena in mechanical relaxation of semiconducting oxide glasses. A.K.Bandyopadhyay, J.Phalippou, J.Zarzycki (Lab. of Materials Sci., Univ. of Montpellier 2, Montpellier, France).
J. Non-Cryst. Solids (Netherlands), vol.57, no.1, p.41-8 (Aug. 1983).
The internal friction spectrum of a $2BaO\text{-}3B_2O_3$ glass does not show any peak. Transition metal oxides are added to this base glass to give rise to semiconductor glasses (V_2O_5 and Fe_2O_3). The internal friction spectra of iron glasses show that relaxation phenomena occur at relatively high temperature and for low amounts of Fe_2O_3. For vanadium glasses it is necessary to add a large quantity of TM oxide to observe a relaxation effect. A mixed TM oxide (Fe+V) glass does not show any relaxation due to the high activation energy of the vanadium ion. (15 refs.)

62.50 HIGH-PRESSURE AND SHOCK-WAVE EFFECTS IN SOLIDS

101856 The compressibility measurements of ThO_2, Li_2O and $4H\text{-}CdI_2$ by using a diamond-anvil pressure cell. A.Kaimai, H.Arashi, M.Ishigame (Res. Inst. for Sci. Measurements, Tohoku Univ., Sendai, Japan).
Bull. Res. Inst. Sci. Meas. Tohoku Univ. (Japan), vol.31, no.2-3, p.109-19 (1982). In Japanese.
The compressibility measurements of ThO_2, Li_2O and $4H\text{-}CdI_2$ are described. A pressure dependence of lattice constant of these materials measured by X-ray diffractions at high pressures is used to determine the compressibilities. The high pressure is obtained using a diamond-anvil pressure cell. The compressibilities of ThO_2 and Li_2O which are measured for the first time are used to determine Gruneisen constants. The compressibility of layered compound $4H\text{-}CdI_2$ is used to investigate the interaction between layers. (11 refs.)

101857 Response of liquid carbon disulfide to shock compression: equation of state at normal and high densities. S.A.Sheffield (Sandia Nat. Labs., Albuquerque, NM, USA), G.E.Duvall.
J. Chem. Phys. (USA), vol.79, no.4, p.1981-90 (15 Aug. 1983).
Liquid carbon disulfide (CS_2) is known to exhibit unusual behavior when it is shock compressed to pressures of approximately 6.0 GPa. This behaviour has been explained by either a phase transition to a 'black solid CS_2' or a decomposition chemical reaction. In order to learn more about the anomalous behavior as it relates to a shock-induced chemical reaction, it was necessary to develop equations of state for both the unreacted liquid and the reaction products. The paper describes the development of these equations of state along with comparisons of calculated Hugoniot information to measured data available in the literature. Both equations are based on the use of a Murnaghan isotherm relation (1951) along with assumed forms for specific heat and the Gruneisen parameter. Methods employed to match the calculations to the data in order to establish the values of various adjustable parameters are detailed. Temperature calculations are included although there is some uncertainty as to their accuracy because of lack of experimental temperature data. (35 refs.)

101858 Valence charge in a solid at 0K viewed as a pressure-ionization effect. B.K.Godwal (Neutron Phys. Div., Bhabha Atomic Res. Centre, Bombay, India).
Phys. Rev. A (USA), vol.28, no.2, p.1103-7 (Aug. 1983).
Modified Saha ionization theory has recently been used to obtain the dominant pressure and thermal ionization effects in the 'intermediate' region (0.5-10 TPa) of the equation of state. The present work is aimed at providing the justification for the use of this theory in the presence of interactions. The valence charges at 0K at normal density as determined using this theory are in very good agreement with their normal valence charges for a number of elements. The equation of state as computed from it is also in good agreement with the Thomas-Fermi-Dirac equation of state. Finally the theory is shown to simulate the valence transition under pressure in Eu and Yb. (19 refs.)

101859 Effect of the shell structure of atoms on the shock adiabats of aluminum and iron. A.F.Nikiforov, V.G.Novikov, V.B.Uvarov (M.V. Keldysh Inst. of Appl. Math., Acad. of Sci., Moscow, USSR).
Sov. Phys.-Dokl. (USA), vol.27, no.11, p.956-8 (Nov. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.1-3, p.615-18 (Nov. 1982).
Using the modified Hartree-Fock-Slater (MHFS) model, the authors calculated the equations of state of substances in a wide range of temperature and densities—for a rarefied and a dense gaseous plasma, and for solids. They compare the experimental data on shock compression of continuous aluminum and iron metal with the results of calculations using the MHFS model. The shock adiabat is determined by the Hugoniot relation. (15 refs.)

101860 Conditions of stationarity and stability of detonation waves in condensed media. V.A.Danilenko, V.M.Kudinov (E.O. Paton Inst. of Electrical Welding, Acad. of Sci., Kiev, Ukrainian SSR).
Sov. Phys.-Dokl. (USA), vol.27, no.11, p.975-7 (Nov. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.1-3, p.623-6 (Nov. 1982).
Presents some experimental results of an investigation of the stability of detonation waves in elongated charges of heterogeneous condensed media of different classes, as well as results from an inspection of the condition of stationarity and stability (CSS) of the detonation in elongated charges. The lengths l of the charges were chosen from the condition $l>l_{st}$, where l_{st} is the length at which the stationary and stable regime is attained. The behavior of detonation waves in charges of length not less than 3.5 d is identical to that in an arbitrarily long charge consisting of the same explosive. This identity permits the authors to apply the results obtained in studying detonations in charges of finite length to detonation waves in large-scale charges of arbitrary length. The possibility of predicting the behavior of detonation waves over long time intervals while studying their behavior over short time intervals follows from the CSS. (7 refs.)

62.60 ACOUSTIC PROPERTIES OF LIQUIDS

(see also 62.80 Ultrasonic relaxation; for sound propagation, see 43.; for second sound in quantum fluids, see 67.40, 67.50 and 67.60)

101861 Temperature dependence of acoustic velocity in benzene, toluene, acetone and chloroform on the basis of the Carnahan-Starling hard sphere equation. J.D.Pandey, K.Misra (Dept. of Chem., Univ. of Allahabad, Allahabad, India).
Acoust. Lett. (GB), vol.6, no.10, p.148-51 (April 1983).
The Carnahan-Starling rigid sphere equation has been used to calculate the acoustic velocity in benzene, toluene, acetone and chloroform at different temperatures. The agreement between the theoretical and experimental values is quite satisfactory, showing the validity of this model. (19 refs.)

101862 Ultrasonic study of tetrabutyltin in benzene, chlorobenzene, and dichloroethane. T.N.Srivastava, R.P.Singh (Dept. of Chem., Lucknow Univ., Lucknow, India).
Acoust. Lett. (GB), vol.6, no.10, p.152-7 (April 1983).
Ultrasonic wave propagation has been studied in binary mixtures of tetrabutyltin with benzene, chlorobenzene and dichloroethane, at 45°C and 55°C, using a single crystal ultrasonic interferometer at a frequency of 2 MHz. The

ultrasonic velocities and densities of the pure components and their mixtures have been used to calculate isentropic compressibility β, intermolecular free length, L_f, molar volume V, available volume Va and also the excess isentropic compressibility β^E, excess intermolecular free length L_f^E, excess molar volume V^E and excess available volume Va^E. The refractive indices for tetrabutyltin with benzene (25°C) and chlorobenzene (29.5°C) have also been measured. The systems studied show a nonideal behaviour, and the deviations from ideality have been explained on the basis of molecular interaction. (12 refs.)

101863 Ultrasonic absorption measurements near the critical point of a reactive binary mixture. H.Dunker, D.Woermann (Inst. fur Phys. Chem., Univ. Koln, Koln, Germany), J.K.Bhattacharjee.
Ber. Bunsenges. Phys. Chem. (Germany), vol.87, no.7, p.591-7 (July 1983).
Measurements of sound attenuation and velocity in the homogeneous phase near the critical mixing point of isobutyric acid and water have been carried out. The data are obtained by a pulse transmission technique at seven frequencies between 9 and 45 MHz in a temperature range between 26.29°C and 40°C. The experimental results are analysed in terms of a theory of critical ultrasonic absorption proposed by Bhattacharjee and Ferrell (1981). All the values of these parameters are known for the investigated system from independent experiments. The frequency dependence of the absorption coefficient of ultrasound at the critical temperature is in good agreement with this theory which takes into account only sound absorption by local concentration fluctuations. The absorption data obtained at temperatures away from the critical temperature do not scale when plotted as function of a reduced frequency given by the theory. This clearly indicates an additional mechanism causing absorption of ultrasound. This additional sound absorption can be represented by a single temperature dependent relaxation process. It is assumed that this process is due to an unspecified chemical reaction. The temperature dependence of the relaxation time follows a power law of the form $\tau_r \propto (T-T_c)^{-a}$ with $1 \leq a \leq 1.25$. (35 refs.)

101864 Rotational isomerism and ultrasonic relaxation in 1,2-dibromoethane. K.Takagi, P.-K.Choi, W.Seki (Inst. of Industrial Sci., Univ. of Tokyo, Tokyo, Japan).
J. Chem. Phys. (USA), vol.79, no.2, p.964-8 (15 July 1983).
Three different ultrasonic techniques, pulse echo, HRB (high-resolution Bragg reflection), and Brillouin scattering were used to measure the sound velocity and absorption in 1,2-dibromoethane at 11, 20, and 30°C over the frequency range from 3 MHz and 6 GHz. The observed results showed a typical spectrum for a single relaxation process, from which the relaxation frequency and strength were determined. The temperature dependence of the relaxation frequency and strength suggested that the activation energy for the gauche molecule is 3.0 ± 0.5 kcal/mol and that the energy difference is 1.3 ± 0.2 kcal/mol, respectively. The magnitude of the relaxation strength was successfully described by taking the effect of the volume change into account, and $\Delta V/V$ was estimated to be 0.05. (18 refs.)

101865 Oscillations in the ultrasonic velocity during heating of liquid gallium. V.M.Glazov, S.G.Kim (Moscow Inst. of Electronic Technol., Moscow, USSR).
JETP Lett. (USA), vol.37, no.5, p.245-7 (5 March 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.5, p.208-12 (5 March 1983).
High sensitive measurements have revealed oscillations in the temperature dependence of the ultrasonic velocity in liquid gallium. The oscillations are interpreted as a compressibility-oscillation effect and attributed to the particular nature of the interaction between the medium and microscopic regions in which the crystal structure has been partially retained. (6 refs.)

101866 Anisotropic propagation of ultrasound in the nematic phase of *N-p*-butoxybenzylidene-*p*-butylaniline with varying thermodynamic state parameters. V.A.Balandin, A.N.Larionov, S.V.Pasechnik (All-Union Correspondence Inst. of Mech. Engng., USSR).
Sov. Phys.-Acoust. (USA), vol.29, no.1, p.1-2 (Jan.-Feb. 1983). Translation of: *Akust. Zh. (USSR)*, vol.29, no.1, p.1-4 (Jan.-Feb. 1983).
The anisotropy of the absorption of ultrasound at a frequency of 2.9 MHz in the nematic phase of *N-p*-butoxybenzylidene-*p*-butylaniline is measured at various pressures. It is established that the anisotropy index of the given quantity in the vicinity of the nematic-smectic *A* phase transition is equal to −1.0 and does not depend on the pressure. (9 refs.)

(see also 62.80 Ultrasonic relaxation; for sound propagation, see 43.; for lattice dynamics and phonons, see 63.; for magnetoacoustic effects, see 72.55; for acoustoelectric effects, see 72.50; for acousto-optical effects, see 78.20H)

101867 The influence of the iron ions admixture and domain walls upon the propagation of longitudinal ultrasonic waves in TGS crystals. S.Szuba (Dept. of Experimental Phys., Higher Pedagogical School, Zielona Gora, Poland).
Acta Phys. Pol. A (Poland), vol.A64, no.1, p.39-53 (July 1983).
The velocity of propagation of longitudinal ultrasonic waves and their attenuation were measured in the three principal crystallographic directions of pure and Fe^{3+}-doped monocrystals of the concentration: $5\times10^{-4}\%$, $14\times10^{-4}\%$, $27\times10^{-4}\%$ and $36.10^{-4}\%$, in temperatures varying throughout the range of 293K-343K. The measurements for nonpolarized and permanently polarized samples were performed using the pulse echo technique with ultrasonic waves of the frequencies of: 9.8 MHz, 15.1 MHz and 29.4 MHz. On the basis of velocity and attenuation coefficient measurements, the relaxation time of spontaneous polarization and the size of lattice regions deformed by the introduction of foreign ions were determined. The velocity value and the value of the attenuation coefficient of the same, nonpolarized and permanently polarized, samples were compared. It was determined that in the vicinity of the phase transition in the ferroelectric phase, the attenuation coefficient value is lower for the single-domain samples than for the multi-domain ones, whereas the wave velocity value is higher for the single-domain samples than for the multi-domain ones. (21 refs.)

101868 Anisotropy of the sound absorption quantum oscillations in white tin. A.N.Vasil'ev, A.A.Nurmagambetov.
Fiz. Nizk. Temp. (USSR), vol.9, no.7, p.714-21 (July 1983). In Russian. English translation in: *Sov. J. Low Temp. Phys. (USA)*
The sound absorption quantum oscillations of different polarizations of the transverse sound waves in white tin are investigated by a transducerless method. A model is proposed, describing the anisotropy of the observed oscillations amplitudes. (12 refs.)

101869 Acoustic emission in the interaction of iron and its alloys with surface-active melts. M.A.Krishtal, A.A.Borgardt, P.V.Loshkarev (Polytech. Inst., Togliatti, USSR).
Sov. Phys.-Dokl. (USA), vol.27, no.11, p.977-9 (Nov. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.1-3, p.626-9 (Nov. 1982).
In the interaction of iron and iron-silicon alloys with surface-active melts of indium and lead a zone with a high density of dislocations is formed in a surface layer of the solid metal. To estimate that part of the released energy which is spent in the formation of the dislocation structure the authors have carried out a transmission-electron-microscope study of Armco-iron foil wetted by an indium melt for 1-2 sec. (6 refs.)

101870 A comparison of two theories of acoustoelasticity. A.V.Clark, R.B.Mignogna (Nondestructive Evaluation Section, Naval Res. Lab., Washington, DC, USA).
Ultrasonics (GB), vol.21, no.5, p.217-25 (Sept. 1983).
The presence of a plane stress field causes small changes in the phase velocities of orthogonally polarized SH waves. The (small) difference in phase velocities (birefringence) can be used for non-destructive stress measurement. However, material anisotropy can affect phase velocity to the same extent as stress. Two theories have been developed which account for the effect of both stress and anisotropy. The theory of Iwashimizu and Kubomura (1973) assumes isotropy in the third-order elastic moduli and anisotropy in second-order moduli. A different approach was taken by Okada (1980), who assumed the existence of a matrix analogous to the index of the refraction matrix in optics. In this paper, the authors generalize the theory of Iwashimizu and Kubomura by retaining anisotropy in third-order moduli. They show how Okada's theory can be made to agree with this more general theory. They also compare the predictions of the various theories with birefringence data obtained from uniaxial tension tests on 2024-T351 aluminium specimens. Both the Okada theory and the theory of Iwashimizu and Kubomura gave good agreement with experiment. (14 refs.)

62.80 ULTRASONIC RELAXATION

(see also 74.30G Ultrasonic attenuation in superconductors, 43.35 Ultrasonics)

101871 Ultrasonic relaxation of poly(*N*-vinylpyrrolidone) and dextran in aqueous solution. M.C.Pereira, P.L.Jobling, E.Wyn-Jones (Dept. of Chem. & Appl. Chem., Univ. of Salford, Salford, England), E.R.Morris, R.A.Pethrick.
J. Chem. Soc. Faraday Trans. II (GB), vol.79, pt.7, p.977-88 (July 1983).
The ultrasonic relaxation spectra of the polymers dextran and and poly(*N*J-vinylpyrrolidone) have been studied in aqueous solution over the frequency range 1-100 MHz. A range of molecular weights and concentrations were used to span dilute and semi-dilute solution conditions $(0.44<c[\eta]<11)$. The results indicate that the relaxation spectra can be resolved into two components, one associated with the viscoelastic normal mode of the polymer chain and the other a significant contribution associated with more local conformational changes within chain segments. 63.00 LATTICE DYNAMICS AND CRYSTAL STATISTICS

(see also 05.50 Lattice theory, 65. Thermal properties, 66.70 Thermal conduction, 68.30 Dynamics of surface and interface vibrations, 78.30 Infrared and Raman spectra)

63.10 GENERAL THEORY

101872 Solitons and next nearest neighbours coupling in 1-D anharmonic lattices. S.Pnevmatikos (Univ. de Dijon, Dijon, France).
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.14, p.1031-4 (18 April 1983). In French.
Supersonic and subsonic kink soliton solutions are found in the continuum limit of a discrete monoatomic chain for different harmonic or anharmonic coupling regimes between first and second nearest neighbours. The propagation of these solutions on the discrete chain is studied numerically, in particular for the competitive force case where some interesting lattice destabilisations are observed at the moment of the head-on collisions between two large amplitude solitary waves. (10 refs.)

63.20 PHONONS AND VIBRATIONS IN CRYSTAL LATTICES

101873 Determination of vibronic parameters for GR1 centre in diamond by an optimisation technique. S.Muramatsu (Dept. of Electronic Engng., Utsunomiya Univ., Utsunomiya, Japan).
J. Phys. C (GB), vol.16, no.24, p.4849-52 (30 Aug. 1983).
The parameters involved in vibronic models for the GR1 centre in diamond have been determined by using a optimisation technique. Two vibronic models and experimental data from optical measurements reported by Davies and Foy (1980) are used. The following values are obtained for the parameters of the Jahn-Teller coupling in the ground E and the excited T_2 states: $S_E=2.71$, $\beta/\alpha=1.36$, $S_T{}^e=0.22$ and $S_T{}^t=0.12$-0.14. The effective phonon energy for an e-mode vibration has been estimated to be 55 meV, which is close to the value of 40 meV obtained by Davies (1981) from a study of the emission spectrum. (10 refs.)

101874 Lattice dynamics and interaction potentials in molecular crystals. V.Schettino, S.Califano (Lab. di Spettroscopia Molecolare, Univ. di Firenze, Florence, Italy).
J. Mol. Struct. (Netherlands), vol.100, p.459-83 (July 1983).
Presents a critical analysis of harmonic and anharmonic calculations of crystal vibrations in the determination of intermolecular potentials. The main purpose is to show that the dynamical properties are specifically sensitive to different terms of the potential and thus that information extracted from vibrational spectra of crystals is of the greatest importance for the theory of intermolecular forces. The most important conclusion is that these calculations point to the development of anisotropic short-range potentials and orient future researches towards the more complex and elaborate anharmonic treatment of crystal vibrations. (36 refs.)

101875 Bound states of optical phonons for idealized models of crystal lattices. A.A.Anik'ev, V.S.Gorelik, B.S.Umarov.
Sov. Phys.-Lebedev Inst. Rep. (USA), no.10, p.41-6 (1982). Translation of: *Sb. Kratk. Soobshch. Fiz. AN SSSR Fiz. Inst. P.N. Lebedeva*, no.10, p.46-52 (1982).
It is shown that for the scalar model of a crystal, bound states of optical phonons are formed for certain definite values of the coupling constant. The calculated densities of states are compared with the experimental spectra of ammonium chloride crystals. (5 refs.)

63.20D Phonon states and bands, normal modes, and phonon dispersion

101876 Semiconductor dynamics from first principles: Phonons, forces, and dielectric properties. K.Kunc (Lab. de Phys. des Solides, Univ. Pierre et Marie Curie, Paris, France).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.559-68 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
Recent applications of 'direct' methods for ab initio treatment of dynamical properties of semiconductors are summarized with emphasis upon the author's own results based on the local density functional. Extending beyond the 'frozen phonon' approach, the applications include treatment of forces (in perfect structures and crystals with substitutional defects) and a 'direct' study of certain dielectric properties. (19 refs.)

101877 Effect of nonrandomness on the phonons in mixed $InP_{1-x}As_x$. G.Ahuja, H.C.Gupta, L.M.Tiwari (Phys. Dept., Indian Inst. of Technol., New Delhi, India).
J. Chem. Phys. (USA), vol.79, no.3, p.1416-18 (1 Aug. 1983).
A concentration dependent model using the effect of nonrandomness has been investigated to demonstrate the two-mode behavior of mixed crystals of the type $AB_{1-x}C_x$ having zinc-blend structure. The mixed crystal shows two-mode behavior for all the composition range and the pure crystal behavior at exact $x=0$ and at $x=1.0$. The model has been applied to $InP_{1-x}As_x$ to investigate the phonon dispersion curves in the symmetry directions. The results for $x=0$, $x=0.22$, $x=0.78$, and $x=1.0$ are found to be in agreement with experiment. (17 refs.)

101878 Phonons in uranium antimonide and uranium arsenide. W.G.Stirling, G.H.Lander (Inst. Laue-Langevin, Grenoble, France), O.Vogt.
J. Phys. C (GB), vol.16, no.21, p.4093-101 (30 July 1983).
The phonon dispersion curves of two rocksalt-structure uranium pnictides, USb and UAs, measured by neutron inelastic scattering, are presented. Both materials display marked anomalies in the disposition of certain branches, similar to those observed in some intermediate-valence compounds. The data are compared with the prediction of simple lattice dynamical models. (20 refs.)

101879 The relation between various coupling schemes for calculating nonradiative multiphonon transition rates. M.G.Burt (BTRL, Martlesham Heath, Ipswich, England).
J. Phys. C (GB), vol.16, no.21, p.4137-49 (30 July 1983).
In an earlier paper (see ibid., vol.15, p.L381, 1982) the author gave a simple proof that the static, adiabatic and intermediate coupling schemes give the same nonradiative multiphonon transition rates to leading order in the off-diagonal part of the electron-phonon interaction. In that proof, the time dependence in the interaction picture of the matrices describing the transformation from one representation to another was neglected using a heuristic argument. In this paper it is shown explicitly that this time dependence can be neglected, hence firmly establishing the earlier result. The equivalence between the various coupling schemes is also established for the time rate of change of a general observable; for example the charge density. The present work is discussed in relation to the recent papers by Peuker et al. (1982) and by Wagner (1982). In particular it is shown that there is no contradiction between the present work and that due to Wagner. It is also shown that Wagner's alternative adiabatic base is none other than the base defined by Condon electronic wavefunctions and displaced lattice oscillators and that this result holds independently of the strength of the off-diagonal part of the electron-phonon interaction. (11 refs.)

101880 Sagittal elastic waves in infinite and semi-infinite superlattices. B.Djafari-Rouhani, L.Dobrzynski, O.Hardouin Duparc (Lab. d'Etude des Surfaces et Interfaces, CNRS, Lille, France), R.E.Camley, A.A.Maradudin.
Phys. Rev. B (USA), vol.28, no.4, p.1711-20 (15 Aug. 1983).
Elastic waves, polarized in the sagittal plane, are investigated in infinite and semi-infinite superlattices made from alternate layers of two isotropic media. By the use of a transfer-matrix method, the authors obtain explicit equations for the dispersion of the bulk modes as well as of the surface modes of a semi-infinite superlattice. They present a few illustrations of the theory for Al-W superlattices in which the relative thicknesses of the two media or the thickness of the layer at the surface are varied. (31 refs.)

101881 Prediction of structures and magnetic orientations in solid α-and β-O_2. R.D.Etters (Natuurkundig Lab., Univ. van Amsterdam, Amsterdam, Netherlands), A.A.Helmy, K.Kobashi.
Phys. Rev. B (USA), vol.28, no.4, p.2166-71 (15 Aug. 1983).
A quasiharmonic-lattice-dynamics method coupled with a pattern-recognition optimization scheme is used to determine the minimum energy structures and magnetic orientations of solid oxygen. It is shown that the magnetic interaction is responsible for the stability of α-O_2 with respect to β-O_2 at zero temperature and pressure. The calculated α-O_2 lattice parameters, magnetic orientations, and sublimation energy are in good agreement with experiment. Phonon dispersion curves are calculated at $k\neq0$ and the acoustic sound velocities are determined. The root-mean-square translational and orientational fluctuations from equilibrium are also calculated. The β-O_2 phase is described by constraining the magnetic moments so that the magnetic Hamiltonian preserves the hexagonal symmetry of the crystal. The calculated lattice parameters are in good agreement with the experiment and a three-sublattice, quasihelical magnetic orientation is predicted from structural and energetic considerations. (30 refs.)

101882 Interlayer force and Davydov splitting in $2H$-MoS_2. P.N.Ghosh, C.R.Maiti (Dept. of Phys., Univ. of Calcutta, Calcutta, West Bengal, India).
Phys. Rev. B (USA), vol.28, no.4, p.2237-9 (15 Aug. 1983).
The atom-atom interaction model has been extended to the case of $2H$-MoS_2 and it is shown that the observed vibrational frequencies can be satisfactorily reproduced by only three force constants. However, the calculation leads to a frequency reversal in the Davydov pair which is very similar to that found earlier for ϵ-GaSe and β-GaS. Since MoS_2 is somewhat less ionic than the two gallium compounds, the authors suggest that the frequency reversal may not be due to the long-range interactions proposed earlier. They discuss the possible role of short-range multipolar interactions. (14 refs.)

101883 Near degeneracy surfaces and other implications of extended symmetry for phonons in alkali halide and other crystals. B.Segall, L.L.Foldy (Dept. of Phys., Case Western Reserve Univ., Cleveland, OH, USA).
Solid State Commun. (USA), vol.47, no.8, p.593-6 (Aug. 1983).
The role of extended symmetry in isobaric alkali halide crystal dynamics is examined with respect to: (i) further evidence for its validity, (ii) the prediction of the existence of surfaces of near degeneracies between pairs of phonon branches (subsequently confirmed by computer model simulation), (iii) more efficient parametrizations of phenomenological models for their phonon dynamics, and (iv) its usefulness in 'understanding' the characteristic features of the dispersion relations of all alkali halides. It is possible that the symmetry may be a useful concept for other classes of crystals as well. (12 refs.)

101884 Phonon dispersion curves of $CeSn_3$ in the vicinity of the *R*-point. L.Pintschovius (Inst. fur Angewandte Kernphys. I, Kernforschungszentrum Karlsruhe, Karlsruhe, Germany), E.Holland-Moritz, D.Wohlleben, S.Stahr, J.Liebertz, W.Assmus, C.Stassis, C.-K.Loong, S.Zarestky, R.M.Nicklow.
Solid State Commun. (USA), vol.47, no.8, p.663-4 (Aug. 1983).
The phonon dispersion curves of the intermediate valence compound $CeSn_3$ have been studied to check for the possible occurrence of an anomaly at the point *R*. The authors do not find any indication for an anomaly at this point, in agreement with present theories. (9 refs.)

63.20K Phonon-electron interactions

101885 Point-contact electron-phonon interaction spectra of pure metals. I.K.Yanson.
Fiz. Nizk. Temp. (USSR), vol.9, no.7, p.676-709 (July 1983). In Russian. English translation in: *Sov. J. Low Temp. Phys. (USA)*
The physical grounds of the electron-phonon interaction (EPI) spectroscopy by means of metallic-point-contacts with dimensions less than the electron mean free path are presented. At low temperature the volt-ampere characteristic of such a contact is nonlinear, its second derivative being proportional to the EPI function of the metal. The methods of preparation and qualification of the contacts are discussed. The experimental point-contact EPI functions for 26 metals are presented and compared with the various relative EPI functions and (or) with the phonon density of states. Such a comparison enables one to correct the phonon peak positions for a number of metals and reveals a tendency of emphasizing the transverse phonons in point-contact spectra. The tendency is explained by the overwhelming contribution of backscattering which involves transverse phonons mainly due to U-processes. The detailed comparison of the experimental and calculated point-contact EPI functions also yields the possibility to correct the pseudopotential form-factor taken as the input data in the theory. By integrating the point-contact spectra the EPI parameters λ_{pc} are calculated. (85 refs.)

101886 Localized surface modes and resonances for vicinal surfaces: the (117) face of FCC crystals. G.Armand (Service de Phys. des Atomes et des Surfaces, CENS, Gif-sur-Yvette, France), P.Masri.
Surf. Sci. (Netherlands), vol.130, no.1, p.89-123 (July 1983).
Considering the (117) face of an FCC crystal, the dispersion relations of localized surface modes and resonances have been calculated using the method of generating coefficients of Green functions. The force between atoms is limited to the central force between the nearest neighbours. In the direction of propagation orthogonal to a step, for each wavevector value, a localized surface mode and two resonances have been found. Their polarization amplitude and width have been calculated. It is shown that these results can be qualitatively understood by folding three times the dispersion relation of the (001) face which is the crystallographic plane of the terrace. In the direction parallel to the step, the dispersion relations are obtained by the superposition of the sagittal and transverse dispersion relation of the (001) face. The (117) configuration introduces a coupling between these two polarizations and some resonances appear. A general rule which enables one to predict qualitatively the shape of the dispersion relation for any vicinal surface of type (11m) is expressed. (22 refs.)

63.50 VIBRATIONAL STATES IN DISORDERED SYSTEMS

101887 Lattice dynamics of polyacetylene as a one-dimensional system. I. The case of the trans perfect polymer. G.Zannoni, G.Zerbi (Dipartimento di Chimica Industriale e Ingegneria Chimica, Politecnico di Milano, Milano, Italy).
J. Mol. Struct. (Netherlands), vol.100, p.485-504 (July 1983).
The lattice dynamics of trans-polyacetylene as a perfect one-dimensional crystal is treated. Dispersion curves, density of states and vibrational displacements are calculated. The results of the calculations are used to propose a vibrational assignment for $(CH)_x$, $(CD)_x$ and $(^{13}CH)_x$. Calculations have been made with a quadratic simplified valence force field (SVFF). The relationship between SVFF and the electron-phonon coupling model for polyacetylene, generally adopted in the literature, is discussed. Comparison with the calculations of other authors is made. (71 refs.)

101888 Lattice dynamics of polyacetylene as a one-dimensional system. II. Doping-induced disorder. G.Zannoni, G.Zerbi (Dipartimento di Chimica Industriale e Ingegneria Chimica, Politecnico di Milano, Milano, Italy).
J. Mol. Struct. (Netherlands), vol.100, p.505-30 (July 1983).
For pt.I see ibid., vol.100, p.485 (1983). The quadratic valence force field derived in part I of this study for perfect trans-polyacetylene is used and adapted for the study of the doping-induced IR absorption of polyacetylene. The lattice dynamics of a one-dimensional disordered system is treated with the introduction of structural defects to represent the doping sites. Concentration, distribution, size of the defects and inhomogeneity of the doping are all considered. Two models for the defects are analyzed; one representing the 'soliton' and the other, equally acceptable on chemical grounds, representing centro-symmetric defects. It is concluded that the IR spectrum observed for doped polyacetylene does not provide unequivocal evidence for the existence of solitons. Alternative explanations are equally acceptable from the spectroscopic viewpoint. The structural information derived from lattice dynamics and spectra is discussed in detail. (55 refs.)

101889 Establishment of temperature in dielectric glasses below 1K. I.B.Levinson (L.D. Landau Inst. of Theoretical Phys., Acad. of Sci., Moscow, USSR).
JETP Lett. (USA), vol.37, no.3, p.190-3 (5 Feb. 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.3, p.157-9 (5 Feb. 1983).
The process of establishing the temperature in a system of two-level centres+phonons is discussed. It is shown that the time for establishing the temperature is very large (at $T \simeq 0.2K$ it is about 10 ms). (14 refs.)

101890 Debye-Waller factors and the study of structural phase transitions: double quadratic chain. S.L.Mair (Div. of Chem. Phys., CSIRO, Clayton, Victoria, Australia).
J. Phys. C (GB), vol.16, no.24, p.4811-25 (30 Aug. 1983).
Expressions for the one-particle density function and Debye-Waller factor are derived for a chain of atoms, each atom sitting in a double quadratic one-particle potential, with adjacent atoms linked by strong harmonic coupling forces. Working within the framework of classical mechanics, exact numerical results are obtained and compared with analytical expressions which are exact at zero temperature but only approximate at finite temperature. It is shown that the pseudo-Schrodinger and transfer integral equations give essentially the same results at all temperatures. The one-particle density function at low temperature consists of two equally weighted gaussians, corresponding to phonon-like modes about the local minima in the potential. As the temperature increases a centrally placed soliton peak grows and dominates the distribution at high temperatures. The mean-square displacement is linear at high temperatures and linear extrapolation back to zero temperature gives a positive intercept on the mean-square displacement axis. These results are discussed in the context of the disorder model and experimental DWF data from structurally transforming crystals. (18 refs.)

63.90 OTHER TOPICS IN LATTICE DYNAMICS AND CRYSTAL STATISTICS

101891 Frequency spectrum of a small particle. A.Tamura, T.Ichinokawa (Dept. of Appl. Phys., Waseda Univ., Tokyo, Japan).
J. Phys. C (GB), vol.16, no.24, p.4779-88 (30 Aug. 1983).
On the basis of an elastic body approximation, the frequency spectrum is derived for the small particle having a relaxed surface layer. Three quantities—the maximum angular momentum and two maximum eigenfrequencies defined for the spheroidal mode and the torsional mode—are introduced to reflect the atomicity of a real lattice structure. The calculated frequency spectrum for a small Ar particle is in good agreement with that obtained by the molecular dynamical method. The size dependence of the frequency spectrum shows that the relative importance of the surface modes to the inner

modes becomes large as the particle size decreases. The surface relaxation effect changes the peak positions of the frequency spectrum derived for the small particle without a relaxed surface layer. The present treatment is applicable to a small particle having a considerable number of atoms, more than 1000. (15 refs.)

101892 Equation-of-state data for molecular hydrogen and deuterium at shock pressures in the range 2-76 GPa (20-760 kbar). W.J.Nellis, A.C.Mitchell, M.van Thiel, G.J.Devine, R.J.Trainor (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA), N.Brown.
J. Chem. Phys. (USA), vol.79, no.3, p.1480-6 (1 Aug. 1983).
Dynamic equation-of-state data for D_2 and H_2 were measured in the pressure range 2-76 GPa (20-760 kbar) using a two-state light-gas gun. Liquid specimens were shocked from initial states near the saturation curve at 20K. Maximum compression was sixfold over initial liquid density at a calculated temperature of 7000K for D_2. The data is discussed in terms of the theory of Ross et al. (1983) which includes an effective intermolecular pair potential, molecular vibration, free molecular rotation, and molecular dissociation. (33 refs.)

101893 The equation of state of molecular hydrogen at very high density. M.Ross, F.H.Ree, D.A.Young (Lawrence Livermore Nat. Lab., Univ.of California, Livermore, CA, USA).
J. Chem. Phys. (USA), vol.79, no.3, p.1487-94 (1 Aug. 1983).
In the preceding paper (Nellis et al., ibid., vol.79, no.3, p.1480, 1982) new shock-wave results were reported on liquid hydrogen and deuterium up to a pressure of 76 GPa (760 kbar). In the present paper an effective pair potential is determined from these results and used in calculations of fluid and solid isotherms, melting curves, and the metallic transition pressure. The agreement with available data is good and the metallic transition is predicted to be near 300 GPa (3 Mbar). (46 refs.)

101894 Reduced van der Waals equation of state and critical properties of rubbers. Th.Vilgis, H.-G.Kilian (Abteilung Experimentelle Phys., Univ. Ulm, Ulm/Donau, Germany).
Polymer (GB), vol.24, no.8, p.949-52 (Aug. 1983).
A reduced equation of state describing the deformation mode as simple elongation is derived for van der Waals networks, thus manifesting general relationships for molecular networks also embracing their stability characteristics and the occurrence of a phase transition. (20 refs.)

64.60 GENERAL STUDIES OF PHASE TRANSITIONS

(for critical phenomena in quantum fluids, superconductors, magnetic materials and ferroelectrics, see 67., 74.40, 75.40 and 77.80 respectively)

101895 Incommensurate crystal phases. A.Janner, T.Janssen (Inst. for Theoretical Phys., Univ. of Nijmegen, Nijmegen, Netherlands).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.665-75 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
The authors explore how the superspace description of an incommensurate modulated crystal can be used for investigating crystal phase transitions. The superspace group approach is explained briefly. The relevant ideas and results of two specific one-dimensional microscopic models leading to phase diagrams involving incommensurate crystal structures are then briefly reviewed. The same models are subsequently considered again but in a superspace-adapted formulation, the advantage of the approach being more that of a symmetry-adapted formulation than that of a group-theoretical one of the crystallographic superspace symmetry occurring in these models. In order to investigate the latter aspect as well, the classical theory of Landau for continuous phase transitions is considered and extended to allow the use of superspace symmetry as present in incommensurate crystals. Such an extension is presented, which allows one to characterize second-order phase transitions involving incommensurate phases as well, even when different modulation dimensionalities (the so-called internal dimensions) or commensurate phases occur. (10 refs.)

101896 Commensurate-incommensurate phase transitions. V.L.Pokrovsky (Landau Inst. of Theoretical Phys., Chernogolovka, USSR).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.677-87 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
Phase transitions from commensurate to incommensurate state (CIT) were observed in numerous physical systems, including: heliomagnets; helical ferroelectrics; chiral smectics; charge density waves; spin density waves; submonolayers of adsorbed atoms on crystal faces; atoms and molecules intercalated into graphite; reconstructed faces of crystals and interfaces; superconducting films with modulated thickness in transverse magnetic field and electrons on liquid He surface over a periodic electrode. The soliton interactions are discussed, as are the soliton structures in anisotropic and isotropic systems. Finally, point defects in commensurate and striped soliton structures in two dimensions, and the effects of discreteness are outlined. (35 refs.)

101897 Line effects in disk-shaped heterogeneous nucleation. G.Navascues, L.Mederos (Inst. de Fisica del Estado Solido, Univ. Autonoma de Madrid, Madrid, Spain).
J. Chem. Phys. (USA), vol.79, no.4, p.2006-8 (15 Aug. 1983).
The classical theory of the heterogeneous nucleation with disk-shaped nuclei is developed and discussed. The nonlinearity of the Pound plot can be understood with the present theory, in which line tension effects play an essential role. Experimental data on the nucleation of zinc depositing on glass is analyzed in the light of the theory; these data can be theoretically fitted for the first time over a full range of temperatures assuming plausible values for the unknown parameters. (17 refs.)

101898 Long-range interactions in commensurate-incommensurate phase transition. V.L.Pokrovsky (L.D. Landau Inst. for Theoretical Phys., Chernogolovka, USSR), A.Virosztek.
J. Phys. C (GB), vol.16, no.23, p.4513-25 (20 Aug. 1983).
The influence of long-range interactions between particles on the commensurate-incommensurate phase transition is investigated. The local theory (Landau theory, elasticity theory) is shown to be invalid at large distances. The effectiveness of different long-range interactions is examined. The electrostatic forces appear to be ineffective in three dimensions. A new resonance phenomenon is predicted for the longitudinal incommensurate structure. (18 refs.)

101899 The decay of correlation of the two-particle distribution function in a phase-separating layer and the possibility of spatial phase coexistence. M.Requardt (Inst. fur Theoretische Phys., Univ. Gottingen, Gottingen, Germany).
J. Stat. Phys. (USA), vol.31, no.3, p.679-89 (June 1983).
The author studies the decay of correlation of the two-particle distribution function in a plane phase separating layer (e.g. a liquid in coexistence with its vapor). It is argued that the decay may be poorer in this special case than in the more general situation of interfaces of arbitrary shape. The clustering is shown to be weaker than $|x-y|^{-(d-2)}$, d the space dimension, in contrast to the more general situation. In particular, it is shown that this poor clustering is entirely restricted to the interface itself. This stronger result allows one to prove as a by-product the nonexistence of a plane interface in two dimensions. Furthermore, the author makes some remarks concerning the physical consequences like, e.g., the degree of particle number fluctuations and the behavior of the compressibility in the interface. The results do hold for two-particle potentials of short range. (23 refs.)

101900 Flow of superfluid ^{3}He through micrometer-size channels. M.T.Manninen, J.P.Pekola (Low Temperature Lab., Helsinki Univ. of Technol., Espoo, Finland).
J. Low Temp. Phys. (USA), vol.52, no.5-6, p.497-525 (Sept. 1983).
Measurements of the critical mass current J_c through 0.8-μm-diameter channels in the superfluid phases of ^{3}He are reported. Experiments were made at pressures from 0 to 27.4 bar in zero external magnetic field. The pressure difference ΔP along the flow channels is immeasurable within the authors' resolution of ± 0.1 μbar for sufficiently low currents in both the A and B phases, implying small or zero dissipation. In the B phase ΔP grows rapidly with increasing current above J_c. At low pressures J_c behaves like $(1-T/T_{cyl})^{3/2}$, where T_{cyl} is interpreted as the reduced superfluid transition temperature inside the flow channels; $T_{cyl}/T_c=0.935$ at $P=0$. If the liquid in the channels is in the A phase, the behavior of ΔP vs. the mass current J_s depends on the phase A or B outside the channels. During warming a drop of about 30% in J_c is found at T_{BA}(cyl) and T_{BA}(cyl) is the reduced $B \rightarrow A$ transition temperature in the channels. Above T_{BA} a second dissipation mechanism, with a smaller $d(\Delta P)/dJ_s$, is observed at lower currents. These features indicate that in the A phase the ends of the channels have an important effect on the flow. (38 refs.)

101901 Phase equilibrium in nearly monodisperse fluids. J.M.Kincaid, G.Morrison, E.Lindeberg (Thermophys. Div., NBS, Washington, DC, USA).
Phys. Lett. A (Netherlands), vol.96A, no.9, p.471-4 (1 Aug. 1983).
The two-phase equilibrium and critical point conditions of a polydisperse fluid (a mixture with a continuous distribution of components) are solved by making power-series expansions about the properties of a single representative species. (8 refs.)

101902 Octahedrally coordinated cation superlattices in spinels. V.I.Mal'tsev, M.F.Zhorovkov (V.D. Kuznetsov Physicotech. Inst., Tomsk State Univ., Tomsk, USSR).
Sov. Phys. J. (USA), vol.25, no.11, p.1025-9 (Nov. 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.11, p.57-62 (Nov. 1982).
Static concentration waves have been used to determine all physically nonequivalent superlattices for octahedrally coordinated cations in spinels related to Lifshits (000) and {(100), (010), (001)} stars. These superlattice exhaust the types of cation ordering in the octahedral sublattice for spinels at present known. The nature of the order-disorder transition has been determined for these superlattices, and equilibrium equations have been derived that define the temperature dependence of the degree of long-range order. (9 refs.)

101903 Corresponding states correlations of the spinodal and homogeneous nucleation limits. J.H.Lienhard (Mech. Engng. Dept., Univ. of Houston, Houston, TX, USA).
Trans. ASME. J. Heat Transfer (USA), vol.104, no.2, p.379-81 (May 1982).
The scarcity of high-pressure specific volume and surface tension data that appear in predictions of homogeneous nucleation (or of the spinodal limit) in liquids, often makes their evaluation difficult or impossible. The author shows how these predicted limits can easily be developed from corresponding state correlations. (15 refs.)

101904 Phase diagram features associated with multicritical points in alloy systems. S.M.Allen (Dept. of Materials Sci. & Engng., MIT, Cambridge, MA, USA), J.W.Cahn.
Alloy Phase Diagrams. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.195-210
Many features in the vicinity of critical points in phase diagrams can be illustrated using a Landau type free energy expansion as a power series in one or more order parameters and composition. This simple approach can be used with any solution model. It also predicts limits to metastability, and is useful for understanding mechanisms of phase change. The theory is applied to all the critical points that can occur in binary systems according to a Landau theory: critical consolute points, order-disorder transitions, tricritical points, critical end points, as well as to systems in which two transitions such as chemical and magnetic ordering occur. 64.70 PHASE EQUILIBRIA, PHASE TRANSITIONS, AND CRITICAL POINTS

(see also 81.30 Phase diagrams and microstructures developed by solidification and solid-solid phase transformations)

101905 Phase diagram of oxygen up to 13 GPa and 500K. T.Yagi, K.R.Hirsch, W.B.Holzapfel (Univ.-GH Paderborn, Paderborn, Germany).
J. Phys. Chem. (USA), vol.87, no.13, p.2272-3 (23 June 1983).
The phase diagram of oxygen has been determined to pressures of 13 GPa and at temperatures between 300 and 500K. The melting temperatures are higher than previously reported and the α' phase is found to extend to higher temperatures than expected from previous work. These differences are attributed to laser heating in the previous work. (9 refs.)

101906 The $TlCl/PbCl_2$ system. H.-L.Keller (Inst. fur Anorganische Chem., Christian-Albrechts-Univ. Kiel, Kiel, Germany).
J. Solid State Chem. (USA), vol.48. no.3, p.346-50 (15 July 1983). In German.
A reinvestigation of the *x-T* diagram was performed using DTA and X-ray techniques. Four compounds exist in the system of $TlCl/PbCl_2$. The transformations of Tl_3PbCl_5 and $TlPb_2Cl_5$ are discussed. The compound Tl_2PbCl_4 exists only within a temperature interval of about 20°C. A compound of the formula $Tl_7Pb_3Cl_{13}$ is reported for the first time. Crystallographic data of $TlPb_2Cl_5$, high and low Tl_3PbCl_5 and $Tl_7Pb_3Cl_{13}$ are presented. (20 refs.)

101907 Defect structures in the brannerite-type vanadates. V. Phase diagram of the pseudo-ternary MnV_2O_6-$LiVMoO_6$-MoO_3 system comprising the $Mn_{1-x-y}Li_yO_xV_{2-2x-y}Mo_{2x+y}O_6$ solid solution. J.Ziolkowski, K.Krupa, K.Mocala (Inst. of Catalysis & Surface Chem., Polish Acad. of Sci., Krakow, Poland).
J. Solid State Chem. (USA), vol.48, no.3, p.376-87 (15 July 1983).
For pt.IV see ibid., vol.39, p.271 (1982). The phase diagram of the pseudo-ternary MnV_2O_6-$LiVMoO_6$-MoO_3 system has been determined with DTA and X-ray phase analysis. Its outstanding feature is the very large range of stability of the quaternary solid solution α-MLØ described by the formula $Mn_{1-x-y}Li_y\O_xV_{2-2x-y}Mo_{2x+y}O_6$ (Ø=cation vacancy), and crystallizing in the monoclinic brannerite-type structure. In this solution y may vary between 0 and 1, which corresponds to the entire miscibility of MnV_2O_6 and $LiVMoO_6$; x may change between 0 and x_{max} depending on y (if, e.g., y equals 0.00, 0.40, 0.84, or 1.00, x_{max} is 0.45, 0.28, 0.16, or 0.00, respectively). Depending on composition, α-MLØ is stable up to 540-710°C. Other features of the diagram, including the liquidus, are described in detail. The dependence of unit cell dimensions on composition of α-MLØ has been determined On passing from MnV_2O_6 to $LiVMoO_6$, the lattice parameter b and unit cell volume increase, c and $c \sin \beta$ decrease, and a changes insignificantly. These changes are interpreted by taking into account the ionic radii of the components and the specific details of the brannerite-type structure. MLØ solid solutions were prepared using the amorphous citrate precursor method. (19 refs.)

101908 The system copper-tellurium. R.Blachnik, M.Lasocka, U.Walbrecht (Anorganische Chem., Univ. GH-Siegen, Siegen, Germany).
J. Solid State Chem. (USA), vol.48, no.3, p.431-8 (15 July 1983).
The system copper-tellurium was investigated by DTA, DSC, and X-ray methods. A phase diagram with the phases $Cu_{2-x}Te$ (33.5-36.2 mole% Te), $Cu_{3-x}Te_2$ (40-41 mole%), and CuTe was constructed. In the homogeneity ranges of the nonstoichiometric phases several superstructures were observed. The lattice parameters and d values of some of these phases are given. (22 refs.)

101909 Contribution to the study of Pb-Bi-Te. Study of the $PbTe$-Bi_2Te_3 system. R.Chami, G.Brun, J.-C.Tedenac, M.Maurin (Univ. des Sci. et Tech. du Languedoc, Montpellier, France).
Rev. Chim. Miner. (France), vol.20, no.3, p.305-13 (1983). In French.
The system $PbTe$-Bi_2Te_3 was studied by DTA, microstructure and X-ray examination. The analysis of the diagram shows in the range $(PbTe)_{1-x}(Bi_2Te_3)_x$ $(0<x<0.12)$ the existence of a solid solution of PbTe structural type. $PbBi_2Te_4$ (PbTe, Bi_2Te_3) melts incongruently at 583°C and $PbBi_4Te_7$(PbTe, $2Bi_2Te_3$) decomposes before melting in to $PbBi_2Te_4+Bi_2Te_3$ at about 570°C, very near the eutectic reaction temperature. (7 refs.)

101910 SnS_2-Tl_2S section of the thallium-tin-sulphur system. A.-L.Ajavon, R.Eholie (Univ. de Cote-d'Ivoire, Abidjan, Ivory Coast), Y.Piffard, M.Tournoux.
Rev. Chim. Miner. (France), vol.20, no.3, p.421-25 (1983). In French.
The SnS_2-Tl_2S section of the Tl-SnS system has been studied by DTA and X-ray diffraction. Three new phases have been obtained: $Tl_4Sn_5S_{12}$, Tl_2SnS_3 and Tl_4SnS_4. The peritectic decomposition of $Tl_4Sn_5S_{12}$ is observed at 457±5°C. The congruent melting points of Tl_2SnS_3 and Tl_4SnS_4 are respectively 420±5°C and 450±5°C. The symmetry and cell dimensions of the three phases have been determined from single crystal photographs. (2 refs.)

101911 Heats of interaction of polyvinyl chloride with plasticizers, kinetics of swelling and phase equilibrium. A.A.Tager, Yu.S.Bessonov, T.V.Ikanina, T.A.Rodionova, A.I.Suvorova, S.A.El'boim.
Vysokomol. Soedin. Ser. A (USSR), vol.25, no.7, p.1444-50 (July 1983). In Russian. English translation in: *Polym. Sci. USSR (GB)*
The complete phase diagrams of PVC-dibutyl phthalate and PVC-tricresylphosphate systems have been obtained, their glass transition temperatures have been found and the heats of swelling of PVC in cyclohexane and six commercial plasticizers have been determined. At room temperature the interaction of PVC with plasticizers is accompanied by essential exothermic effects, decreasing in the 20-40° temperature range. This fact is in agreement with literature data on the temperature dependence of the elasticity modulus of these systems and confirms the concept of the relation of 'antiplasticization' with strong energetic interactions. (15 refs.)

101912 Ab-initio calculations of phase diagrams of binary simple-metal alloys. J.Hafner (Inst. fur Theoretische Phys., Tech. Univ. Wien, Wien, Austria).
Alloy Phase Diagrams. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.1-15
The combined application of electronic and thermodynamic perturbation theories allows for an ab-initio calculation of the phase diagrams of binary simple-metal alloys. (58 refs.)

101913 Cohesion, compound formation and phase diagrams from first principles. A.R.Williams, C.D.Gelatt,Jr., J.W.D.Connolly, V.L.Moruzzi (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA).
Alloy Phase Diagrams. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.17-28
The physical picture of cohesion and compound formation provided by parameter-free self-consistent energy-band calculations is described. For transition-metal elements, the calculations allow one to 'see' which electrons are holding the solid together and which are holding it apart. For compounds, calculated heats of formation agree well with available measurements and are in general agreement with those given by Miedema's empirical formula. (The agreement with Miedema is paradoxical, in that Miedema's conception of the formation process differs qualitatively from that of the authors.) Preliminary, but very encouraging, results of efforts to extend the analysis to disordered materials and to the calculation of phase diagrams are described. (18 refs.)

101914 Theory of surface effects in binary alloys. J.L.Moran-Lopez (Dept. de Fisica, IPN, Mexico City, Mexico), L.M.Falicov.
Alloy Phase Diagrams. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.29-42
The chemical, ordering and magnetic properties of binary alloys at the surface are examined in terms of a model of pairwise interacting atoms. Both the case of segregating alloys and the case of alloys which form intermetallic compounds are examined. Some surprising results about surface concentration and surface ordering are found. Applications to a number of systems, including ferromagnets, are presented. (44 refs.)

101915 Quantitative predictions from solid-state physics—what do phase diagram calculators want?. M.Rand (AERE, Harwell, Didcot, England).
Alloy Phase Diagrams. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.81-92
The types of information required for the calculation of phase diagrams are discussed by considering the computation of typical ternary sections from the constituent binary systems. Such calculations require knowledge of the Gibbs energy of transformation (lattice stabilities) and Gibbs energies of mixing of wholly metastable, as well as the stable phases in the binary systems. Similarly, the stabilities of metastable compounds such as Fe_7C_3 would be required for computations in the C-Cr-Fe system. These requirements are compared to the information provided by solid-state theoreticians. Essentially such calculations provide enthalpy values at 0K (or some unspecified temperature for semi-empirical models); however the lattice dynamics and configurational entropy of simple phases have been included in some recent computations. The importance of predicting the entropy and thus heat capacity of metallic phases—particularly metastable phases—is therefore emphasized. Identification of those contributions to the heat capacity which are responsible for the differences between metal polymorphs is discussed, particularly the formalism for magnetic and atomic ordering phenomena. (29 refs.)

101916 Structural maps and parameters important to alloy phase stability. R.E.Watson (Brookhaven Nat. Lab., Upton, NY, USA), L.H.Bennett.
Alloy Phase Diagrams. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.99-104
Alloy properties are often summarized on two-dimensional maps. For instance, Darken and Curry related the terminal solubilities of alloy systems to two coordinates (the differences in electronegativities and in atomic radii of the alloy constituents). Maps are considered here which correlate the structures in which the compounds form as well as providing some indication of whether a compound forms at some given composition in the first place. This class of map involves one coordinate which is the difference in an atomic parameter (here it will be taken to be the electronegativity) while the other is an average (in this case the d-band hole count). This contrasts with Darken-Gurry maps and Giessen's maps related to glass-forming ability where both coordinates are differences. The situation for 50/50 transition metal alloys is reviewed and results are presented for system off 50/50 composition. (12 refs.)

64.70D Solid-liquid transitions

(see also 81.30F Solidification)

101917 Pulsed neodymium: yttrium aluminum garnet laser (532 nm) melting of crystalline silicon: experiment and theory. D.H.Lowndes, R.F.Wood, R.D.Westbrook (Solid State Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
Appl. Phys. Lett. (USA), vol.43, no.3, p.258-60 (1 Aug. 1983).
Time-resolved reflectivity measurements have been used to determine both the time of onset-of-melting and the duration of melting resulting from frequency-doubled neodymium: yttrium aluminum garnet (532 nm) pulsed-laser irradiation of crystalline silicon. Substantially shorter surface melt durations were obtained with increasing energy density E_1 than were reported earlier by others. Thermal melting model calculations, which take into account the temperature dependent optical and thermal properties of silicon, are in substantial agreement with the observed E_1 dependence of the onset of melting and surface melt duration. Inclusion of intensity dependent absorption in the modeling further improves this agreement. (17 refs.)

101918 Melting of two-dimensional solids. R.H.Morf (RCA Ltd., Zurich, Switzerland).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.743-54 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
Experiments and computer simulation studies on two-dimensional melting are reviewed. Results are compared with predictions based on the theory of dislocation-mediated melting. (38 refs.)

101919 Freezing transition phenomena far from equilibrium. J.H.Bilgram (Lab. fur Festkorperphys., Eidgenossische Tech. Hochschule, Zurich, Switzerland).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.863-73 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
The freezing transition of H_2O and salol has been studied in experiments where the solid-liquid interface is continuously driven into the melt. The dynamics of entropy fluctuations in a layer between the crystal and the melt are for H_2O about 5 orders of magnitude slower than in the bulk melt (for salol 6 orders of magnitude). Solidification rates are calculated, based on the Wilson-Frenkel model. They are determined by the same processes as the dynamics of entropy fluctuations in the interface layer. Decay rates of these fluctuations have been calculated using experimentally determined solidification rates. The calculated values agree with those determined in light-scattering experiments within the accuracy of the experiments. (12 refs.)

101920 Densities and partial molar volumes of supercooled aqueous solutions. C.M.Sorensen (Dept. of Phys., Kansas State Univ., Manhattan, KS, USA).
J. Chem. Phys. (USA), vol.79, no.3, p.1455-61 (1 Aug. 1983).
Density measurements of aqueous solutions of ethanol, *t*-butanol, and hydrazine in the temperature range from 50° down to nucleation are presented. From these data, solute partial molar volumes and temperatures of maximum density are determined. The partial molar volumes of the alcohol solutions at low concentration become small below -30°C, and the characteristic minimum in the partial molar volume vs concentration curve vanishes. The hydrazine solutions display similar behavior except no minimum is observed. It is also found that the temperature of maximum density washes out at finite concentrations and solutions with higher concentration do not seem to nucleate but may be forming glasses. These results are discussed in terms of a liquid clathrate structural model of water which becomes multiply connected to fill all space as the water is supercooled. (25 refs.)

101921 Pulsed RF emission during crystallization of water and certain dielectrics. L.G.Kachurin, S.Kolev, V.F.Psalomshchikov (Hydrometeorological Inst., Leningrad, USSR).
Sov. Phys.-Dokl. (USA), vol.27, no.11, p.937-9 (Nov. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.1-3, p.347-50 (Nov. 1982).
The authors present a study of the electromagnetic radiation which accompanies thermodynamically irreversible crystallisation of water and other dielectrics. The apparatus used is an improved version of that used for measuring interphase crystallisation potentials. The electric and magnetic components of the RF field in the band from 20 Hz to 10 MHz. (8 refs.)

101922 Inward melting in a vertical tube which allows free expansion of the phase-change medium. E.M.Sparrow, J.A.Broadbent (Dept. of Mech. Engng., Univ. of Minnesota, Minneapolis, MN, USA).
Trans. ASME. J. Heat Transfer (USA), vol.104, no.2, p.309-15 (May 1982).
Experiments on the melting of a phase-change medium in a vertical tube yielded quantitative results both for the heat transfer and the timewise evolution of the melting front. The upper surface of the phase-change medium was bounded by an insulated air space, which accommodated the volume changes which accompany the melting process. Numerical solutions based on a pure conduction model were also performed for comparison purposes. It was found that the rate of melting and the heat transfer are significantly affected by fluid motions in the liquid melt induced by the volume change and by natural convection, with the former being significant only at early times. For melting initiated with the solid at the phase-change temperature, the experimentally determined values of the energy transfer associated with the melting process were about 50 percent higher than those predicted by the conduction model. Furthermore, the measured values of the energy stored in the liquid melt were about twice the conduction prediction. A compact dimensionless correlation of the experimental results was achieved using the Fourier, Stefan, and Grashof numbers. Initial subcooling of the solid substantially decreased the rate of melting, with corresponding decreases in the energy transfers for melting and sensible heat storage. (6 refs.)

101923 Transient freezing of a liquid in a convectively cooled tube. M.S.Sadeghipour, M.N.Ozisik, J.C.Mulligan (Dept. of Mech. & Aerospace Engng., North Carolina State Univ., Raleigh, NC, USA).
Trans. ASME. J. Heat Transfer (USA), vol.104, no.2, p.316-22 (May 1982).
The transient freezing of a liquid in laminar flow inside a circular tube subjected to convection heat transfer on the external surface is investigated analytically. The effects of Biot number, fluid inlet temperature, and the external ambient temperature on the length of this freeze-free zone are illustrated. The variation of the thickness of the freeze layer as a function of time and position along the tube is determined. (13 refs.)

101924 Pressure effect on nucleation during crystallization from the melt of oligoesters of various molecular mass. V.P.Privalko, A.N.Sharov.
Vysokomol. Soedin. Ser. A (USSR), vol.25, no.7, p.1419-25 (July 1983). In Russian. English translation in: *Polym. Sci. USSR (GB)*
The kinetics of volume crystallization from the melt of two samples of oligoethylene glycol adipate with various MM has been studied in the 15.8-112.4 MPa pressure range in the isobaric-isothermal regime. The increase of pressure is shown to retard the rate of crystallization due to the enhancing of the energetic barrier to nucleation. The mechanism of crystallization of oligoesters is discussed. (20 refs.)

101925 On the crystalline, liquid, glassy, gaseous, and superfluid states of simple substances. R.M.J.Cotterill (Dept. of Structural Properties of Materials, Tech. Univ. of Denmark, Lyngby, Denmark).
Physics of Superionic Conductors and Electrode Materials. Proceedings of a NATO Advanced Study Institute on the Physics of Superionics Conductors and Electrode Materials, Odense, Denmark, 4-22 Aug. 1980 (New York, USA: Plenum Press 1983), p.79-92
The objective of this brief review is to provide a commentary on some current developments in the quest to explain the different states of simple matter within the framework of a single approach. The article first touches briefly on some recent evidence against dislocation-mediated melting, in three dimensions, and then discusses the free volume and bifurcation approaches to the glass-liquid and crystal-liquid transitions. Contact is then made with the interesting limiting case of the hard sphere model, and the penultimate section includes a few qualitative remarks on the bifurcation theory of superfluidity. 64.70F Liquid-vapour transitions

101926 On the limit of superheat of cryogenic liquids. K.Nishigaki, Y.Saji (Kobe Univ. of Mercantile Marine, Kobe, Japan).
Cryogenics (GB), vol.23, no.9, p.473-6 (Sept. 1983).
In an effort to test the empirical law governing the scaled superheat-limit, the authors measured superheated neon and hydrogen with special emphasis on the critical superheat. Experimental results were compared with a Doring-Zeldovich-like nucleation theory and satisfactory agreement was found. Some deviation from the corresponding states of the scaled superheat-limit for classical fluids was apparent, thought to be caused by quantum effects on surface tension, and are appreciable for neon and hydrogen. (8 refs.)

101927 Vapour-phase studies of NaF-AlF_3 melts. I. The AlF_3-rich part. H.Kvande (Dept. of Chem., Univ. of Trondheim, Trondheim, Norway).
High Temp.-High Pressures (GB), vol.15, no.1, p.51-62 (1983).
Two experimental methods, the boiling point method and the transpiration method, have been used to determine total and partial vapour pressures and vapour compositions in the AlF_3-rich part of the system NaF-AlF_3. The measurements confirm the literature data by showing that the total pressure continues to increase with increasing AlF_3 content in the melt. The partial pressure of $NaAlF_4(g)$, which is the major vapour species in the system, has a maximum at the composition $NaAlF_4$. Thus, the results indicate the presence of the species $NaAl_2F_7(g)$ in the vapour phase at high AlF_3 contents. For the $NaAlF_4$ composition the data show that the vapour is richer in AlF_3 than is the melt, which then does not vaporize congruently. This is contrary to the literature data which suggest that the total vapour pressure is invariant at the $NaAlF_4$ composition. (23 refs.)

101928 Vapour-phase studies of NaF-AlF_3 melts. II. The NaF-rich part (cryolite). H.Kvande (Dept. of Chem., Univ. of Trondheim, Trondheim, Norway).
High Temp.-High Pressures (GB), vol.15, no.1, p.63-71 (1983).
For pt.I see ibid., vol.15, p.51-62 (1983). The total and partial vapour pressures and vapour compositions above molten cryolite (Na_3AlF_6) have been determined by use of the boiling point method and the transpiration method. The total pressures agree well with the literature data. The vapour is found to consist of ~90 mol.% $NaAlF_4(g)$; small amounts of $Na_2AlF_5(g)$ and NaF(g) are also present. Thus, the vapour contains more of the volatile component AlF_3 than does the melt. Revised versions of presure-composition diagram for the system NaF-AlF_3 are presented and discussed. (16 refs.)

101929 The evaporation coefficient of trans-diphenylethene at variable undersaturation: a new technique making use of special effusion cells. P.J.van Ekeren, M.H.G.Jacobs, J.C.A.Offringa, A.Schuijff, C.G.de Kruif (General Chem. Dept., State Univ. of Utrecht, Utrecht, Netherlands).
J. Chem. Phys. (USA), vol.79, no.4, p.2018-22 (15 Aug. 1983).
In the temperature range 325-40K the net evaporation coefficient $\alpha\gamma$ of trans-diphenylethene is measured. The authors describe a new technique that makes use of special effusion cells for variable undersaturation; the coefficient appears to be pressure independent, and is found to be $\alpha\gamma=1.03\pm0.03$. (14 refs.)

101930 Experimental results of homogeneous nucleation of supersaturated vapors. J.P.Garnier, P.Mirabel, H.Rabeony (Dept. de Chimie, Univ. Louis Pasteur, Strasbourg, France).
J. Chem. Phys. (USA), vol.79, no.4, p.2097 (15 Aug. 1983).
The authors have recently studied, in a diffusion cloud chamber, the homogeneous nucleation of several alcohol vapors, i.e. methanol, ethanol, n-propanol, and n-butanol over a large temperature range. In addition to the alcohols, they have also plotted recent results on acetone as well as older data obtained on 1,1,2,2-tetrachloroethane. These experimental results are compared with McGraw's theoretical predictions (ibid., vol.75, p.5514, 1981) for a simple fluid. The results confirm that alcohols, which are associated in the liquid phase, show critical supersaturation ratios less than those expected for a simple fluid. They confirm also that, when the degree of association of the alcohols decreases, i.e. when molecular weights increase, a tendency towards simple fluid behavior is observed. On the other hand, acetone shows good agreement with theory in reduced form while the results for 1,1,2,2-tetrachloroethane lie slightly above the theoretical curves, as it was already observed for other halogenated hydrocarbons studied in a diffusion cloud chamber. (4 refs.)

101931 Characteristics of the gas-liquid transition in a system of particles with finite lifetime. S.G.Tikhodeev (P.N. Lebedev Phys. Inst., Acad. of Sci., USSR).
JETP Lett. (USA), vol.37, no.5, p.255-8 (5 March 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.5, p.216-18 (5 March 1983).
The temperature range $0<T<T_1$, in which the gas-liquid transition in a system of particles with finite lifetime occurs without the hysteresis characteristic of first-order phase transitions, is estimated. (10 refs.)

101932 Vapour-liquid equilibrium of (methanol+a heptanone) at 298.15K. R.G.Rubio, J.A.R.Renuncio, M.Diaz Pena (Dept. de Quimica Fisica, Univ. Complutense, Madrid, Spain).
J. Chem. Thermodyn. (GB), vol.15, no.8, p.779-83 (Aug. 1983).
Vapour pressures for methanol+2-heptanone, +3-heptanone and +4-heptanone at 298.15K are reported. Liquid-phase values of G_m^E have been determined from vapour pressures. Analysis using the maximum-likelihood principle leads to the variances of the calculated parameters, and the selection, between two or more fits, of the one providing a better representation of the results. (16 refs.)

101933 Vapour-liquid equilibria by theory of solution of groups model. D.Hoshino, K.Nagahama, M.Hirata (Dept. of Industrial Chem., Tokyo Metropolitan Univ., Tokyo, Japan).
Mem. Fac. Technol. Tokyo Metrop. Univ. (Japan), no.32, p.3221-32 (1982).
The solution of group model is one of the useful and important methods for the prediction of liquid phase activity coefficients in terms of the parameters associated with the pairs of structural groups of solution. There are no group parameters found in the literature which predict vapour-liquid equilibria of water-2-ethoxyethanol system with reasonable accuracy. To obtain suitable group parameters, isothermal vapour-liquid equilibria of the above system at 54.9°C, 69.9°C and 84.9°C were measured. Isobaric vapour-liquid equilibria at 760 mmHg were predicted by utilising that group parameters and the results showed good agreement with those of the experimental data. (21 refs.)

101934 Liquid-gas coexistence equation. W.H.Tanttila (Phys. Dept., Univ. of Colorado, Boulder, CO, USA).
Phase Transitions (GB), vol.3, no.4, p.309-16 (1983).
General expressions for the densities of a liquid and a gas in equilibrium are expanded in terms of the reduced densities and temperatures. The resulting expansions are subjected to nondifferentiability and symmetry requirements, and the gas density expansion is fitted to the Clapeyron-Clausius equation at low gas densities to achieve zero-parameter coexistence equations for the liquid and the gas. (11 refs.)

101935 Vertical fin efficiency with film condensation. L.C.Burmeister (Mech. Engng. Dept., Univ. of Kansas, Lawrence, KS, USA).
Trans. ASME. J. Heat Transfer (USA), vol.104, no.2, p.391-3 (May 1982).
Film condensation of a saturated vapor on a vertical rectangular fin whose lower end is maintained at a fixed temperature was recently analyzed by Nader (1978). Numerical methods were used to accurately determine the fin temperature distribution and efficiency, accounting for variable condensate thickness along the fin length, in terms of two dimensionless parameters F_1 and F_2. Although it was remarked that correlation required only a single dimensionless parameter F_1/F_2^4, the basis for this was not set forth. In an earlier study of broader scope, Lienhard and Dhir (1974) gave this basis and numerically solved the same equations with slightly less accuracy but over a wider range of parameters. The results of these prior studies are presented in tabular and graphical forms. In the following, a more convenient closed-form approximate solution is developed for fin efficiency. (4 refs.)

101936 Solder creams and vapour phase technology. W.Rubin (Multicore Solders Ltd., Hemel Hempstead, England).
Midcon/82 Conference Record, Dallas, TX, USA, 30 Nov.-2 Dec. 1982 (El Segundo, CA, USA: Electron. Conventions 1982), p.16/4/1-4
The vapour phase concept by Western Electric has introduced a new branch of soldering technology in which solder creams will play an important part. The main advantages of soldering in the vapour phase relate to the close control of temperature and heat input to the solder and joints, and under these conditions solder creams operate most effectively. Previously, solder rings, gaskets and washers were applied to back planes and similar assemblies, but solder creams are more versatile in application with their ability to sit closely on the parts to be connected, partially acting as an adhesive before reflow and, most importantly, helping the solder and flux combination to enable soldering to take place very quickly. 64.70H Solid-vapour transitions

101937 Rate of evaporation of hydrocarbons from a hot surface: Nukiyama and Leidenfrost temperatures. A.A.Mills, J.D.Fry (Dept. of Phys., Univ. of Leicester, Leicester, England).
Eur. J. Phys. (GB), vol.3, no.3, p.152-4 (1982). [received: Aug. 1983]
The Nukiyama and Leidenfrost temperatures of the range of n-alkanes from pentane to hexadecane have been investigated, and their relationships to the standard boiling points determined. The Nukiyama temperatures prove to be only some 40°C above the latter, showing that maximum evaporation rates are produced by contact with surfaces not nearly so hot as might intuitively be expected. A temperature increase of only some 20-30°C beyond this point is sufficient to put the hydrocarbon into the slowly-evaporating Leidenfrost regime. (10 refs.)

101938 Evidence of a liquid-liquid-transition in *n*-tetracosane. The behavior of the specific volume. H.P.Grossmann, W.Dollhopf (Abteilung fur Angewandte Phys., Univ. Ulm, Ulm, Germany), J.K.Kruger.
Polym. Bull. (Germany), vol.9, no.12, p.593-7 (May 1983).
Dilatometric measurements of n-tetracosane from 330K up to 420K are reported. These experiments show evidence for a small kink in the specific volume-temperature curve. The correct statistical interpretation of the measured data yields a discrete transition temperature above the melting point at about 378K in close agreement with the results from other experimental methods. (22 refs.)

101939 The influence of a third constituent in binary solutions on critical properties studied by the nonlinear dielectric effect. J.Ziolo, Z.Ziejewska (Inst. Fizyki, Uniwersytet Slaski, Katowice, Poland), W.Pyzuk.
Phase Transitions (GB), vol.3, no.4, p.329-38 (1983).
Using the nonlinear dielectric effect studies have been made of the influence of a third constituent in a critical binary solution on the type of phase transition and on the value of the critical exponent defined by the relation $\Delta\epsilon/E^2 \sim 1/(T\text{-}T_c)^{\psi}$. Phase diagrams have been constructed indicating points of continuous phase transitions. (8 refs.)

101940 Mechanism of structural transformations in liquid metals. I.A.Novokhatskii, V.I.Arkharov, V.I.Lad'yanov (Polytech. Inst., Odessa, USSR).
Sov. Phys.-Dokl. (USA), vol.27, no.11, p.963-5 (Nov. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.1-3, p.367-70 (Nov. 1982).
Studies polytherms of the kinematic viscosities ν of specially purified liquid aluminum, tin, lead, bismuth, indium, and cadmium at temperatures 400-1100 degrees above their melting points. The viscosity measurements were carried out in the isothermal holding regime by the method of torsional oscillations of the melt-containing crucible. Under equilibrium conditions, the temperature dependence of the viscosity and the activation energy for viscous flow for all the melts studied change discontinuously several times, at definite temperatures, and this indicates that polymorphic structural arrangements are occurring. (13 refs.)

101941 Algebraic investigations in Landau model of structural phase transitions. II. Orbits, strata and epikernels. V.Kopsky (Inst. of Phys., Czechoslovak Acad. Sci., Praha, Czechoslovakia).
Czech. J. Phys. Sect. B (Czechoslovakia), vol.B33, no.7, p.720-44 (1983).
The author introduces the basic notions of the theory of permutation representations: stabilizers, orbits, stable subsets and strata. He considers the relation between permutation and linear representations which lead to some formulae connecting subduction coefficients, Clebsch-Gordan coefficients, and dimensions of stability spaces. This relation also leads to the concept of suborbits. Epikernels, the subgroups which are stabilizers of vectors of irreducible subspaces (either on the complex or on the real field)—are studied and several theorems about them are proved. Further he considers the relation between epikernels, stability spaces and strata for subspaces irreducible on the real field as compared with subspaces irreducible on the complex field. Finally, the exomorphism is defined with use of permutation representations. The vectors of irreducible subspaces and corresponding epikernels (their stabilizers) for real ireps (representations irreducible on the real) of the classical crystal point groups are given in the appendix. (12 refs.)

101942 Transformation processes in deformed Al-30 wt.% Zn alloy containing metastable precipitates. P.Bartuska, V.Synecek, M.Simerska (Inst. of Phys., Czechoslovak Acad. Sci., Praha, Czechoslovakia).
Czech. J. Phys. Sect. B (Czechoslovakia), vol.B33, no.7, p.831-6 (1983).
The Al-30 wt.% Zn alloy containing metastable α_R' or α' precipitates was cold rolled to investigate the effect of plastic deformation on transformation processes during the subsequent ageing at 200°C. Transmission electron microscopy and X-ray diffraction studies proved that the deformation leads to the rapid decomposition of deformed α_R' and α' precipitates and enhances also the decomposition of α' precipitates formed from α_R' to α' transformation. The deformation does not, however, change the growth rate of α' particles. It leads, therefore, to the decrease of critical sizes of α' particles for the α' to β transformation. The increasing degree of deformation enhances the density of nucleation sites for the β formation on α/α' interfaces and leads to the decrease in sizes of stable β precipitates. The acceleration of transformation processes is associated with the partial relaxation of stresses introduced by the applied deformation. (5 refs.)

101943 New type of soliton solutions from a Landau potential describing the β-γ-δ-transitions in $(C_3H_7NH_3)_2MnCl_4$. P.Muralt, R.Kind (Lab. of Solid State Phys., Swiss Federal Inst. of Technol., Zurich, Switzerland).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.689-94 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
The incommensurate γ-phase of the perovskite-type layer structure compound $(C_3H_7NH_3)_2MnCl_4$ is sandwiched between two phases (β,δ) which have the same structure. The Landau potential describing this behaviour reveals besides the plane-wave solution, new types of soliton solution which differ from the solutions of the sine-Gordon equation. (6 refs.)

101944 Critical dynamics of zero-temperature structural phase transitions. Y.T.Millev, D.I.Uzunov (Nadjakov Inst. of Solid State Phys., Bulgarian Acad. of Sci., Sofia, Bulgaria).
J. Phys. C (GB), vol.16, no.21, p.4107-12 (30 July 1983).
The critical dynamics of a class of displacive second-order phase transitions is studied in the limit $T_c \to 0$ (T_c being the critical temperature). Both the renormalisation-group recursion relations method and direct calculation are used for the derivation of the critical exponents up to order ε^2 ($\varepsilon = 3-d$). The static exponents remain, in some sense, universal, whereas the dynamic exponent has no ε corrections. (19 refs.)

101945 The incommensurate-commensurate transition in a random-field model. T.Nattermann (Sektion Phys., Humboldt-Univ. Berlin, Berlin, Germany).
J. Phys. C (GB), vol.16, no.21, p.4113-24 (30 July 1983).
The effect of random-field-induced domain wall wandering on the nature of the uniaxial incommensurate-commensurate (IC) transition is studied in the framework of a *d*-dimensional 'random-rod' model. In this model, the random field $h(\mathbf{r})$ couples linearly to the wall elongations. Both short- and long-range field correlations $\langle h(\mathbf{r})h(0)\rangle \sim |\mathbf{r}|^{-D+1}$ are considered. It is found that the domain wall density l^{-1} vanishes with the driving parameter δ (e.g. temperature, pressure) as $(\delta-\delta_c)^{\beta}$ with $\beta=(5-D)/2(D-3)$ for $3<D<5$. For $D>d$, D has to be replaced by d. If $D(d)$ is linear in d then $\beta\text{-}(d_R-d)/2(d-d_c^-)$ (*) for $d_c^- \leq d < d_R$—where d_R and d_c^- denote the upper critical dimensionality for the roughening transition and the lower critical dimensionality for the occurrence of a conventionally ordered phase, respectively—$D(d_R)=5$, $D(d_c^-)=3$. For $D\geq 5$ or $d\geq d_R$ the classical result $l^{-1}\sim \ln^{-1}(\delta-\delta_c)^{-1}$ applies; for $D\leq 3$ or $d\leq d_c^-$ there is no IC transition. The results for a corresponding bulk random-field model follow from the 'random-rod' model by means of the Villain relation $D(d)=(5+2d)/3$ for all d, i.e. from (*) with $d_R=5$, $d_c^-=2$. It is argued that the formula (*) applies for a variety of IC transitions with d_R and d_c^- specifying different universality classes. (33 refs.)

101946 Interface phenomenology, dipolar interaction, and the dimensionality dependence of the incommensurate-commensurate transition. T.Natterman (Sektion Phys., Humboldt-Univ. Berlin, Berlin, Germany).
J. Phys. C (GB), vol.16, no.21, p.4125-35 (30 July 1983).
Previous results on fluctuation-induced domain wall wandering in continuous systems and its influence on the nature of the uniaxial incommensurate-commensurate transition are unified in a phenomenological interface theory. A relation between the exponents β and ψ describing the vanishing of the domain wall density with the driving parameter δ, and the divergence of the effective wall width for vanishing pinning potential, respectively, is established. If ψ is linear in the dimensionality, d, we get for $d_R\geq d\geq d_c$, $\beta=(d_R-d)/2(d\text{-}d_c)$. The critical dimensionalities d_R and d_c depend on the model under consideration. The changeover from the weak to the strong fluctuation regime is characterised by the different behaviour of the wall correlation length $\xi_{\perp}$. If walls separate domains of opposite polarisation, dipolar interaction increases the stiffness of the walls and decreases d_R and d_c. Their values for thermal, quantum and random field fluctuations are calculated. In the dipolar case, frozen impurities lead to a lower critical dimensionality $d_c=2$ and $\beta={}^1/_2$ for $d=3$, in agreement with experiments. (32 refs.)

101947 Neutron scattering study on the structural transition of quasi-one-dimensional conductor $K_{0.3}MoO_3$. M.Sato, H.Fujishita, S.Hosnino (Inst. for Solid State Phys., Univ. of Tokyo, Tokyo, Japan).
J. Phys. C (GB), vol.16, no.24, p.L877-82 (30 Aug. 1983).
Preliminary results of the neutron diffraction and inelastic scattering studies on the quasi-one-dimensional conductor $K_{0.3}MoO_3$ with a metal-insulator transition are reported. The temperature dependence of the intensity of the superlattice reflection is found to be approximately described by a simple equation. A phonon mode seems to have an almost complete softening at the transition temperature T_c. The existence of the large central peak in the inelastic spectra above T_c suggest that the local correlation between electrons is very strong. The wavevector of the charge density wave smoothly approaches the commensurate one, as the temperature is lowered and lock-in transition does not occur down to $T\simeq 6$K. (12 refs.)

101948 Incommensurate crystal phases in mean-field approximation. T.Janssen (Inst. for Theoretical Phys., Univ. of Nijmegen, Nijmegen, Netherlands), J.A.Tjon.
J. Phys. C (GB), vol.16, no.24, p.4789-810 (30 Aug. 1983).
A model for structural phase transitions in crystals in three dimensions is studied in a mean-field approximation. The forces between the particles are short-range (up to second neighbours) and non-linear. Contrary to formerly studied models the temperature dependence is explicitly taken into account in this way. The phase diagram shows incommensurate phases as well as superstructures. The form and properties of the states in this phase are discussed. It is found that in the incommensurate phase two regions can be distinguished, characterised by the form of the modulation. In one the modulation is smooth and nearly sinusoidal; in the other there are discommensurations and chaotic states. The dynamic properties are studied with an effective Hamiltonian which extends the mean-field approach. It is shown that the vibrations in the two incommensurate regions are qualitatively different: in

one region there is a zero-frequency phason, whereas in the discommensuration regime the phason is pinned and localised states occur. (20 refs.)

101949 The intralayer order-disorder transition in monoclinic $Cr_{3\pm x}Se_4$. T.Ohtani, R.Fujimoto, H.Yoshinaga, M.Nakahira (Lab. for Solid State Chem., Okayama Univ. of Sci., Okayama, Japan), Y.Ueda.
J. Solid State Chem. (USA), vol.48, no.2, p.161-7 (1 July 1983).
The $Cr_{3\pm x}Se_4$ shows an order-disorder transition from the monoclinic Cr_3Se_4 type to the CdI_2-type structure. This transition originates in the intralayer disordering of metal vacancies in the alternate partially filled metal layers along the *c* axis. The transition is reversible and of first order. The transition temperature vs. composition curve has a maximum (~900°C) at a stoichiometric composition of Cr_3Se_4. A statistical treatment of this phenomenon was attempted via the Bragg-Williams approximation. (11 refs.)

101950 Transition electron microscopic study of reduced Ca_2UO_5. V.Krasevec, A.Prodan, J.Holc, D.Kolar (J. Stefan Inst., E. Kardelj Univ., Ljubljana, Yugoslavia).
J. Solid State Chem. (USA), vol.48, no.2, p.300-5 (1 July 1983).
Structural changes of Ca_2UO_5 during reduction in hydrogen were studied by transmission electron microscopy. It was shown that monoclinic Ca_2UO_5 changes into triclinic $Ca_4U_2O_9$. They are related, respectively, to the fluorite and the C-M_2O_3 structures, so that the product is a superstructure of the latter. Reduction occurs along the $(100)_t$ planes originating from the $(006)_m$ planes of the parent structure by diminishing the coordination number of the Ca cation from 7 to 6. (8 refs.)

101951 Structural phase transitions and polaritons in low-frequency region. S.Kojima (Inst. of Appl. Phys., Univ. of Tsukuba, Ibaraki, Japan).
J. Spectrosc. Soc. Jpn. (Japan), vol.32, no.2, p.96-102 (1983). In Japanese.
Dispersion relations of low-frequency photon polaritons in the crystals, which undergo structural phase transitions, give important information about the mechanisms of the transitions. In this work, low-frequency polaritons have been measured by a combination of the double monochromator with concave holographic gratings and the optical system designed for this purpose. The results of measurements are given for the crystals BNN, $Sr_2Nb_2O_7$ and GMO. (21 refs.)

101952 Transition temperature—spontaneous strain—atomic displacement relationships in ferroelastics. W.I.F.David (Inorganic Chem. Lab., Oxford Univ., Oxford, England).
Mater. Res. Bull. (USA), vol.18, no.7, p.809-16 (July 1983).
The Abrahams-Kurtz-Jamieson relationship, derived for ferroelectrics, has been extended to ferroelastic materials. It is shown that such relationships often shed light on the structural mechanisms that cause ferroic distortions. The ferroelastic properties of the isostructural compounds $NdNbO_4$ and $NdTaO_4$ are considered, and it is shown that the ferroelastic transition temperatures and saturated spontaneous strain components are, respectively, proportional to the square of and linearly proportional to the saturated spontaneous displacements of the Nb^{5+} and Ta^{5+} ions. (16 refs.)

101953 Order-disorder transition in the deficient spinel $Ga_{1.33}Cr_4S_8$. H.Ben Yaich, J.-C.Jegaden, M.Potel, M.Sergent (Lab. de Chimie Minerale B, Univ. de Rennes-Beaulieu, Rennes, France), P.Huguet, G.Alquier.
Mater. Res. Bull. (USA), vol.18, no.7, p.953-60 (July 1983). In French.
The spinel compound $Ga_{1.33}Cr_4S_8$ may be prepared in two different varieties. The low-temperature α-form exhibits a well-defined gallium occupancy on the tetrahedral sites, while the high-temperature β-phase is a disordered form. Single-crystal structural studies show a continuous order-disorder transition between these two limits, as a function of the synthesis temperature. Magnetic studies have been done by statical and dynamical methods. (5 refs.)

101954 Order-disorder transition and magnetic transformation of $Fe_{0.8}Al_{0.2}$ alloy. J.A.A.Khan, M.A.Shaikh, N.Ahmad, N.M.Butt (Pakistan Inst. of Nuclear Sci. & Technol., Nilore, Pakistan).
Nucleus (Pakistan), vol.18, no.4, p.15-19 (Oct.-Dec. 1981).
The electrical resistance of 20 at.% Al in Fe has been measured on polycrystalline samples over a temperature range 30-700°C. The study revealed the existence of a mixture of ordered and disordered phases from 400-500°C; and an order-disorder transition at $T_0=500\pm3$°C which is in good agreement with the results obtained on the same specimen using neutron diffraction technique. The results also showed a magnetic transformation at $T_c=625\pm3$°C. (21 refs.)

101955 Evidence for a commensurate-incommensurate phase transition with an intermediate fluid phase: N_2 adsorbed on Ni(110). M.Grunze, P.H.Kleban, W.N.Unertl (Fritz-Haber-Inst., Max-Planck-Gesellschaft, Berlin, Germany), F.S.Rys.
Phys. Rev. Lett. (USA), vol.51, no.7, p.582-5 (15 Aug. 1983).
Low-energy electron diffraction and thermodynamic measurements are reported for molecular nitrogen weakly chemisorbed on a Ni(110) surface in the temperature region between 87 and 150K. A commensurate (2×1) phase transforms with increasing coverage into a sequence of smoothly varying incommensurate solid structures via a liquidlike intermediate phase. This is apparently the first experimental example of the commensurate-fluid-incommensurate phase sequence in uniaxial systems predicted by several recent theories. (11 refs.)

101956 A structural description for the FCC→BCC martensitic transformation in terms of $\{011\}\ \langle01\bar{1}\rangle_{fcc}$ simultaneous double shear. Relation with the atomic configuration in $\{3,15,10\}_{fcc}$ habit plane.. A.Le Lann, A.Dubertret (Centre d'Etudes de Chimie Metall., CNRS, Vitry-sur-Seine, France).
Phys. Status Solidi a (Germany), vol.78, no.1, p.309-21 (16 July 1983).
The model proposed allows a correlation to be established between the main experimental results and the movement of atoms during the transformation. This movement is defined with respect to the $\langle01\bar{1}\rangle_{fcc}\rightarrow\langle\bar{1}11\rangle_{bcc}$ close-packed rows which are 'strain invariant rows' of the transformation. The homogeneous and heterogeneous part of the deformation result from the same kind of atom movement which can be described by $\{011\}\langle01\bar{1}\rangle_{fcc}$ transverse waves. A simple atomic configuration is proposed for the $\{\bar{2}25\}_{fcc}$ and $\{3,15,10\}_{fcc}$ habit plane. The habit plane structure is correlated with the Kurdjumov-Sachs or Nishiyama orientation relations and to the symmetry conditions during the transformation. (46 refs.)

101957 Calculation of high-pressure phase transitions in solid N_2 and the pressure dependence of intramolecular mode frequencies. V.Chandrasekharan (Lab. des Interactions Moleculaires et Hautes Pressions, Univ. Paris-Nord, Villetaneuse, France), R.D.Etters, K.Kobashi.
Phys. Rev. B (USA), vol.28, no.2, p.1095-8 (15 July 1983).
A calculation that minimizes the energy of solid N_2 with respect to a rhombohedral distortion of the *Pm*3*n* structure shows that the low-temperature phase transition occurs into the *R*3*c* calcite structure at $P\approx19.2$ kbar with a volume change of 0.125 cm^3/mole. This transition agrees with recent Raman scattering measurements. Another transition from *R*3*c* into *R*3*m* is predicted at $P\simeq67.5$ kbar, with a volume change of 0.1 cm^3/mole. The pressure dependence of the intramolecular mode frequencies for the *R*3*c* structure are in reasonably good agreement with the two main branches observed experimentally. (12 refs.)

101958 High-pressure phase transitions in potassium and phase relations among heavy alkali metals. K.Takemura, K.Syassen (Phys. Inst. III, Univ. Dusseldorf, Dusseldorf, Germany).
Phys. Rev. B (USA), vol.28, no.2, p.1193-6 (15 July 1983).
The optical reflectivity (0.5 eV$\leq\hbar\omega\leq$5 eV) of potassium metal has been measured to 380 kbar at room temperature. Two phase transitions occur at 114 and 188 kbar, respectively. By comparison to the high-pressure optical properties of Cs and Rb the phase K-II has FCC structure. At 188 kbar, K undergoes a considerable change in its optical response indicating the occurrence of a complicated Fermi-surface topology. The phase transitions in K, together with recent experimental investigations of Rb and Cs, reveal systematic trends in the phase stability of heavy alkali metals under pressure. (22 refs.)

101959 Phase relations and properties of lithium via molecular dynamics. R.G.Munro (Inorganic Materials Div., Center for Materials Sci., NBS, Washington, DC, USA), R.D.Mountain.
Phys. Rev. B (USA), vol.28, no.4, p.2261-3 (15 Aug. 1983).
The phase diagram of lithium in the region $295\leq T\leq600$K and $0\leq p\leq12$ GPa has been studied theoretically with the use of the recently developed molecular dynamics formalism of Parrinello and Rahman (1980). Excellent agreement between theory and experiment has been obtained for (1) the room-temperature BCC-FCC structural phase transition; (2) the temperature dependence of the BCC-FCC phase boundary; (3) the room-temperature compression curves for the BCC and FCC phases; and (4) the BCC-liquid melting curve. Additionally, a theoretical prediction has been made for the isobaric thermal expansion from 400 to 600K at GPa pressure. (11 refs.)

101960 Phase transitions in 3,5-dichloropyridine. F.Romain, P.Tougard, B.Pasquier, N.Le Calve, A.Novak (Lab. de Spectrochimie Infrarouge et Raman, Thiais, France), A.Peneau, L.Guibe, J.Ramakrishna.
Phase Transitions (GB), vol.3, no.4, p.259-74 (1983).
Structural phase transitions in 3,5-dichloropyridine crystal have been studied by calorimetry (150-300K), X-ray diffraction (300K), ^{35}Cl and ^{14}N nuclear quadrupole resonance (75-300K) and vibrational spectroscopy (20-300K). Three phases have been shown to exist: phase I, between 338 and 287.5K, phase II, between 287.5 and 167.5K, and phase III, below 167.5K. Phase I is characterised by the space group $P2_1/m$ and $Z=2$ whereas phases II and III remain centrosymmetric but double the unit cell. All the phases are ordered and contain crystallographically equivalent molecules. The I⇄II transition is of first order and probably of the reconstructive type while the II⇄III transition is believed to be displacive. Both transitions are monitored by predominantly R'_x and R'_z librational motions. (12 refs.)

101961 Time-dependent strains near the 105K transition in $SrTiO_3$. A.Okazaki, N.Ohama (Dept. of Phys., Kyushu Univ., Fukuoka, Japan), B.T.M.Willis, Y.Iwata, H.J.Scheel, K.A.Mueller.
Phase Transitions (GB), vol.3, no.4, p.339-45 (1983).
Reports the temperature dependence of the neutron diffraction intensities of flux-grown nearly dislocation-free $SrTiO_3$ crystals, upon cooling and heating through the structural phase transition at 105K, for both the fundamental and the superlattice reflections. The results suggest that the transition is strongly controlled by macroscopic strains when the crystal is kept in the tetragonal phase and then warmed up, i.e. a time-dependent memory effect is observed. (13 refs.)

101962 The fast-ion transition in FCC silver iodide. J.L.Tallon, R.G.Buckley (Phys. & Engng. Lab., DSIR, Lower Hutt, New Zealand).
Solid State Commun. (USA), vol.47, no.7, p.563-6 (Aug. 1983).
An analysis of previously reported data on electrical conductivity, adiabatic temperature change with pressure, and sound velocity confirms that the FCC phase of AgI has a fast-ion type II transition. This results in a steepening of the FCC/α-phase boundary which probably cusps in to a triple point at the α-phase order/disorder transition. Thermal expansion, compressibility and heat capacity are calculated for the FCC phase. (13 refs.)

101963 Phase transitions and order parameters. R.M.White (Xerox Palo Alto Res. Centers, Palo Alto, CA, USA).
Alloy Phase Diagrams. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.327-35
The usefulness of the concept of an order parameter in describing phase transitions is discussed. Examples of order parameters are given in the context of broken symmetries and defects in the order parameters are classified in terms of these symmetries. (17 refs.)

64.70M Transitions in liquid crystals

101964 About the phase transition in the smectic A phase of a liquid crystal. D.F.Aliev, Ch.G.A.Khundov, A.Kh.Zeinally, T.Z.Kulieva.
Izv. Akad. Nauk Az. SSR Ser. Fiz.-Tekh. & Mat. Nauk (USSR), no.6, p.91-3 (1982). In Russian.
The phase transition smectic $A \rightarrow$ isotropic liquid was investigated. The phenomenon of electrohydrodynamic instability has been detected and studied. (6 refs.)

101965 Phase transitions in polypeptide liquid crystals: a reentrant isotropic phase. R.Subramanian, R.J.Wittebort, D.B.DuPre (Dept. of Chem., Univ. of Louisville, Louisville, KY, USA).
Mol. Cryst. & Liq. Cryst. (GB), vol.97, no.1-4, p.325-36 (1983). (Proceedings of the Ninth International Liquid Crystal Conference, Bangalore, India, 6-10 Dec. 1982).
Optical and C-13 NMR examinations of concentrated solutions of poly-γ-benzyl-L-glutamate (PBLG) in a mixed solvent system containing a denaturant acid, show that this polymer liquid crystal has both a low and high temperature isotropic phase. The latter is due to thermal disruption of long range orientational order of the elongated macromolecules. The former reentrant isotropic phase is a result of an intramolecular helix to random coil transition, which leads to a macromolecular conformation inconsistent with liquid crystallinity. (15 refs.)

101966 The metabolemeter. II. Detection of mesogenic polymorphism under pressure using small quantities. J.M.Buisine, B.Soulestin (Lab. de Dynamique des Cristaux Moleculaires, Univ. des Sci. et Tech. de Lille, Villeneuve d'Ascq, France), J.Billard.
Mol. Cryst. & Liq. Cryst. (GB), vol.97, no.1-4, p.397-406 (1983). (Proceedings of the Ninth International Liquid Crystal Conference, Bangalore, India, 6-10 Dec. 1982).
Every first order phase transition for mesogens can be detected by the continuous recording, as a function of temperature, of the pressure of the sample enclosed in a metallic cell. Studies of a compound (octylcyanobiphenyl) exhibiting several transformations (crystal-smectic A, smectic A-nematic, nematic-liquid) show that this barometric method is convenient to detect polymorphism from one thermobarogram, and to draw the Clapeyron phase diagram; the smectic A-nematic transition involving small enthalpy and volume changes is clearly observable and this method is very sensitive. Moreover, the enthalpies and volumes of transition can be deduced from the pressure changes. Lastly, pressure and temperature are intensive data, and very little sample (1.3 mm^3) may be used. (18 refs.)

101967 Scaled particle theory of a system of spherocylinders: extension of calculations to high pressures. K.L.Savithramma, N.V.Madhusudana (Raman Res. Inst., Bangalore, India).
Mol. Cryst. & Liq. Cryst. (GB), vol.97, no.1-4, p.407-15 (1983). (Proceedings of the Ninth International Liquid Crystal Conference, Bangalore, India, 6-10 Dec. 1982).
The authors have refined the scaled particle theory calculations on a system of spherocylinders by improving the evaluation of the angle dependent term in the expansion for the excluded volume. They present calculations on the nematic-isotropic transition properties for a hard rod system as well as a system superposed with an attractive potential of the Maier-Saupe type and subjected to different external pressures. The results are compared with the experimental data on para-azoxyanisole. (16 refs.)

101968 Nematic-isotropic transition in some lattice models for rigid cores having semiflexible tails: segmental Lennard-Jones interactions. F.Dowell (Chem. Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
Phys. Rev. A (USA), vol.28, no.2, p.1003-15 (Aug. 1983).
Two average-environment simple cubic lattice models—a refined model and a simple model, both having site-site (segmental)-pair Lennard-Jones (LJ) interactions—for molecules composed of rigid cores having semiflexible tails are presented. The calculated values of the following properties at the nematic-isotropic transition for rigid rods of varying length are compared with relevant experimental data for PAA (*p*-azoxyanisole, or 4,4′-dimethoxyazoxybenzene): temperature, core orientational order parameter, nematic density and volume, relative density change, and relative entropy change. The temperature change as a function of volume change at constant order parameter is also discussed. In general, both LJ models give considerably better quantitative agreement with experiment, especially for the temperature and the relative density change, than do the earlier lattice models with hard repulsions, with or without constant segmental pair interaction energies. In most aspects, these LJ models give good quantitative agreement with experiment. These LJ models elucidate the importance of realistic intermolecular potentials, especially the role of soft repulsions, in describing an order-disorder transition between two condensed phases. (37 refs.)

101969 Landau theory of cholesteric blue phases. H.Grebel, R.M.Hornreich, S.Shtrikman (Dept. of Electronics, Weizmann Inst. of Sci., Rehovot, Israel).
Phys. Rev. A (USA), vol.28, no.2, p.1114-38 (Aug. 1983).
A detailed presentation of the Landau theory of the cholesteric blue phase (BP) is given with emphasis on the comparison of model predictions with reported experimental data. The basic model, which is asymptotically exact in the high-chirality limit, leads to the prediction of a body-centered cubic (bcc) O^5 ($I432$) structure for the BP. However, the model can be systematically extended to physical chiralities and used to calculate the free energies of more complex cubic structures. In particular, BCC O^8 ($I4_132$) and simple-cubic O^2 ($P4_232$) structures are analyzed and their optical and thermodynamic properties, as well as those of O^5, are compared with those reported for the two observed phases, BPI and BPII. It is shown that, in general, the known properties of these phases are consistent with a structure assignment of O^8 for BPI and O^2 for BPII. Some promising lines for future investigation are indicated. (28 refs.)

101970 Phase studies of a liquid crystalline polymer: hydroxypropyl cellulose. M.J.Seurin, A.ten Bosch, P.Sixou (Lab. de Phys. de la Matiere Condensee, CNRS, Nice, France).
Polym. Bull. (Germany), vol.9, no.8-9, p.450-6 (March 1983).
Phase diagrams for the isotropic-anisotropic phase transition in solutions of a thermotropic cellulose derivative, hydroxypropyl cellulose are presented. The effect of the molecular weight is demonstrated. A comparison to the theory of semi-rigid liquid crystalline polymers is given. (17 refs.)

101971 Density studies in *N*(*p*-*n*-heptyloxy benzylidene)*p*-*n*-butyl aniline across S_G-S_C, S_C-S_A, S_A-N and N-I phases. N.V.S.Rao, V.G.K.M.Pisipati (Faculty of Phys. Sci., Nagarjuna Univ., Nagarjuna Nagar, India).
Phase Transitions (GB), vol.3, no.4, p.317-28 (1983).
The density ρ of *N*(*p*-*n*-heptyloxy benzylidene) *p*-*n*-butyl aniline (HYBBA) is measured as a function of temperature from the isotropic liquid to the smectic-G phase. The compound is tetramorphic exhibiting three smectic phases S_G, S_C, S_A and a nematic phase. The density changes across the phase transformations and the calculated thermal expansion coefficient confirm the order of the S_G-S_C, S_A-N and N-I transitions as first-order, with S_C-S_A transition as weakly first or second-order. The first-order S_A-N phase transformation in this compound, which is weakly polar, is in agreement with McMillan's theoretical predictions (1971), and is different from other polar compounds. 64.70P Glass transitions

101972 Comparative study of diluent effects on the glass transition of polyvinylchloride and phenolphthalein. M.Pizzoli, M.Scandola, G.Ceccorulli, G.Pezzin (Istituto Chimico 'G. Ciamician', Bologna Univ., Bologna, Italy).
Polym. Bull. (Germany), vol.9, no.8-9, p.429-36 (March 1983).
Some binary polymer-diluent systems showed an 'unusual T_g-concentration dependence'. In order to investigate the relevance of the polymeric nature of the high-T_g component in determining this 'anomaly', two series of mixtures having the same diluent (di-n-Butylphthalate or Tricresylphosphate) and, as the high-T_g component, either a polymer (PVC) or a low-molecular weight substance (Phenolphthalein), have been examined. A discontinuity is found, as expected. In the 'polymeric' systems PVC-di-n-Butylphthalate and PVC-Tricresylphosphate, as well as in phenolphthalein-di-n-butylphthalate mixtures where, however, the deviations from the calculated T_g-composition curve are much less marked. It is concluded that the presence of a polymer is not a necessary requirement for the occurrence of the above mentioned 'anomaly'. (11 refs.)

101973 The effect of sequence distribution on glass transition of donor-acceptor copolymer systems. H.A.Schneider, H.N.Neto (Inst. fur Makromolekulare Chem., Univ. Freiburg, Freiburg, Germany).
Polym. Bull. (Germany), vol.9, no.8-9, p.457-63 (March 1983).
T_g studies on copolymers of methyl methacrylate and of butyl methacrylate with N-(2-hydroxyethyl) carbazolyl methacrylate as electro-donor and respective with methacryloyl-β-hydroxy-ethyl-3,5-dinitrobenzoate as electro-acceptor comonomer have shown that the glass transition behaviour can only be explained by the effect of triad sequences. Introduction of the electro-donor (or electro-acceptor) group into a methacrylate triad always increases the T_g contribution of the homopolymer triad, whilst the introduction of a methacrylate group into the electro-donor (acceptor) triad decreases the respective T_g contribution. (6 refs.)

101974 Characteristics of polynorbornene and ethylene-propylene terpolymer blends. C.S.Wang (Polymers Dept., General Motors Res. Labs., Warren, MI, USA).
Polym. Eng. & Sci. (USA), vol.23, no.9, p.530-3 (June 1983).
In this study characteristics of polynorbornene (PNR) and ethylene-propylene terpolymer (EPDM) blends were examined in terms of compatibility, cocuring, and ozone resistance. For most of the blend compositions, two glass transition temperatures (T_g) at about −30 and −50°C were observed from differential scanning calorimetry data for both uncured and cured samples. The transitions correspond to the T_gs of the component polymers, suggesting that the blends are microheterogeneous. The two-phase blends are difficult to cocure as evidenced by the fact that tensile strengths of the blends, when plotted as a function of blend composition, deviate from the linear or additive behavior. Improved cocuring of the blends, however, can be achieved by matching the cure rates of the components. The ozone resistance of the blends containing 25 percent or more EPDM was substantially improved as compared with that of PNR. Therefore, the newly developed PNR can be used for applications requiring ozone resistance by properly blending it with EPDM. (8 refs.)

64.75 SOLUBILITY, SEGREGATION, AND MIXING

101975 Thermodynamic analysis of miscibility gap due to ordering in ternary systems. T.Nishizawa, S.M.Hao, M.Hasebe, K.Ishida (Dept. of Materials Sci., Tohoku Univ., Sendai, Japan).
Acta Metall. (USA), vol.31, no.9, p.1403-16 (Sept. 1983).
Effect of ordering on the formation of miscibility gap in ternary systems has been investigated. A simple and explicit treatment for expressing the Gibbs energy change due to ordering has been developed on the basis of the Gorsky-Bragg-Williams approximation. An advantage of the present model is to permit the authors to calculate easily the miscibility gap in the whole range of ternary system. It has been found that the ordering plays a key role on the miscibility gap and the summit point is raised to a much higher temperature than expected by the regular solution model. The miscibility gap is not simple helmetlike, but has a peculiar ridge along the order-disorder transition line. The overlapping of magnetic transition and ordering causes complexity in the miscibility gap. (29 refs.)

101976 Statistical modelling of isomorphous precipitation. Yu.I.Paskal', V.E.Domrachev (V.D. Kuznetsov Siberian Physicotech. Sci.-Res. Inst., State Univ., Tomsk, USSR).
Fiz. Met. & Metalloved. (USSR), vol.55, no.6, p.1051-7 (June 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
Statistical modelling of isomorphous precipitation of a binary solid solution is carried out in a wide range of temperatures in order to determine qualitative changes in the nature of the kinetics of this process as a result of cooling. The Monte Carlo method is applied to a two-dimensional triangular rigid Ising lattice of 60×60 site dimensions with periodic boundary conditions. An allowance is made for the interatomic interaction only in the immediate vicinity of a given site. The calculations are carried out for the concentration of the second component $c_0=0.067$ (240 atoms out of 3600) and the results indicate that in a certain range of temperatures there is a qualitative change in the precipitation kinetics and at temperatures below this range the process has the characteristics of spinodal precipitation. (21 refs.) *A.T.*

101977 Anomaly of the solubility of hydrogen in ferromagnetic metals near the Curie point. V.I.Shapovalov, L.V.Boiko (Metallurgical Inst., Dnepropetrovsk, USSR).
Fiz. Met. & Metalloved. (USSR), vol.55, no.6, p.1220-1 (June 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
A study was made of the solubility of hydrogen in iron, cobalt, and nickel near their Curie temperatures. The solubility was determined by the method of equilibrium saturation and quenching, followed by vacuum outgassing during heating. The results were not reproducible because of the formation of cracks quenched from temperatures in the paramagnetic state. An anomalous increase in the solubility of hydrogen above the Curie point was attributed to the absence of domain walls. (7 refs.) *A.T.*

101978 Small aggregates. J.Friedel (Lab. de Phys. des Solides, Univ. Paris-Sud, Orsay, France).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.507-20 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
Small aggregates, from a few to about 1000 atoms constitute a specific domain, which differs both from the simple atomic or molecular gases and from macroscopic condensed matter. The author concludes that all nucleation processes must be very carefully studied, on an atomic and electronic scale, and that each specific case must be analyzed for itself. This refers to first order transitions, either condensation from vapours or liquids—the case of ice is of interest to meteorologists and astrophysicists—or in condensed matter, where the early example of GP zones shows the importance of the elastic stresses developed. It also refers to kinetics of reactions, especially radiolysis or recovery of radiation damage in solids. (no refs.)

101979 Thermodynamic models of alkali-metal vapor transport in silicate systems. J.W.Hastie, W.S.Horton, E.R.Plante, D.W.Bonnell (Chem. Stability & Corrosion Div., US NBS, Washington, DC, USA).
High Temp.-High Pressures (GB), vol.14, no.6, p.669-79 (1982). [received: June 1983] (International Conference on Chemistry of Materials at High Temperatures, Harwell, Oxon., England, 7-10 Sept. 1981).
A thermodynamic data base for liquid and solid mixtures containing K_2O, Al_2O_3, and SiO_2 has been developed and is described. This data base together with the hypothesis of ideal mixing of complex phases (IMCP) reproduces experimental activity data over a wide range of composition and temperature. (21 refs.)

101980 Surface spinodals and extended wetting in fluids and polymer solutions. H.Nakanishi (Inst. for Theoretical Phys., Univ. of California, Santa Barbara, CA, USA), P.Pincus.
J. Chem. Phys. (USA), vol.79, no.2, p.997-1003 (15 July 1983).
A novel concept of 'surface' spinodal decomposition is introduced in the context of wetting and prewetting first order transitions for simple fluids in contact with a bounding wall. Qualitative and semiquantitative discussions are made within the framework of a phenomenological Landau theoretical model for semi-infinite systems with a (short-ranged) wall potential. A concept of 'extended wetting' is also proposed, whereby even for $T<T_w$ (the wetting temperature) a macroscopically thick 'wetting' layer can form near the wall upon rapidly quenching the solution into the coexistence region. These ideas are carried over to polymer solutions and blends near their consolute points where the characteristic time scales should be more manageable. (22 refs.)

101981 The simulation of spinodal decomposition in two dimensions: a comparison of Monte Carlo and Langevin dynamics. P.Meakin (Inst. for Theoretical Phys., Univ. of California, Santa Barbara, CA, USA), H.Metiu, R.G.Petschek, D.J.Scalapino.
J. Chem. Phys. (USA), vol.79, no.4, p.1948-54 (15 Aug. 1983).
Langevin dynamics and Monte Carlo methods have recently been developed for the simulation of spinodal decomposition. In the paper the authors show, using the central limit theorem, that the Monte Carlo method (in the limit of small step sizes) is equivalent to Langevin dynamics (in the high friction limit). In this limit an exact relationship is established between the number of trials in a Monte Carlo simulation and Langevin dynamics time. The relationship between the Monte Carlo and Langevin dynamics methods is demonstrated for practical simulations and the effects of deviations from the small step size limit in the Monte Carlo simulation is a linear distortion of the effective time scale, provided the step size is not too large. The equivalence of the Monte Carlo and Langevin dynamics methods (in the appropriate limits) are demonstrated for the case of spinodal decomposition in two dimensions. However, their theoretical analysis is quite general and is not restricted to spinodal decomposition or two-dimensional systems. (11 refs.)

101982 Some observations on oxygen precipitation/gettering in device processed Czochralski silicon. H.R.Huff, H.F.Schaake, J.T.Robinson, S.C.Baber, D.Wong (Texas Instruments Inc., Dallas, TX, USA).
J. Electrochem. Soc. (USA), vol.130, no.7, p.1551-5 (July 1983).
Several results of the authors' experimental program studying the relationship between the properties of the silicon starting material and N-channel MOS dynamic RAM circuit performance is described. The thermal history and oxygen and carbon concentrations control the silicon material properties and much of the subsequent circuit performance. The beneficial effect of intrinsic gettering due to precipitation of oxygen in the bulk of MOS dynamic RAM refresh performance is shown. Equivalent thermal processes result in similar circuit performance only when the silicon material is equivalent. Some circumstantial evidence is also presented for a degrading effect of high concentrations of carbon in the starting material. (29 refs.)

101983 On the solubilities of pleochroic dyes in liquid crystalline phases. J.K.Foitzik, W.Haase (Inst. fur Phys. Chem., Tech. Hochschule Darmstadt, Darmstadt, Germany).
Mol. Cryst. & Liq. Cryst. (GB), vol.97, no.1-4, p.231-40 (1983). (Proceedings of the Ninth International Liquid Crystal Conference, Bangalore, India, 6-10 Dec. 1982).
Solubilities of pleochroic dyes in the liquid crystalline phases ZLI-1565, PCH-5, PCH-7 and CCH-5 are reported. The dyes used were 1,4- and 1,5-

disubstituted anthraquinones. The authors found rather different values for the anthraquinones studied and also noteworthy temperature dependences. The enthalpies of solution were calculated. The influence of the structures of the dyes as well as of the liquid crystalline phases on the solubility and its temperature dependence is discussed. (23 refs.)

101984 Metastable two-liquid tie lines in the soda-lime-silica system. Z.Strnad (Res. & Dev. Inst. for Industrial Glass, Prague, Czechoslovakia), P.W.McMillan.
Phys. & Chem. Glasses (GB), vol.24, no.3, p.57-64 (June 1983).
A thermodynamic approach based on equating the chemical potentials of the components in the equilibrium liquid phases is applied to the calculation of metastable two-liquid tie lines and spinodal curves in the soda-lime-silica system. The calculated two-liquid tie lines in the system are compared with experimental data. The results show some disagreement between the present data and other sources concerning the composition of silica rich phase, which is generally considered as nearly pure SiO_2 at any temperature. (11 refs.)

101985 Contribution to the study of tetragonal and rhombohedral phase coexistence in the $PbZrO_3$-$PbTiO_3$ system. T.Kala (Res. Inst. of Electrotech. Ceramics, Hradec Kralove, Czechoslovakia).
Phys. Status Solidi a (Germany), vol.78, no.1, p.277-82 (16 July 1983).
Some new experimental results of the X-ray diffraction analysis of $Pb(Zr,Ti)O_3$ solid solutions with 1.5 mol.% of MnO_2 additions and the experimental data of other authors are used for the proposal of a new conception of the interpretation of the tetragonal-rhombohedral phase coexistence in the $PbZrO_3$-$PbTiO_3$ system in the vicinity of the morphotropic phase boundary. It suggests the internal stress relaxation as the primary reason of the phase coexistence. The internal stresses may arise due to the contraction or dilatation during temperature changes, due to the influence of external electric or mechanical fields, and other variables, too. (7 refs.)

101986 Monotonic and alternating surface segregation profiles in binary alloys. L.Z.Mezey, O.Nishikawa, J.Giber (Inst. of Phys., Budapest Tech. Univ., Budapest, Hungary).
Phys. Status Solidi a (Germany), vol.78, no.1, p.323-31 (16 July 1983).
A complex calculation method of the characteristics of surface segregation has been recently developed. The sufficient conditions of monotonic and alternating surface segregation profiles are established using the method. Then the monotonic profiles are related to the preference for pair formation from like atoms while the alternating ones are related with that from unlike atoms. The applicability of the conditions deduced is shown for some binary solid alloys. (16 refs.)

101987 Magnetic susceptibility and solubility limits of dilute Mn in liquid Se. J.A.Gardner (Dept. of Phys., Oregon State Univ., Corvallis, OR, USA).
Phys. Rev. B (USA), vol.28, no.4, p.2222-4 (15 Aug. 1983).
The magnetic susceptibility of dilute mixtures of Mn in Se was measured up to 1100°C. These results indicate that the solubility of Mn in liquid Se is very small, rising to only 0.19 at.% at 895°C and 0.52 at.% at 965°C. In the temperature range 900-1100°C, where the Mn solubility is large enough to permit accurate measurements, the Mn susceptibility is found to be approximately that of a free $^5/_2$ spin. The effective magnetic moment appears to be reduced only slightly by *s-d* interaction. The susceptibility of $MnSe_2$ was measured between room temperature and 950°C in the course of this work and is found to follow a Curie-Weiss temperature dependence. The effective Mn magnetic moment in $MnSe_2$ is approximately the same as a free $^5/_2$ spin. (10 refs.)

101988 Relative solubility trends in transition-metal alloys. D.A.Goodman, L.H.Bennett (NBS, Washington, DC, USA), R.E.Watson.
Alloy Phase Diagrams. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.43-52
Describes the relative solubilities of the transition metals in one another. After discussing the problem of defining an appropriate measure of solubility for the transition-metal alloys which have any intermediate phases, the authors present a map of relative solubilities for the transition metals. From this map, they delineate the trend which occurs. Both the Engel-Brewer theory and d-band transition-metal alloy theory are consistent with this trend. (25 refs.)

101989 Coherent precipitate formation in pulsed-laser and thermally-annealed, ion-implanted Si. B.R.Appleton, J.Narayan, O.W.Holland, S.J.Pennycook (Solid State Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.281-6
It is shown that under suitable conditions ion implanted impurities in Si can precipitate and grow coherently within the single crystal lattice during recrystallization induced by pulsed laser or thermal annealing. Ion channeling and transmission electron microscopy (TEM) were used to characterize such precipitates in Si implanted with Sb and B and thermally annealed, and in Si implanted with Tl and annealed with a pulsed ruby laser. The orientations of these precipitates were determined from TEM and detailed angular scans using ion scattering channeling. The nucleation and precipitation processes are discussed in terms of differences in the liquid and solid phase regrowth mechanisms. (18 refs.)

101990 Segregation and crystallization phenomena in germanium. G.J.Clark (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA), A.G.Cullis, D.C.Jacobson, J.M.Poate, M.O.Thompson.
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.303-10
While many studies have been made of liquid phase epitaxy impurity trapping and segregation in Si little is known about the equivalent processes in Ge. In this paper the authors have laser annealed Ge⟨100⟩ and ⟨111⟩ crystals implanted, at liquid nitrogen temperature, with 200 keV ^{210}Bi ions to doses of 2×10^{15} and 10^{16} ions cm^{-2}. The samples were annealed with Q-switched ruby lasers and an XeCl excimer laser. They have observed (1) velocity and orientation dependence of the Bi segregation coefficient, (2) interface instability and cell formation resulting from constitutional supercooling, and (3) amorphization and defect production at high velocities. The phenomena are shown to be analogous to those seen in Si. (15 refs.)

64.80 OTHER PHASE PROPERTIES OF SYSTEMS

101991 Homogeneity of semi-insulating GaAs substrates for GaAs IC. S.Miyazawa (Nippon Telegraph & Telephone Public Corp., Musashino, Japan).
Oyo Buturi (Japan), vol.52, no.3, p.227-31 (March 1983). In Japanese.
Impressive attention has been given to, as a new substrate material after Si, the GaAs compound, for the reason that it is high (about 6 times) in electron mobility more than 10^7 Ω.cm. Considerable research has been done on the development of large-diameter (2 to 3 inches) GaAs substrates using the liquid encapsulated Czochralski technique. The LEC crystal has its characteristic uniformity in the dislocation density distribution. This review introduces results of the recent research on the correlation between the nonuniformity and crystal quality or FET characteristics and articulates that the uniform distribution of the dislocation density is indispensible for GaAs integrated-circuit fabrication. (20 refs.)

101992 Star patterns and dissociation of interfaces without spontaneous strain compatibility between orientation domains in ferroelastic crystals. Case of a monoclinic rare earth sesquioxide. C.Boulesteix (Lab. de Microscopie Electronique Appl., Faculte des Sci., Marseille, France), B.Yangui.
Phys. Status Solidi a (Germany), vol.78, no.1, p.303-8 (16 July 1983).
In some cases no interface with a strain compatibility (permissible interface) can occur between orientation domains in ferroelastic crystals. Non-permissible interfaces may then occur. Such interfaces are observed in monoclinic Sm_2O_3 at the external point of star patterns which can be observed in ferroelastics occurring with the loss of a triad axis. It is shown that such non-permissible interfaces can dissociate into two twins which is at the origin of the formation of star patterns. This dissociation, similar to the dissociation of antiphase boundaries or dislocations, occurs because it reduces the total free energy of the crystal. (12 refs.)

101993 On the dynamics of low-temperature domains above T_c in lead phosphate. C.N.W.Darlington (Dept. of Phys., Univ. of Birmingham, Birmingham, England).
Phase Transitions (GB), vol.3, no.4, p.283-92 (1983).
Results derived from the scattering of Mossbauer γ-rays from lead phosphate, $Pb_3(PO_4)_2$, at temperatures above the transition temperature (180°C) are consistent with the idea that the crystal contains regions which have the symmetry of the low-temperature, ferroelastic phase. These microdomains are either very long-lived, a result which is inconsistent with findings from neutron scattering experiments reported in the literature, or have lifetimes which are considerably shorter than 10^{-7} seconds. 65.20 HEAT CAPACITIES OF LIQUIDS

101994 The Anderson-Gruneisen parameter of the liquid state and its relation with Rao's acoustical parameter. B.K.Sharma (Dept. of Phys., Regional Coll. of Education, Bhubaneswar, India).
Acustica (Germany), vol.53, no.3, p.152-8 (July 1983).
The significance of and the distinction between the microscopic Gruneisen parameter and the thermodynamic Gruneisen parameter is discussed. By demonstrating the similarity of these parameters in case of simple liquids, an expression for the heat capacity ratio of liquids has been obtained. The study of the isothermal and the adiabatic Gruneisen parameter is extended to the liquid state and their relationships whith the microscopic Gruneisen parameter and the Rao acoustical parameter are established by taking into consideration the contribution due to the temperature dependence of the adiabatic compressibility and the heat capacity ratio. It is shown that values of Rao's acoustical parameter are found around 2 and those of the Anderson-Gruneisen parameters around 5 for simple liquids. The values of the isothermal and the adiabatic Anderson-Gruneisen parameters are very close, differing by about 10% only in case of simple liquefied gases. These parameters are found temperature dependent and decrease with rise of temperature, like the microscopic Gruneisen parameter for liquids. (62 refs.)

101995 Unusual glassy smectic-G liquid crystal: heat capacity of N-p-n-pentyloxybenzylidene-p′-n-butylaniline between 11 and 393K. M.Sorai, K.Tani, H.Suga (Dept. of Chem., Osaka Univ., Osaka, Japan).
Mol. Cryst. & Liq. Cryst. (GB), vol.97, no.1-4, p.365-86 (1983). (Proceedings of the Ninth International Liquid Crystal Conference, Bangalore, India, 6-10 Dec. 1982).
The heat capacities of the title compound ($C_5H_{11}O$-C_6H_4-CH=N-C_6H_4-C_4H_9, abbreviation 5O.4) with a purity of 99.92 mole percent have been measured with an adiabatic-type calorimeter between 11 and 393K. The transition temperature and the enthalpy and entropy of phase transition for stable crystal→S_G, S_G→N and N→isotropic liquid were $T_c=299.69K/\Delta H=22.68$ kJ $mol^{-1}/\Delta S=75.70$ J K^{-1} mol^{-1}, 325.72/7.11/21.79 and 342.48/1.78/5.22, respectively. The crystal which melts at 285.5K is a metastable modification. The S_A phase hitherto reported in between S_G and N does not exist. The glassy S_G state was realized by rapid cooling of the specimen from the S_G phase. The molar enthalpy of the glassy S_G state at 0K was by (10.1 ± 0.1) kJ mol^{-1} higher than that of the stable crystalline state and the residual entropy of the glassy state was (9.40 ± 0.83) J K^{-1} mol^{-1}. The relaxational heat-capacity anomaly was observed from as low as 100K and double glass transition phenomenon occurred around 200K; a quite unusual phenomenon which has never been observed for the glassy states of nematic and cholesteric liquid crystals. (28 refs.)

65.40 HEAT CAPACITIES OF SOLIDS

(for specific heat of superconductors, see 74.30E; for specific heat of magnetic systems, see 75.40)

101996 Calculation of electronic specific heat by the collective electron oscillations in metals and their different phases. O.K.Harsh, Y.D.Kaushik, R.P.Sharma (Dept. of Post-graduate Studies & Res. in Phys., Feroze Gandhi Coll., Rae Bareli, India).
Indian J. Phys. Part B, vol.57B, no.1, p.92-4 (Feb. 1983).
An interesting method is proposed to calculate the electronic specific heat of metals using collective behaviour of electrons. The present method explains first time the specific heat of the different phases of the same metal and it also calculates the specific heat of those metals for which the calculations have not been performed so far. The calculated values are in excellent agreement with the observed value. (5 refs.)

101997 Heat capacity of the solid electrolyte $Ag_{26}I_{18}W_4O_{16}$. P.G.Hall, D.A.Armitage, R.G.Linford (School of Chem., Leicester Polytech., Leicester, England).
J. Phys. C (GB), vol.16, no.23, p.L835-7 (20 Aug. 1983).
The heat capacity of the solid electrolyte $Ag_{26}I_{18}W_4O_{16}$ has been determined between 78 and 300K by adiabatic calorimetry. Three transitions occur, two first order (198.5 and 248.6K) and another more gradual transition producing a lambda-shaped peak at 275.6K. The results agree well with those of an earlier study by differential scanning calorimetry. (8 refs.)

101998 Influence of thermal treatments on the low temperature specific heat of Suprasil-W vitreous silica. M.Grosmaire-Vandorpe, J.C.Lasjaunias, G.Penn (Centre de Recherches sur les Tres Basses Temperatures, CNRS, Grenoble, France).
J. Non-Cryst. Solids (Netherlands), vol.57, no.1, p.157-66 (Aug. 1983).
The authors report specific heat results between 0.04 and 4K in Suprasil-W vitreous silica submitted to thermal treatments at 1100 and 1300°C, on samples of different sizes. In the very low temperature range, i.e. below 0.5K, the specific heat mainly due to the two-level systems is only slightly sensitive to the annealing. On the contrary, the large anomaly localized at 1-2K is very sensitive to the conditions of the thermal treatments and to the shape of samples. Comparison is made with a similar anomaly induced in crystalline quartz by fast neutron irradiation at moderate doses. (28 refs.)

101999 Specific-heat measurements of Pd in magnetic fields to 20 T. G.R.Stewart (Los Alamos Nat. Lab., Los Alamos, NM, USA), B.L.Brandt.
Phys. Rev. B (USA), vol.28, no.4, p.2266-7 (15 Aug. 1983).
The authors report accurate measurements of the specific heat of zone-refined, high-purity Pd between 6 and 17K in fields of 10, 15, and 20 T. The change of the specific heat of this Pd in 20 T, averaged over the 14 different temperatures of measurement, compared with zero-field measurements at the same temperatures, is +1.0%. Within the limits of error (±2%), the results directly contradict previous specific-heat results on Pd in fields to 11 T by Hsiang et al. (Phys. Rev. Lett. 47, 523, 1981). (12 refs.)

102000 Heat capacity and thermal conductivity of semiconducting $PtSb_2$ in the range 4.2-300K. J.P.Kundrotas, A.Dargyys (Inst. of Semiconductor Phys., Acad. of Sci., Lithuanian SSR).
Sov. Phys.-Collect. (USA), vol.22, no.2, p.56-62 (1982). Translation of: *Litov. Fiz. Sb. (USSR)*, vol.22, no.2, p.74-82 (1982).
The thermal conductivity and heat capacity of the narrow-band semiconductor $PtSb_2$ has been measured at constant pressure, from room to liquid-helium temperatures. It is found that the Debye temperature is close to 300K and varies only slightly with the lattice temperature. It is established that in some single crystals (impurity concentration 10^{17} cm^{-3}) the thermal conductivity attains its maximum value of 4 W/(cm.K) at around 20K. Comparison of theory and experiment yields the conclusion that at low temperatures phonons are scattered by impurities; with increasing temperature the thermal conductivity is due to three-phonon scattering, while at room temperature it is due to both phonons and current carriers, whose contribution amounts to around 25% of the overall thermal conductivity $\lambda_{800}=0.4$ W/(cm.K). 65.50 THERMODYNAMIC PROPERTIES AND ENTROPY

102001 The calculation of molecular interaction in phosphoryl chloride. S.S.Bhatti (Dept. of Phys., Guru Nanak Dev Univ., Amritsar, India).
Acustica (Germany), vol.53, no.3, p.166-8 (July 1983).
Presents results of certain acoustical and thermodynamical parameters calculated for liquid phosphoryl chloride on the basis of a hard-sphere model with attractive interactions as proposed by Sharma (1979). The pseudo-Gruneisen parameter $\Gamma_G(=u^2\alpha/Cp)$ is compared with the microscopic (lattice) Gruneisen parameter $\Gamma(x)$, and the β-value directly obtained ultrasonically is compared with that calculated from the above model. In addition, surface tension (S), surface energy (E) Eotvos constant (K_E), disorder (δ) and viscosity coefficients (η) and the change in entropy ($\Delta\phi$) have been derived. The variation of free volume (V_f) and the relative association (RA) also have been studied. (20 refs.)

102002 Concentrated aqueous sodium chloride solutions from 200 to 600°C and to 3000 bar. Phase equilibria and *PVT*-data. M.Gehrig, H.Lentz, E.U.Franck (Inst. fur Phys. Chem. und Elektrochem., Univ. Karlsruhe, Karlsruhe, Germany).
Ber. Bunsenges. Phys. Chem. (Germany), vol.87, no.7, p.597-600 (July 1983).
The specific volume of aqueous sodium chloride solutions with 6, 10, and 20 weight percent salt was measured from 200°C to 600°C and from 100 bar to 3000 bar. The uncertainty of the data is below 0.5%. Data are given of temperature, presssure, volume and composition at 24 points on the two-phase boundary surface. About 230 values for the one-phase region are presented. The critical curve for the binary system runs from 374°C and 220 bar for pure water to 500°C and nearly 600 bar for a solution with 12% salt. The specific volume at this point is $2.0\ cm^3\ g^{-1}$. At 600°C, 3000 bar and 20% salt a volume of $1.163\ cm^3\ g^{-1}$ was found. The apparatus and procedure, which uses an autoclave with variable volume and a sapphire window is described. (22 refs.)

102003 An investigation into individual activity coefficient in electrolyte solution. II. The evaluation of individual ionic activity coefficient in mixed electrolyte solution. Huang Rui-he, Teng Teng, Li Yi-gui (Dept. of Chem. & Chem. Engng., Tsinghua Univ., China).
J. Tsinghua Univ. (China), vol.23, no.1, p.73-80 (1983). In Chinese.
For pt.I see ibid., vol.22, no.4, p.33 (1982). By using the measured individual ionic activity coefficient data in the previous paper and the experimental mean ionic activity coefficient data in a single electrolyte solution (1-1 valence), a method for evaluating the individual ionic activity coefficient of any ion mixed electrolyte solution (such as Na^+, K^+, Cl^- and Br^-) is developed. (5 refs.)

102004 A note on the entropy of the disordered harmonic chain. S.Baer (Dept. of Phys. Chem., Hebrew Univ. of Jerusalem, Jerusalem, Israel).
J. Phys. C (GB), vol.16, no.21, p.4103-6 (30 July 1983).
It is shown that in the classical limit the entropy of disorder in the harmonic chain of particles with masses M_i and nearest-neighbour force constants $K_i(\langle K/M\rangle=1)$ is given by $S_{dis}=-Nk_B\langle\log(K/M)^{1/2}\rangle$ (average over chain) compared with the standard expression $S_{dis}=-Nk_B\langle\log\ \omega\rangle$ (average over normal modes). (10 refs.)

102005 A thermodynamic study of (magnesium oxide+silicon dioxide) by mass spectrometry. S.Kambayashi, E.Kato (Dept. of Metall. Engng., Waseda Univ., Tokyo, Japan).
J. Chem. Thermodyn. (GB), vol.15, no.8, p.701-7 (Aug. 1983).
The thermodynamic activities of $\{(1-x)MgO+xSiO_2\}$ were measured at 1873K by high-temperature mass spectrometry. The standard molar Gibbs free energies of formation of $MgSiO_3(l)$ and $Mg_2SiO_4(s)$ from $SiO_2(s)$ and $MgO(s)$ at 1873K were determined to be $-(31.5\pm0.6)\ kJ\times mol^{-1}$ and $-(56.8\pm0.6)\ kJ\times mol^{-1}$, respectively. A liquid phase was observed for $x=0.448$ to 0.565 at 1873K. (13 refs.)

102006 The excess enthalpies of (carbon dioxide+toluene) at 308.15, 385.15, and 413.15K from 7.60 to 12.67 MPa. C.Pando, J.A.R.Renuncio, R.S.Schofield, R.M.Izatt, J.J.Christensen (Dept. of Chem. Engng., Brigham Young Univ., Provo, UT, USA).
J. Chem. Thermodyn. (GB), vol.15, no.8, p.747-55 (Aug. 1983).
The excess molar enthalpies ${H_m}^E$ for $\{xCO_2+(1-x)C_6H_5CH_3\}$ were measured in the vicinity of their critical locus and in the supercritical region. Mixtures at 308.15K and at 7.60 MPa show very exothermic mixing and a region where ${H_m}^E$ varies linearly with x, while at 10.64 and 12.67 MPa they show only moderately endothermic and exothermic mixing in the toluene-rich and carbon-dioxide-rich regions, respectively. Mixtures at 358.15 and 413.15K and at all pressures studied have an exothermic section in the toluene-rich region, a linear section (corresponding to a two-phase region) which starts at an x corresponding very closely to that at the minimum value of ${H_m}^E$ (maximum exothermic mixing), and an endothermic section in the carbon-dioxide-rich region. The ${H_m}^E$ values were used to determine the equilibrium phase compositions in the two-phase region. These compositions were found to be in excellent agreement with those obtained by a non-calorimetric procedure. The changes observed in the excess enthalpy with both pressure and temperature are discussed in terms of liquid-vapor equilibrium and critical constants for (carbon dioxide+toluene). (12 refs.)

102007 Thermodynamics of liquid (potassium+potassium bromide) at high temperatures. P.Kozoulia, J.P.Bros, M.Gaune-Escard (Lab. de Dynamique et Thermophys. des Fluides, Univ. de Provence, Marseille, France).
J. Chem. Thermodyn. (GB), vol.15, no.8, p.757-71 (Aug. 1983).
The vapour pressure above $\{xK+(1-x)KBr\}(l)$ was measured at the mole fractions $x=0.1$, 0.2, 0.3, 0.4, 0.5, 0.6, 0.7 and 0.8, and at temperatures higher than the critical temperature ($1000K<T<1065K$). The activities of K and of KBr were obtained in this temperature range; hence, the thermodynamic excess molar functions ${G_m}^E$ and ${H_m}^E$ were derived. The experimental activities of K were found to be in good agreement with those, obtained in a more limited composition range, by Smirnov et al. The excess molar Gibbs free energies can be compared with those deduced from a phase-diagram analysis. Moreover, the value obtained for the limiting molar enthalpy of solution of K supported the estimate given by Pitzer from an F-centre model. (22 refs.)

102008 Thermodynamic investigation of (a transition metal+germanium or silicon). II. (Palladium+silicon) alloys. R.Castanet, R.Chastel, C.Bergman (Centre de Thermodynamique et de Microcalorimetrie, CNRS, Marseille, France).
J. Chem. Thermodyn. (GB), vol.15, no.8, p.773-7 (Aug. 1983).
For pt.I see ibid., vol.14, p.639 (1982). The molar enthalpy of formation $\Delta_f H_m$ of the liquid alloys $\{xPd+(1-x)Si\}$ at 1723K was measured by direct reaction calorimetry (drop method) using a very high-temperature Seteram calorimeter. The molar entropy of formation was deduced by combining $\Delta_f H_m$ with the molar Gibbs free energy of formation obtained by (Knudsen effusion+mass spectrometry) and published elsewhere. (9 refs.)

102009 An estimation of the thermodynamic data of liquid transition metal based alloys. A.Pasturel, P.Hicter (Lab. de Thermodynamique et Phys.-Chimie Metallurgiques, Ecole Nat. Superieure d'Electrochimie et d'Electrometallurgie de Grenoble, St. Martin d'Heres, France), D.Mayou, F.Cyrot-Lackmann.
Scr. Metall. (USA), vol.17, no.7, p.841-6 (July 1983).
The thermodynamic data of transition metal-polyvalent metal alloys is interpreted from the filling of the d-band of the transition metal as it is alloyed with polyvalent metal. The alloying effect being essentially a chemical effect, a rigid band model is used in first approximation. The sp electrons are described by the free electron model while the d electrons are described in the tight binding approximation; more precisely, the density of d states was described using various geometrical models in conjunction with a moments technique. This approach enables the entropy and the enthalpy of mixing of these alloys to be determined simultaneously; it is shown, though the topological effect is of minor importance in these alloys, that the entropy of mixing is very sensitive to the shape of the density of d states. (14 refs.)

102010 Entropy of glassy and crystalline lithium acetate in relation to the Kauzmann paradox. N.O.Gonchukova (I.V. Grebenshchikov Inst. of Silicate Chem., Acad. of Sci., Leningrad, USSR).
Sov. J. Glass Phys. & Chem. (USA), vol.8, no.4, p.291-5 (July-Aug. 1982). Translation of: *Fiz. & Khim. Stekla (USSR)*, vol.8, no.4, p.429-34 (July-Aug. 1982). [received: May 1983]
On the basis of the results from measurements of the thermal capacity of lithium acetate the behavior of the entropy of a glass-forming liquid in the region of T_0, the temperature below which the extrapolated entropy becomes less than that of a crystal (Kauzmann's paradox), has been studied. It has been established that the entropy of the liquid decreases monotonically with temperature but remains greater than that of the crystal. (13 refs.)

102011 Connection between the excess thermodynamic functions of glassy As_2S_3 and As_2Se_3 at absolute zero and their structural features. S.V.Nemilov (S.I. Vavilov State Optical Inst., Leningrad, USSR).
Sov. J. Glass Phys. & Chem. (USA), vol.8, no.4, p.320-5 (July-Aug. 1982). Translation of: *Fiz. & Khim. Stekla (USSR)*, vol.8, no.4, p.465-71 (July-Aug. 1982). [received: May 1983]
The data on the thermal capacity of crystalline As_2S_3 above 300K, the values of the heat of the phase change in As_2S_3 at 471K, and the heat of melting have been refined. Using the data obtained in the literature and extrapolating the thermal capacities of As_2S_3 and As_2Se_3 to 0K in accordance with the thermal quantum theory of the thermal capacity of chain structures, the values of the entropy excess in relation to the crystal and of the free energy of As_2S_3 and As_2Se_3 glasses at 0K have been calculated. It is established that in the structural and energetic senses, glassy As_2S_3 is closer to the crystalline state than As_2Se_3. The latter circumstance is in good agreement with te results of an X-ray study and can be explained by the greater destruction of the layers in glassy As_2Se_3 than in As_2S_3. It is shown that the case of glassy B_2O_3, As_2S_3, and As_2Se_3 there is a correlation between the thermodynamic parameters ξ and λ which determine the closeness of the structure and energy in a glass and crystal, on the one hand, and the ratio of the free activation energies of viscous flow of these glasses below T_g to the rupture energy of the bridging bonds (E_η^*, T_g/E_d) which determine the degree of spatial branching of the framework, on the other. It is suggested that the greater retention in the glass structure of the laminar formations characteristic of a crystal correspond to larger ξ and λ and to smaller E_η^*, T_g/E_d. (29 refs.)

102012 The representation of thermodynamic properties in multicomponent alloys. I.Ansara (Lab. de Thermodynamique et Phys.-Chimie Metall., ENSEEG, Saint Martin d'Heres, France).
Alloy Phase Diagrams. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.107-14
In addition to theoretical models which have been developed to interpret the interactions in metallic systems, polynomials of different types have been used to represent the thermodynamic properties of solution phases. Ternary and higher order systems have been described by adding the properties of the limiting binary systems, using various summation methods; interaction parameters specific to the multicomponent systems can be derived from sufficiently precise experimental measurements. (25 refs.)

102013 The sublattice model. B.Sundman, J.Agren (Div. of Phys. Metall., Royal Inst. of Technol., Stockholm, Sweden).
Alloy Phase Diagrams. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.115-27
A thermodynamic model, based on the regular solution approximation is presented and a formalism, suitable for phases with an arbitrary number of elements and sublattices is described. A new concept, the component array, is introduced in order to simplify the analytical expressions for the Gibbs energy. The mathematical complexity of the model has been solved by the implementation of the model as a part of a general software system for thermochemical and phase diagram calculations by computer. The sublattice model is suitable for describing phases where the difference in size, charge or electronegativity causes a deviation from random mixing of the atoms in a manner which can be described as long range order. This is the case for interstitial solutions and many intermetallic phases, but also for ionic liquids and slag systems. The application of the model to several alloy systems is described. (11 refs.)

102014 Mathematical representation of size and electronic factors. L.Brewer (Dept. of Chem., Univ. of California, Berkeley, CA, USA).
Alloy Phase Diagrams. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.129-34
The relative sizes of the atoms and their electronic configurations are important factors in determining the thermodynamic properties of metallic phases. The regular solution model provides for an asymmetric excess Gibbs energy when they is a size difference, but the actual degree of asymmetry does not correspond to crystallographic sizes. This is due in part to the effect of electronic configurations upon the asymmetry of the Gibbs energy. The Hume-Rothery Rules indicate that the BCC, HCP, and CCP structures are associated with characteristic outer-shell electron per atom concentrations. The electronic factors require modification of the usual definition of internal

pressure as used in the regular solution theory. Rather than using the energy of vaporization to the ground atomic state, the energy of vaporization to the valence state atom, which has the same electronic configuration as in the condensed state, is a more appropriate measure of the degree of cohesion and the internal pressure. The problems of providing mathematical expressions that accommodate the contributions of internal pressure, electronic factors, and size factors are discussed. (18 refs.)

102015 A pair-wise interaction model for multi-sublattice phases. J.N.Pratt, I.P.Jones (Dept. of Metall. & Materials, Univ. of Birmingham, Birmingham, England).
Alloy Phase Diagrams. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.135-48
The use of simple nearest neighbour pair-wise interaction models for the description of the thermodynamic properties of ordered alloys is reviewed and extended to the treatment of phases containing several sublattices. Employing individual sublattice occupation parameters to define atomic distributions, enthalpies corresponding to these are described by the summation of pair-wise interaction energies over all the resulting first coordinate shell neighbours. Invariant like and unlike bond energies are assumed, their respective values being estimated using heats of vaporisation of the elements and a heat of formation of the phase at a single composition. Combination of the enthalpies with corresponding configurational entropies yields an expression for the free energy of the phase which may be minimised with respect to variation of the sublattice occupation parameters. This leads to the prediction of the stable atomic distributions and the variation of these and the thermodynamic properties with composition. The application of the model to sigma phases and other multi-sublattice structures is discussed. (42 refs.)

102016 Association model for liquid alloys. F.Sommer (Max-Planck-Inst. fur Metallforschung, Stuttgart, Germany).
Alloy Phase Diagrams. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.163-73
The concentration and the temperature dependence of thermodynamic mixing functions of liquid alloys with compound formation tendency, which often exhibit large deviations from a regular behaviour, can be calculated according to an association model using only a few parameters which have a definite physical significance. The results obtained for binary and ternary alloy melts with one or more, simultaneously occurring, binary or ternary associates are in good accordance with the experimental values. For the calculation of phase diagrams, the association model enables a correct extrapolation into concentration and temperature regions for which no experimental results are available. The occurrence and the borderline of miscibility gaps in liquid alloys with strong compound forming tendency can be quantitatively described. (19 refs.)

102017 Prediction of solid+liquid equilibrium diagrams for binary mixtures forming solid solutions with an extremum. W.Brostow, M.A.Macip (Dept. of Materials Engng., Drexel Univ., Philadelphia, PA, USA).
Alloy Phase Diagrams. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.217-22
Convenient methods of correlation and prediction of S+L diagrams exist only for systems forming eutectics. To deal with solid solutions, the model of strictly regular solutions of Guggenheim (1966) was adopted. The key assumption is that values of the Gibbs function of interchange w are different in the two coexisting phases: w_S and w_L. The assumption is based on the fact that the average interatomic distances $\bar{R}$ are also different, and this affects the averages of the interatomic (or intermolecular) potentials. The input parameters are enthalpies and temperatures of melting of pure components and any pair of experimental points on the diagram. For a number of binary alloy systems the agreement with the experiment is good. Calculations have also been made for organic mixtures, again with good results. (17 refs.)

102018 The calculation of free energies using computer simulation. N.Quirke (Dept. of Chem., Royal Holloway Coll., Egham, England).
Physics of Superionic Conductors and Electrode Materials. Proceedings of a NATO Advanced Study Institute on the Physics of Superionics Conductors and Electrode Materials, Odense, Denmark, 4-22 Aug. 1980 (New York, USA: Plenum Press 1983), p.197-210
For most constraints of interest, the thermodynamic potential or free energy of a system cannot be expressed as an average of a function of the microscopic variables and cannot therefore be calculated from a computer simulation in the same manner as the energy or pressure. Nevertheless, methods can be devised that enable free energies to be calculated from the results of computer simulations and the article briefly reviews some aspects of current work in this field. 65.70 THERMAL EXPANSION AND THERMOMECHANICAL EFFECTS

(see also 64.30 Equations of state; for electronic thermal conduction, see 72.15 and 72.20; for thermal conductivity of superconductors, see 74.30E; for pyroelectric and electrocaloric effects, see 77.70)

102019 The effect of moisture on the expansion behaviour and thermal strains in GRP. F.R.Jones, M.Mulheron (Dept. of Metall. & Materials Technol., Univ. of Surrey, Guildford, England).
Composites (GB), vol.14, no.3, p.281-7 (July 1983). (Symposium on Environmental Effects on Fibre-Reinforced Plastics, London, England, 12-13 July 1983).
The temperature dependence of the linear expansion coefficients in the longitudinal (α_l) and transverse directions (α_{t1} and α_{t2}) of unidirectional glass fibre laminates and their matrix resins have been studied. A moisture phenomenon in the form of peaks in the $\alpha_m\ (T)/T$, $\alpha_t(T)/T$ and $\tan \delta/T$ curves for fully cured polyester resins and laminates has been identified. This observation accounts for the higher experimental thermal strains in polyester crossply laminates. An epoxy resin based laminate was insensitive to water within the timescale of the experiments. A difference between $\alpha(t_1)$ and $\alpha(t_2)$ has also been observed for partially cured polyester laminates, which is also perturbated by the presence of water. Both moisture effects are considered to result from a two-phase polyester matrix which continues to cure below the softening point of the resin. (12 refs.)

102020 Isobaric expansivity of liquids and its dependence on temperature. W.Brostow (Dept. of Materials Engng., Drexel Univ., Philadelphia, PA, USA), E.M.del Rocio Enriquez, A.L.Espiritu.
Mater. Chem. & Phys. (Switzerland), vol.8, no.6, p.541-52 (June 1983).
A number of relations between the isobaric expansivity α and temperature T have been studied, including the original Mendeleiev equation (1860), a modification of it proposed by the authors, and two versions of the Guggenheim-Lu-Ruether equation. Reliable experimental data for argon, mercury and a series of paraffins have been used for testing the relations. The generalized Mendeleiev formula provides satisfactory results. Even better ones are obtained from the Guggenheim-Lu-Ruether equation, provided the two parameters of the equation are not related to the acentric factor. Changes of these two parameters in the paraffin series related to chain conformations are discussed. (30 refs.)

102021 Anomalies of thermal expansion of solid solutions of iron in α-manganese. I.A.Nikanorova, A.S.Ilyushin (M.V. Lomonosov State Univ., Moscow, USSR).
Fiz. Met. & Metalloved. (USSR), vol.55, no.6, p.1215-17 (June 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
A study was made of thermal expansion in the temperature range 15-300K in order to determine the relationship between the thermal properties, on the one hand, and the magnetic properties and long-range order on the other. A correlation was found between the Neel temperature and the long-range order coefficient representing the local distribution of iron atoms in the complex structure of α-manganese. (13 refs.) *A.T.*

102022 Thermal expansion anomalies of solid argon due to oxygen impurities. A.M.Tolkachev, V.G.Manzhelii, E.A.Kosobutskaya, A.N.Aleksandrovskii.
Fiz. Nizk. Temp. (USSR), vol.9, no.7, p.737-44 (July 1983). In Russian. English translation in: *Sov. J. Low Temp. Phys. (USA)*
The linear expansion coefficients (LEC) of solid argon with 0.5, 1.0 or 3.0% O_2 are measured in the temperature range of 2 to 12K. The analysis of the concentration dependence of LEC indicates that in the concentration range between 1.85 and 3.4% O_2 there exists a two-phase region (supposedly a FCC-HCP one). Temperature dependences of an excess LEC ($\Delta\alpha$) in the FCC-phase are given by Schottky's curves with two-fold degenerate upper level and the splitting equal to 4.0 and 4.4K for solutions with 0.5 and 1%O_2, respectively. At low temperatures, the values of $\Delta\alpha$ appear to be unusually large, an order of magnitude larger than would be expected from the analysis of the energy spectrum of an oxygen molecule being in a cubic crystalline field. Using the temperature dependence of LEC in the two-phase region, the excess LEC of the HCP-phase is calculated. (22 refs.)

102023 X-ray study of the thermal expansion in $CuAlS_2$, and $CuGaS_2$, and $CuInS_2$ compounds over the temperature range from 90 to 650K. I.V.Bodnar, N.S.Orlova (Inst. of Phys. of Solids & Semiconductors, Acad. of Sci., Minsk, Belorussian SSR).
Phys. Status Solidi a (Germany), vol.78, no.1, p.K59-63 (16 July 1983).
The authors investigate the temperature dependence of the lattice parameters a and c, of the c/a axial ratio and determine the principal coefficients of thermal expansion for the $CuAlS_2$, $CuGaS_2$, and $CuInS_2$ compounds. (6 refs.)

66.10 DIFFUSION AND IONIC CONDUCTION IN LIQUIDS

102024 A statistical mechanical theory of the self-diffusion coefficient of simple ions in electrolyte solutions. Chung Yuan Mou (Dept. of Chem., Nat. Taiwan Univ., Taipei, Taiwan), T.S.Thacher, Jeong-long Lin.
J. Chem. Phys. (USA), vol.79, no.2, p.957-63 (15 July 1983)
A statistical mechanical theory of the self-diffusion coefficient of ions in solutions of simple electrolytes has been developed. Beginning with a generalised Langevin equation the self-diffusion coefficients of ions may be evaluated at the zero-frequency limit of the Laplace transform of the random force correlation function. The authors assume that the random force acting on the tagged ion may be separated into contributions from the solvent part, due to the surrounding solvent molecules and an ionic part due to all the other ions. Further, they assume that the evolution of the ionic random force is governed by the Smoluchowski operator. With these assumptions and using the Debye-Huckel pair correlation function, the Onsager limiting law may be derived. Numerical calculations using the HNC pair correlation function shows that the authors' theory can describe experimental data of moderately concentrated solutions adequately. (18 refs.)

102025 Diffusion and mixing of passive impurities in a linear velocity field. V.P.Kabashnikov, A.A.Kurskov (Inst. of Phys., Acad. of Sci., Minsk, Belorussian SSR).
J. Eng. Phys. (USA), vol.43, no.6, p.1343-9 (Dec. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.6, p.924-31 (Dec. 1982).
The mixing process is described by a Lagrangian Green's function. The latter is obtained at both the dynamical and the statistical levels, which permits application of the results to turbulent media. (14 refs.)

102026 Temperature dependence of self diffusion in liquid metals. R.P.Chhabra (Dept. of Chem. Engng., Univ. Coll. of Swansea, Swansea, Wales), T.Sridhar.
Phys. & Chem. Liq. (GB), vol.13, no.1, p.37-46 (1983).
After presenting a brief summary of previous work, Hildebrand's fluidity model (1977) for the liquid state has been combined with a general equation for self diffusion in liquids to elucidate the temperature dependence of self diffusion in liquid metals. The analytical form for the temperature dependence presented herein is obeyed by the sixteen metals for which experimental values of self diffusion coefficient at various temperatures are available in literature. A method for predicting self diffusion in liquid metals is suggested. (27 refs.)

102027 Algorithm for eliminating the systematic error in measuring the diffusion coefficient in liquid metals. S.L.Gol'dshteyn, S.P.Raspopin, G.B.Smirnov.
Russ. Metall. (GB), no.4, p.70-5 (1981). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.4, p.80-5 (1981). [received: June 1983]
An algorithm is proposed for eliminating from experimentally determined diffusion coefficients those with a considerable convection component. The algorithm is based on the assumption that the diffusion coefficients, both in the case of purely molecular-atomic and, in the case of convection diffusion has a normal distribution, as well as a knowledge of their range of possible values. Use of this algorithm gives unique information on the hydrodynamic state of the phase of the liquid metal. The effectiveness of the algorithm is illustrated by examples of the analysis of experimental data obtained for the Ce-Al, V-Zn, Mn-Zn systems. (4 refs.)

102028 Relationship between electrical conductivity, self-diffusion coefficients and ionic composition of alkali metal halide melts. V.A.Khokhlov, M.V.Smirnov (Inst. of Electrochem., Acad. of Sci., Sverdlovsk, USSR).
Sov. Electrochem. (USA), vol.18, no.10, p.1221-5 (Oct. 1982). Translation of: *Elektrokhimiya (USSR)*, vol.18, no.10, p.1373-8 (Oct. 1982).
Relationships are proposed which connect electrical conductivity and the self-diffusion coefficients of the component units of alkali metal halide melts with their ionic composition. The self-diffusion coefficients and transference numbers of the component units calculated on the basis of the auto-complex model of the structure of alkali metal halide melts from the experimental values of their electrical conductivity are in better agreement with the experimentally determined values than those found on the assumption of the simple ionic composition of these melts. (27 refs.)

102029 Diffusion of hydroxyl in alkali borate melts. P.I.Buler, T.A.Lisina, G.A.Toporishchev (S.M. Kirov Urals Polytech. Inst., Sverdlovsk, USSR).
Sov. J. Glass Phys. & Chem. (USA), vol.8, no.4, p.330-4 (July-Aug. 1982). Translation of: *Fiz. & Khim. Stekla (USSR)*, vol.8, no.4, p.478-83 (July-Aug. 1982). [received: May 1983]
A chronopotentiometric method has been used to determine the diffusion coefficient of hydroxyl (D_{OH}) in potassium, sodium, and lithium borate melts at 850-950°C. It is shown that the diffusion mobility of the hydroxyl depends largely on the composition of the melt; with 20-25 mole% R_2O there is a sharp increase in D_{OH}. The activation energy of diffusion increases with a decrease in the cation radius of the alkali metal and is 120-180 kJ/mole. The connection between the viscosity of the melt and the diffusion coefficients of the hydroxyl are more complex than the Stokes-Einstein equation requires. With 10-15 mole% K_2O and Na_2O, D_{OH} increases together with viscosity. The experimental data suggest that the hydroxyl diffuses in the form of autonomous OH groups. (12 refs.)

66.20 DIFFUSIVE MOMENTUM TRANSPORT
(inc. viscosity of liquids)

102030 Comparisons between experimental argon and Lennard-Jones 12:6 shear viscosities. D.Fincham (DAP Support Unit, Queen Mary Coll., Univ. of London, London, England), D.M.Heyes.
Chem. Phys. (Netherlands), vol.78, no.3, p.425-41 (1 Aug. 1983).
A detailed description of the methodology for obtaining the shear viscosity of model liquids by nonequilibrium molecular dynamics computer simulation is made. This includes the choice of the algorithm for integrating the translational equations of motion. The method of virtual trajectories for obtaining the linear ('zero shear rate') shear viscosity is outlined. There is good agreement with recent measurements of the experimental shear viscosity of argon and the corresponding Lennard-Jones equivalent fluid, at high density and temperature. This data is combined with the self-diffusion coefficients via the Stokes-Einstein relationship and it suggests an increasing effective flow unit diameter with decreasing density. Insights into the detailed microscopic origins for this are provided by velocity and force autocorrelation functions, radial distribution and fluctuation functions, and structure factors. The use of fluctuation expressions for the shear moduli and viscosities compare unfavourably in statistical accuracy with those furnished by nonequilibrium molecular dynamics. (34 refs.)

102031 The viscidity of amorphous dysprosium-impure selenium. E.G.Akhundova.
Izv. Akad. Nauk Az. SSR Ser. Fiz.-Tekh. & Mat. Nauk (USSR), no.6, p.94-6 (1982). In Russian.
The viscidity of amorphous dysprosium-impure (0.05, 0.10, 0.50 weight per cent) selenium at 40, 45, 50, 61°C was investigated. The minimum values of the concentration dependence curves are obtained, which are supposedly assigned to the chain termination of selenium. (6 refs.)

102032 Kinematic viscosity of As_xSe_{1-x} glass forming liquids. A.Kadoun, G.Chaussemy, J.Fornazero (Lab. des Semiconducteurs non Critallins, Univ. Claude Bernard, Lyon I, Villeurbanne, France), J.M.Mackowski.
J. Non-Cryst. Solids (Netherlands), vol.57, no.1, p.101-8 (Aug. 1983).
The kinematic viscosity behaviour of As_xSe_{1-x} molten chalcogenides is relatively well described by an Arrhenius equation, $\nu=\nu_0\exp(W/k,T)$, for x betweeen 0 and 0.8. The $\nu(x)$ and $W(x)$ evolutions suggest that these liquids represent a polymeric structure even outside the easy glass forming region. The tendency of atoms to form separate molecules, previously observed in the As-S system, remains small and only cuses a slight inflexion in the $\nu(x)$ and $W(x)$ isotherm curves near $x=0.5$. (14 refs.)

102033 Temperature dependence of melt viscosity of polymers. V.E.Dobrescu, C.Radovici (Res. Inst. for Chem., ICECHIM, Bucharest, Rumania).
Polym. Bull. (Germany), vol.10, no.3-4, p.134-40 (July 1983).
The temperature dependence of steady-state melt viscosity of several polymers-semicrystalline and amorphous—in a broad temperature range has been studied. In many cases this dependence can not be expressed by an Arrhenius type equation. Breaks and slope changes have been observed. The influence of polymer morphology and molecular weight and the influence of pressure are presented. (11 refs.)

102034 Aspects of dispersion and flow in thermoplastic-elastomer blends. H.P.Schreiber, A.Olguin (Dept. of Chem. Engng., Ecole Polytech., Montreal, Quebec, Canada).
Polym. Eng. & Sci. (USA), vol.23, no.3, p.129-34 (Feb. 1983). [received: July 1983]
Polypropylene, polystyrene, EP (ethylene/propylene) rubber, and bromobutyl rubber were blended under standardized conditions and the sizes of minor phase domains determined by Quantimet analysis. Dispersion effectiveness

was found to depend on the melt viscosities of components under mixing conditions and on their 'compatibility' as inferred from surface-tension data. Dispersion was optimized when components wet readily at contact surfaces and when melt viscosities were similar. Shear heating during dispersion appeared to offer an empirical index of component compatibility. Apparent melt viscosities of the blends further reflected the component compatibility factor. (15 refs.)

102035 Flow birefringence and viscosity of chitozane solutions in acetic acid at various ionic power. S.Ya.Lyubina, I.A.Strelina, L.A.Nud'ga, Ye.A.Plisko, I.N.Bogatova.
Vysokomol. Soedin. Ser. A (USSR), vol.25, no.7, p.1467-72 (July 1983). In Russian. English translation in: *Polym. Sci. USSR (GB)*
The solutions of chitozane samples with MM ranging from 1×10^4 to 5×10^5 have been studied by viscometry and flow birefringence methods with variation of ionic power I of the solution. In isoionic solutions the linear dependence of reduced viscosity on the concentration of chitozane is observed in the 100-fold range of I values. The intrinsic viscosity is a linear function of $I^{-0.5}$. Unfolding of molecular chain during polyelectrolyte swelling results in 2-3-fold increase of optical anisotropy of the segment related with increasing of the length of the Kuhn segment. In the solutions under study chitozane macromolecules have the conformation of the swelled coil with dimensions and rigidity dependent on the I value. (15 refs.)

102036 Diffusion of liquids into resins and composites. J.M.Marshall (Manchester Polytech., Manchester, England), G.P.Marshall, R.F.Pinzelli.
Chemtech (USA), vol.13, no.7, p.426-32 (July 1983).
How well plastics keep things in or out is vitally important in packaging. Life expectancy of polymers depends on the environment in which they are used. Consequently, it is important to be able to predict how materials move through plastics. The authors have developed a technique that uses radiolabeled diffusants to study the diffusion of liquids into thick sections of polymer and glass-fiber-reinforced laminates. This technique allows construction of concentration profiles of diffusants in the polymer at any time and calculation of diffusion coefficients from short-term data. (13 refs.)

102037 Interstitial diffusion in the presence of substitutional traps. D.Farkas (Dept. of Materials Engng., Virginia Polytech. Inst. & State Univ., Blacksburg, VA, USA).
Scr. Metall. (USA), vol.17, no.7, p.837-9 (July 1983).
Due to the technological interest of the diffusion process of interstitial species (H, C, N) in substitutional solutions several models have been developed. The assumptions underlying the different models are analysed. (13 refs.)

102038 Electronic model of fianites. V.V.Osiko, A.L.Shimkevich, B.A.Shmatko (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Sov. Phys.-Dokl. (USA), vol.27, no.11, p.939-41 (Nov. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.1-3, p.351-4 (Nov. 1982).
Develops the theory of solid electrolytes with oxygen-ionic conductivity by describing their properties within the framework of the band theory of solids. It follows from the electron model of fianites that the EMF of an open galvanic circuit, first, is determined by the difference of Fermi levels at the boundaries of the oxide electrolyte and, secondly, is limited by the ratio of the band-gap width to the electronic charge. Since the Fermi level is in a linear relation with the work function χ_e, having experimentally determined the parameters ϵ_g, χ_e, and η_e the authors can establish the position of the Fermi level ε_F in the band-gap of the electrolyte and predict the change in the electron-hole conductivity of fianites when the thermodynamic properties of the environment change. 66.30F Self-diffusion in metals, semimetals, and alloys

102039 Diffusion of chromium and silicon in nickel solid-solution alloys of the Ni-Cr-Si system. G.R.Johnston (Defence Sci. & Technol. Organization, Dept. of Defence, Maribyrnong, Victoria, Australia).
High Temp.-High Pressures (GB), vol.14, no.6, p.695-707 (1982). [received: June 1983] (International Conference on Chemistry of Materials at High Temperatures, Harwell, Oxon., England, 7-10 Sept. 1981).
The diffusion of chromium and silicon in nickel-rich Ni-Cr-Si solid-solution alloys has been studied using both binary ($1323K \leq T \leq 1523K$) and ternary (1523K) diffusion-couple experiments. A new method has been used to represent diffusion in ternary alloys. 'Pseudo-binary' coefficients, Φ_{Cr} and Φ_{Si}, determined solely from the concentration profiles of the respective solutes, are plotted on three-dimensional diagrams to provide graphic illustrations of the concentration dependences of diffusion rates in ternary alloys. The two binary (D_{Cr} and D_{Si}) and the four ternary (D_{CrCr}, D_{SiSi}, D_{CrSi}, and D_{SiCr}) coefficients are generally consistent with predictions from existing diffusion models. Silicon was found to have a strong influence on its own diffusion rate, as well as on the diffusion rate of chromium. The significance of this work to the development of nickel-based alloys and coatings that are resistant to high-temperature corrosion is discussed. (35 refs.)

102040 One-dimensional-particle kinetics in a multicomponent alloy. The asymptotic time dependence of the mean-square displacement. R.A.Tahir-Kheli (Dept. of Phys., Temple Univ., Philadelphia, PA, USA).
Phys. Rev. B (USA), vol.28, no.4, p.2257-60 (15 Aug. 1983).
The mean-square displacement, $\langle r^2(t)\rangle$, of a labeled particle hopping on a linear chain through a multicomponent dynamic background with vacancy concentration v is evaluated in the limit of extremely long times. The author finds $\langle r^2(t)\rangle = [2va^2/(1-v)^{1/2}](Jt/\pi)^{1/2}$, where J is a collective hopping rate given by $(\Sigma_\lambda x^\lambda/J^\lambda)^{-1}$. Here J^λ is the hopping rate and x^λ the concentration of the λth atomic species in the background. (22 refs.)

102041 Volume and intergranular self-diffusion of ^{59}Fe in CFC iron sulphur alloys. D.Treheux (Lab. Metall. Phys.-Materiaux, Ecole Centrale de Lyon, Ecully, France).
Scr. Metall. (USA), vol.17, no.7, p.933-6 (July 1983). In French.
The presence of sulphur gave rise to a diminution of the diffusion coefficients of the iron and to an important segregation of the sulphur in intergranular diffusion. Expressed in weight percent the alloys contained between 10.5×10^{-4} and $120\times10^{-4}\%$ of sulphur and between 8×10^{-4} and $10\times10^{-4}\%$ of carbon. For autodiffusion throughout the volume of the iron the Arrhenius equation was obeyed for the iron in the FCC FeS alloys. For the apparent intergranular self-diffusion of the iron in FeS alloys $10.5\times10^{-4}\%$ of sulphur had practically no effect, whereas lower diffusion coefficients were obtained with the higher sulphur concentrations. There was some indication that the types of segregation, pre-precipitation and precipitation of sulphur, are probably different at the grain boundaries of CC iron from those at the grain boundaries of FCC. 66.30H Self-diffusion and ionic conduction in nonmetals

102042 Influence of oxygen partial pressure on the electrical conductivity of binary oxides CeO_2-HfO_2. E.Debray, P.Malou, B.Chappey (Univ. Paris-Val-de-Marie, Creteil, France).
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.16, p.1239-41 (2 May 1983). In French.
The electrical conductivities of binary oxide CeO_2-HfO_2 containing 0,4,8,12,16, or 20 moles per cent of HfO_2, are measured at 1000-1400°C. They vary as the -1/n power of oxygen partial pressure, between 1 and 10^{-5} atm. Nevertheless, the coefficient, n, depends at the same time, on temperature and composition. The results for high contents of HfO_2, are consistent with formation of doubly ionized anionic vacancies at the time of reduction, but they are not generalizable for pure CeO_2 or low contents of HfO_2. (4 refs.)

102043 Ionic conduction of sulphide-based glasses in the systems M_2S-GeS_2-MI (M=Li,Ag). B.Carette (Lab. de Chimie des Materiaux, Univ. des Sci. et Tech. du Languedoc, Montpellier, France).
Glass Technol. (GB), vol.24, no.3, p.157-60 (June 1983). (Symposium on Halide and other Nonoxide Glasses, Cambridge, England, 23-26 March 1982).
GeS_2 forms stable glasses with M_2S and MI (M=Li, Ag) over a large range of compositions: $1\text{-}z(xM_2S\text{-}(1\text{-}x)GeS_2)\text{-}zMI$ with $0<x<0.5$ and $0<z<0.5$. Measurements of glass transition temperature and Raman investigations show that the iodide anions remain outside the macromolecular chains. The electrical conductivity of these glasses has been measured from −40 to +100°C by the complex impedance method. The conductivity reaches a maximum value of 1.2×10^{-4} $(\Omega\ cm)^{-1}$ for lithium glasses and 6×10^{-3} $(\Omega\ cm)^{-1}$ for silver glasses at ambient temperature. The ionic transference number was found to be 1, showing that these materials are pure ionic conductors. (14 refs.)

102044 Electrical switching effects in Na_2O/SiO_2 glasses. E.E.Khawaja, M.N.Khan (Phys. Dept., Univ. of Petroleum & Minerals, Dhahran, Saudi Arabia), C.A.Hogarth.
Int. J. Electron. (GB), vol.55, no.2, p.303-5 (Aug. 1983).
A range of specimens in the form of thin blown films is shown to exhibit memory switching at an applied voltage of 8-10 V. (5 refs.)

102045 The migration energy of point defects in $Cd_{0.2}Hg_{0.8}Te$. A.V.Ghorshkov, F.A.Zaitov, F.K.Isaev, G.M.Shalyapina.
Izv. Akad. Nauk Az. SSR Ser. Fiz.-Tekh. & Mat. Nauk (USSR), no.5, p.91-3 (1982). In Russian.
The measurement of the activation energy for Hg selfdiffusion in $Cd_{0.2}Hg_{0.8}Te$ by interknot and vacancy mechanisms is shown. On the base of obtained data the approximate values of the migration energy for single and double charged interknot atoms and vacancies of Hg are given. (6 refs.)

102046 Field-assisted thermally stimulated current of mobile ions in a dielectric layer of a metal-oxide-semiconductor structure. T.Changhua, H.Mingzhen, W.Yangyuan (Dept. of Computer Sci. & Technol., Peking Univ., Peking, China).
J. Appl. Phys. (USA), vol.54, no.8, p.4398-404 (Aug. 1983).
A field-assisted thermally stimulated ionic current method has been used to investigate the transient currents associated with mobile ions in dielectric layers of metal-oxide-semiconductor (MOS) structures. Assuming Poole-Frenkel effect, an interface trapping model has been used to analyze *J-V* curves. Using a ramp voltage, analytic expressions for normalized *J-V* curves are obtained. The single energy model and distributed energy model have been analyzed. The most probable trapping depth of mobile ions, attempt-

to-escape frequency and trapping energy distribution of mobile ions may be determined from *J-V* curves. The experimental results are consistent with theoretical calculations. (9 refs.)

102047 **^{55}Fe diffusion in magnetite crystals at 500°C and its relevance to oxidation of iron.** A.Atkinson, M.L.O'Dwyer, R.I.Taylor (Materials Dev. Div., AERE Harwell, Didcot, England).
J. Mater. Sci. (GB), vol.18, no.8, p.2371-9 (Aug. 1983).
A computer-controlled sputter-sectioning apparatus is described which is particularly useful for self diffusion studies at 'low' temperatures (D in the range 10^{-12} to 10^{-19} cm^2 sec^{-1}). The technique has been applied to measure the diffusion coefficient of ^{55}Fe in the magnetite lattice as a function of oxygen activity at 500°C. The results are in broad agreement with an extrapolation of pre-existing high temperature diffusion data ($T>900$°C). The low temperature data have been used to estimate the rate constant for magnetite formation on iron in CO_2+1 vol.% CO at 500°C and this is found to be 250 times smaller than the experimentally measured value. This disagreement is probably attributable to diffusion along oxide grain boundaries during oxidation. The rate constant for the formation of magnetite during the oxidation of iron in oxygen has also been calculated from the diffusion data and is compared with the measured rate constant for temperatures between 325 and 1100°C. (20 refs.)

102048 **Ionic conductivity of Li_4SiO_4 solid solutions in the system Li_2O-Al_2O_3-SiO_2.** K.Jackowska, A.R.West (Dept. of Chem., Univ. of Aberdeen, Aberdeen, Scotland).
J. Mater. Sci. (GB), vol.18, no.8, p.2380-4 (Aug. 1983).
In the system Li_2O-Al_2O_3-SiO_2, Li_4SiO_4 forms two limited ranges of solid solutions: $Li_{4+x}Si_{1-x}Al_xO_4$: $O<x\lesssim0.4$, containing interstitial Li^+ ions and $Li_{4-3y}Al_ySiO_4$: $0\leq y\lesssim0.06$, containing Li^+ vacancies. The AC conductivity of polycrystalline samples of several compositions was measured over a range of frequency (2×10^2 to 5×10^4 Hz) and temperature (25 to 500°C). Both solid solutions, especially the Li^+ interstitial ones, have markedly higher conductivity than has stoichiometric Li_4SiO_4. This is due to an increase in the number of mobile ions and a decrease in the activation energy for conduction in the solid solutions. (19 refs.)

102049 **Electrical conductivity of the Li_2SO_4-Li_2CO_3 system.** V.K.Deshpande, K.Singh (Dept. of Phys., Nagpur Univ., Nagpur, India).
J. Power Sources (Switzerland), vol.10, no.2, p.191-5 (July 1983).
With a view to improving the electrical conductivity of Li_2SO_4 at the lowest possible temperature, Li_2CO_3 was added in the ratios of 10-90 mol.% and its conductivity was measured. The system LI_2SO_4-Li_2CO_3 has its eutectic at a composition of 60:40 mol.%; this composition has the maximum conductivity of the series, 2.43×10^{-3} (ohm cm)$^{-1}$ at 723K. The high conductivity may be due to the quasiliquid state of the mobile species within the sublattice. Further, the addition of 5 mol.% of LiCl to the eutectic gave rise to an increase in the conductivity, 1.13×10^{-3} (ohm cm)$^{-1}$ at 553K. This may be suitable as an electrolyte for application to power sources. (15 refs.)

102050 **Charge transport in $Sr_{1-x}La_xF_{2+x}$ solid solutions. An ionic thermocurrent study.** J.Meuldijk, H.W.Den Hartog (Solid State Phys. Lab., Univ. of Groningen, Groningen, Netherlands).
Phys. Rev. B (USA), vol.28, no.2, p.1036-47 (15 July 1983).
A comprehensive study of the relaxation of space charges in solid solutions of the type $Sr_{1-x}La_xF_{2+x}$ will be reported. In this investigation the authors have employed the ionic thermocurrent technique. LaF_3 concentrations between 0.01 and 42 mol.% have been used. They have paid attention to the resemblance between space-charge relaxation and ionic conductivity in heavily rare-earth-doped fluorite-type solid solutions. They will show that the enhancement of the conductivity and the shift of the space-charge relaxation band to lower temperatures with increasing rare-earth concentration can be explained with the same mechanism. Charge transport is supported by two kinds of interstitial jumps: free interstitial jumps occurring relatively far from a rare-earth ion and energetically more favorable dipolelike jumps of interstitial fluoride ions in the neighborhood of a rare-earth ion. They will also discuss the influence of the defect concentration on the degree of dissociation of the dipoles present and the effect of the concentration on the defect structure of the $Sr_{1-x}La_xF_{2+x}$ solid solutions. It will be made clear that the charge transport in rare-earth-doped fluorite-type ionic crystals is supported by a percolation mechanism. (47 refs.)

102051 **Superionic conduction in the solid-solution electrode $AgCrS_2$.** N.L.Sharma (Dept. of Phys. & Astron., Univ. of Georgia, Athens, GA, USA), T.Tanaka.
Phys. Rev. B (USA), vol.28, no.4, p.2146-51 (15 Aug. 1983).
The ionic conductivity of a mixed electron and ion conductor $AgCrS_2$ which undergoes an order-disorder phase transition is investigated with the use of a lattice-gas Hamiltonian with a weak-hopping term for its interacting-ion system. Exact results for the ionic conductivity obtained by making use of the exact Ising spin correlations on a half-filled honeycomb lattice agree very well with the known experimental results. (19 refs.)

102052 **Relations between crystal structures and ionic conductivity.** H.Schulz (Max-Planck-Inst. fur Festkorperforschung, Stuttgart, Germany).
Physics of Superionic Conductors and Electrode Materials. Proceedings of a NATO Advanced Study Institute on the Physics of Superionics Conductors and Electrode Materials, Odense, Denmark, 4-22 Aug. 1980 (New York, USA: Plenum Press 1983), p.5-26
High ionic conductivity combined with very low electronic conductivity has been observed in several crystals. Crystal structure analysis and the interpretation of diffuse X-ray scattering have been successfully applied in the investigation of the ionic conduction mechanism in such crystals. Ions may move easily and rapidly in crystals if their ionic radius fits into the cross sections of the conducting paths and if these paths connect regular lattice sites. The crystal field potential shows a rather weak variation along these diffusion paths. The regular lattice sites form local but shallow potential minima in such paths. These sites are not allowed to be completely occupied. The amount of underoccupancy ranges from about 1% to more than 50%. (28 refs.)

102053 **Thermodynamic and transport properties of superionic conductors and electrode materials.** J.H.Harding (Theoretical Phys. Div., AERE Harwell, Didcot, England).
Physics of Superionic Conductors and Electrode Materials. Proceedings of a NATO Advanced Study Institute on the Physics of Superionics Conductors and Electrode Materials, Odense, Denmark, 4-22 Aug. 1980 (New York, USA: Plenum Press 1983), p.27-40
The authors have considered the hopping model as a possible description of superionic conductors. It is clear that it is an idealisation; in many cases it may be adequate to consider groups of associated defects as a method of correcting for high defect concentrations but beyond this it seems necessary to move into some lattice gas type of model. The advantage, however, of the hopping model is that all the parameters it requires are calculable or can, in the case of the defect concentration, be estimated from experiment. This gives it a considerable advantage over the parameterised thermodynamic models in that one has a much clearer ability to test the assumptions built into the calculation against experiments. (20 refs.)

102054 **Molecular dynamics studies of superionic conductors.** A.Rahman, P.Vashishta (Argonne Nat. Lab., Argonne, IL, USA).
Physics of Superionic Conductors and Electrode Materials. Proceedings of a NATO Advanced Study Institute on the Physics of Superionics Conductors and Electrode Materials, Odense, Denmark, 4-22 Aug. 1980 (New York, USA: Plenum Press 1983), p.93-142
Structural and dynamical properties of superionic conductors AgI and CuI are studied using molecular dynamics (MD) techniques. The model of these superionic conductors is based on the use of effective pair potentials. To determine the constants in these potentials, cohesive energy and bulk modulus are used as input; in addition one uses notions of ionic size based on the known crystal structure. Salient features of the MD technique are outlined. Methods of treating long range Coulomb forces are discussed in detail. This includes the manner of doing Ewald sum for MD cells of arbitrary shape. Features which can be incorporated to expedite the MD calculations are also discussed. (68 refs.)

102055 **Monte Carlo study of solid electrolytes.** Y.Hiwatari (Dept. of Phys., Faculty of Sci., Kanazawa Univ., Kanazawa, Japan), A.Ueda.
Physics of Superionic Conductors and Electrode Materials. Proceedings of a NATO Advanced Study Institute on the Physics of Superionics Conductors and Electrode Materials, Odense, Denmark, 4-22 Aug. 1980 (New York, USA: Plenum Press 1983), p.211-19
A simple version of the soft-core model for simple liquids for superionic conductors is proposed. That is, the model potential is composed of only the soft-core and Coulomb potentials, Monte Carlo simulations for two solid electrolytes, α-AgI and CaF_2, are made using a fine-grained lattice for a 108-ion system and 324- or 96-ion systems, respectively, at several temperatures. For both systems the authors have observed sublattice disordering over an appropriate temperature range. They have obtained the partial pair distribution functions, one body distribution of ions and mean square displacement of ions as a function of the Monte Carlo time-step. Their results compare satisfactorily with experiments and molecular dynamics calculations. It is found for CaF_2 that as the temperature increases the fraction of anions in the tetrahedral locations shows a drop in magnitude over a narrow temperature range, and that results obtained for the fluctuations of potential energies in the superionic phase have a rather large system-size-dependency. (18 refs.)

102056 **Application of irreversible thermodynamics to mass transport in ionic conductors.** F.H.Horne (Dept. of Chem., Michigan State Univ., East Lansing, MI, USA).
Physics of Superionic Conductors and Electrode Materials. Proceedings of a NATO Advanced Study Institute on the Physics of Superionics Conductors and Electrode Materials, Odense, Denmark, 4-22 Aug. 1980 (New York, USA: Plenum Press 1983), p.257-71
Despite the almost universal acceptance of the non-equilibrium, or irreversible, thermodynamics (NET) of Onsager, most of the published research concerning ion transport relies on the Nernst-Planck equations. The Nernst-Planck equations ignore cross-effects due to both equilibrium and non-equilibrium interactions. However, cross-effects cannot be ignored in complete treatments of ion transport. In this paper, transport properties of binary electrolyte solutions are discussed. This discussion leads to explicit statements about the range of validity of the Nernst-Planck equations and of other approximations. Some analytical and numerical approaches to solving the isothermal transport equations for various boundary conditions are also considered; and the extension of the transport equations to nonisothermal systems is presented. (19 refs.)

102057 **Ion transport boundary conditions.** F.H.Horne, J.H.Leckey (Dept. of Chem., Michigan State Univ., East Lansing, MI, USA), J.W.Perram.
Physics of Superionic Conductors and Electrode Materials. Proceedings of a NATO Advanced Study Institute on the Physics of Superionics Conductors and Electrode Materials, Odense, Denmark, 4-22 Aug. 1980 (New York, USA: Plenum Press 1983), p.273-7
In theoretical studies of ion transport in heterogeneous systems it is convenient to employ kinetic boundary conditions of the form $j_i=k_{if}c_{i0}-k_{ib}c_{i\delta}$, for the flux j_i of ion i through an interface of thickness δ. The forward and reverse rate constants are k_{if} and k_{ib}, and c_i is the ion concentration. The purpose of this article is to determine the assumptions required for validity of boundary conditions of this type. (4 refs.)

102058 Analysis of moisture gradients in service and in the laboratory. E.C.Edge (Warton Div., British Aerospace plc, Preston, England).
Composites (GB), vol.14, no.3, p.189-95 (July 1983). (Symposium on Environmental Effects on Fibre-Reinforced Plastics, London, England, 12-13 July 1983).
Theoretical equations are presented for the direct calculation of moisture gradients. Using the given model, the effect and importance of the input frequency is shown. Spot values of the moisture gradient are calculated under typical conditioning regimes and under service conditions. The analysis appears to have potential, allowing choice of optimum laboratory methods to accelerate moisture uptake and the determination of typical moisture profiles. However, the work lacks experimental verification, which, for the larger, more transient moisture gradients, is beyond current measuring techniques. (8 refs.)

102059 Diffusion of small molecules in polymers. H.L.Frisch (Dept. of Chem., State Univ. of New York, Albany, NY, USA), S.A.Stern.
CRC Crit. Rev. Solid State & Mater. Sci. (USA), vol.11, no.2, p.123-187 (1983).
Reviews and discusses the phenomenology, theories, and methods of measurement of diffusion of small molecules in polymers. Both rubbery and glass penetrant-polymer systems are considered. The literature is surveyed through Spring 1980. (193 refs.)

102060 Oxygen transport through silica surface layers on silicon-containing ceramic materials. J.Schlichting (Inst. for Chem. Tech., Univ. Karlsruhe, Karlsruhe, Germany).
High Temp.-High Pressures (GB), vol.14, no.6, p.717-24 (1982). [received: June 1983] (International Conference on Chemistry of Materials at High Temperatures, Harwell, Oxon., England, 7-10 Sept. 1981).
The oxidation behaviour of the silicon ceramics ($MoSi_2$, SiC, Si_3N_4, SiAlON) as well as elemental silicon is controlled by the permeation of molecular oxygen through the SiO_2 surface layer. The correlation of the transport mechanism with the oxidation velocity is discussed in detail. Furthermore, it can be shown that the oxygen transport is dependent on the structure of the glassy or partly crystallized SiO_2 surface layer as well as its chemical composition. It is possible to decrease this oxygen transport by crystallization phenomena caused by additions of aluminium or titanium in the ceramics or to increase it by modifying the SiO_2 glass with Na_2O, MgO, or Y_2O_3. In addition to this the oxygen velocity is increased by atmospheric moisture which increases the oxygen transport in the SiO_2 surface layer. (42 refs.)

102061 Two-dimensional numerical analysis of impurity atom diffusion in semiconductors. A.Buonomo (Electrical Dept., Univ. of Calabria, Cosenza, Italy), C.di Bello.
IEEE Trans. Electron Devices (USA), vol.ED-30, no.7, p.857-60 (July 1983).
Linear two-dimensional diffusion of impurity atom through finite-dimension masks has been numerically examined. Numerical simulation results demonstrate the limits of the two-dimensional analytical diffusion model which was first employed in the well-known paper by Kennedy and O'Brien (1965). (10 refs.)

102062 Double-flow mechanism of In and Ag migration in $Cd_xHg_{1-x}Te$. A.V.Gorshkov, F.A.Zaitov, F.K.Isaev, G.M.Shalyapina.
Izv. Akad. Nauk Az. SSR Ser. Fiz.-Tekh. & Mat. Nauk (USSR), no.6, p.97-9 (1982). In Russian.
By the method of noted atoms the diffusion of indium and argentum in monocrystalline samples $Cd_{0.2}Hg_{0.8}Te$ has been investigated. It was established that in this case the diffusional process has low and fast components. The dependencies of coefficients of low and fast diffusion for indium and argentum on temperature are defined in the interval of 300-450°C. It was shown, that the fast component appearing was not related with the migration of diffusion along the accelerated path. (5 refs.)

102063 Diffusion of boron into polycrystalline silicon from a single crystal source. W.A.Rausch, R.F.Lever, R.H.Kastl (IBM General Technol. Div., Hopewell Junction, NY, USA).
J. Appl. Phys. (USA), vol.54, no.8, p.4405-7 (Aug. 1983).
Boron was outdiffused at 900°C from single crystal silicon into undoped chemical vapor deposited polycrystalline silicon. Boron concentration profiles measured by secondary ion mass spectrometry showed preferential segregation into the polysilicon with a segregation coefficient of 0.7. Pileup of boron at grain boundaries due to migration of boron ions in the interface field during the diffusion process can account for some of the observed segregation. (20 refs.)

102064 Concentration dependence of diffusion in liquid crystals. A new experimental approach. H.Hakemi (Dept. of Chem., Univ. of Sci. & Technol., Tehran, Iran).
J. Chem. Phys. (USA), vol.79, no.3, p.1434-8 (1 Aug. 1983).
The impurity diffusion of a chiral species into an aligned nematic film displays a unique textural behavior. A dynamical analysis of this type of texture provides a new approach to study the concentration dependence of the diffusion coefficients in liquid crystals. By a simple variable rearrangement in the solution to the Fick's Law, the authors evaluated the diffusion coefficients from the linear portion of the typical x_k^2/t-ln t plot at various measurable concentrations (pitches). The results showed an inverse law between the diffusion coefficient and the concentration of the diffusion profile. Extrapolation to zero concentration would give a good approximation to the self-diffusion coefficient of the nematic solvent. (11 refs.)

102065 Multizone modeling of impurity redistribution in ion-implanted materials. R.Kwor, C.Paz de Araujo (Dept. of Electrical Engng., Univ. of Notre Dame, Notre Dame, IN, USA).
J. Electrochem. Soc. (USA), vol.130, no.7, p.1580-6 (July 1983).
Implanted impurity redistribution has been observed during annealing of many ion-implanted materials. Experimental evidence suggests some position dependence in the redistribution process. The tail region of ion-implanted impurity profiles usually exhibits faster diffusion than the near-surface region. A multizone model for the redistribution of implanted impurities is presented. The implanted substrate is considered as a stratified medium with zones where a local diffusion equation is obeyed, and an effective diffusion coefficient is defined within each zone. The basic formulation of the model and its mathematical background are discussed. The multizone equations are solved using the Crank-Nicolson method. A computer program is used to generate a plot of the post-annealing redistributed impurity profile. The model is applied to the case of sulfur-implanted GaAs for dose range of 4×10^{13} to 4×10^{15} cm^{-2}, with energies of 120 and 300 keV. Good agreement is obtained between the computer generated profile and the SIMS experimental profile. (16 refs.)

102066 Evidence of divacancies in the diffusion of In in GaSb. D.Shaw (Dept. of Phys., Univ. of Hull, Hull, England).
J. Phys. C (GB), vol.16, no.23, p.L839-42 (20 Aug. 1983).
The experimental results of Mathiot and Edelin (1980) for the diffusivity of In in GaSb are interpreted in terms of two parallel diffusion mechanisms involving the divacancies (V_{Ga}-V_{Sb}) and (V_{Ga}-V_{Ga}). This interpretation provides a better fit to the experimental data than the V_{Ga} diffusion mechanism proposed by D. Mathiot and G. Edelin (1980). (9 refs.)

102067 Diffusion of nitric acid in rigid polyvinyl chloride. H.Kawaguchi (Faculty of Engng., Fukui Univ., Fukui, Japan).
J. Soc. Mater. Sci. Jpn. (Japan), vol.32, no.356, p.482-5 (May 1983). In Japanese.
It has been known that the creep strength of polyvinyl chloride (PVC) in conc. nitric acid is remarkably lower than that in air. This behavior has been explained from the viewpoint of the plasticizing effect of nitric acid in PVC. However, the diffusion process of nitric acid in PVC has not yet been made clear. The diffusion of conc. nitric acid in rigid polyvinyl chloride was studied experimentally by using the film-adhesion method which is similar to the film-roll method. The tests were carried out under unloaded and loaded conditions at temperatures 25 to 55°C. Under the unloaded condition, the diffusion process is Fickian and the surface concentration of nitric acid in PVC does not change with immersion time. The diffusion coefficients of nitric acid are in the range of 10^{-12}-10^{-11} cm^2/sec. In the case of tensile stress levels less than 75 kg/cm^2, the diffusion process is almost the same as that in the case of the unloaded condition at 40°C. At a stress level of 95 kg/cm^2, the diffusion process is non-Fickian where the surface concentration increases with immersion time. (7 refs.)

102068 Effect of cold working on the hydrogen trapping phenomena in pure iron. W.Y.Choo (Korea Advanced Inst. of Sci. & Technol., Seoul, Korea), Jai Young Lee.
Metall. Trans. A (USA), vol.14A, no.7, p.1299-305 (July 1983).
Hydrogen trapping in iron with various types and amounts of trapping sites was investigated through permeation experiments. The apparent hydrogen diffusivity decreases as the degree of cold working increases. This decrease is attributed to an increase in dislocation density and microvoid concentration. Analysis of the permeation data suggests that hydrogen binding energies of dislocation and microvoid are 25.6 kJ/mole and 29.1 kJ/mole, respectively. The data further show that the apparent hydrogen diffusivity increases as applied hydrogen pressure increases. Energy level diagrams around various trapping sites are proposed. (30 refs.)

102069 Deuterium transport and trapping in aluminum alloys. A.K.Zurek (Materials Phys., Rockwell Internat. Sci. Center, Thousand Oaks, CA, USA), R.Walser, H.L.Marcus.
Metall. Trans. A (USA), vol.14A, no.7, p.1307-12 (July 1983).
A simple model of diffusion and evolution of the density of deuterium in metals is presented. A model of the deuterium evolution in the presence of uniform and nonuniform distributions of traps, as well as perfectly reflecting and partially permeable boundary conditions, is discussed. The computer simulated deuterium distributions after some diffusion time are qualitatively compared with experimentally obtained results. Experimental results describe the deuterium distribution after fatigue crack growth of 2219 and 7075 aluminum alloys in a D_2O water vapor environment and after deuterium ion implantation. (24 refs.)

102070 Modeling of transport of small molecules in polymer blends: application of effective medium theory. J.Sax, J.M.Ottino (Dept. of Chem. Engng., Univ. of Massachusetts, Amherst, MA, USA).
Polym. Eng. & Sci. (USA), vol.23, no.3, p.165-75 (Feb. 1983). [received: July 1983]
The authors are concerned with the prediction of effective diffusion coefficients of small permeants in binary polymer blends of varying degrees of miscibility and microstructural order. Several models have been critically evaluated with the help of previously published experimental data and in terms of consistency of morphological information provided by small permeants serving as morphological probes. Completely random, two-phase media have been modeled in terms of effective medium theory with the coordination number (z) describing the average morphology. A comprehensive analysis of experimental data has shown a correlation between z and various physical situations. Near the percolation threshold, z attains a maximum value while, above it, z tends to decrease with increasing content of the conductive component. Accurate predictions of effective diffusivity can be made for volume fractions between 0.3 and 0.8 by letting $z=6$. Evidence for phase inversion was studied in terms of models with ordered microstructure and transport data. (25 refs.)

102071 Direct observation of boron diffusion using secondary ion mass spectrometry for SiC-coated molybdenum with a boron underlayer. M.Kitajima, M.Fukutomi, M.Okada (Tsukuba Lab., Nat. Res. Inst. for Metals, Ibaraki, Japan).
Thin Solid Films (Switzerland), vol.105, no.4, p.325-30 (29 July 1983).
SiC-coated molybdenum with a boron underlayer (about 1 μm thick) was microanalysed by secondary ion mass spectrometry (SIMS). The coated specimens were cycled 2100 times between 800 and 1000°C and then 560 times between 600 and 1200°C in air under thermocyclic conditions. It was found from the SIMS analyses that the SiC film was boron enriched and also that boron diffused into the molybdenum substrate. The boron underlayer appeared to cause an improvement in the mechanical properties of the SiC film and the molybdenum substrate, and consequently SiC-coated molybdenum with a boron underlayer exhibits high temperature stability in air. (11 refs.)

102072 Diffusion and permeation of vapors in composite polymer thin films. S.A.Jenekhe, J.W.Lin (Corporate Phys. Sci. Center, Honeywell Corporate Technol. Center, Bloomington, MN, USA).
Thin Solid Films (Switzerland), vol.105, no.4, p.331-42 (29 July 1983).
The moisture barrier properties of polyimide (PI) thin films used for passivation in microelectronic devices are poorer than those of many other polymers. The enhancement of the barrier properties of PI films obtainable by coating them with polymers of lower permeability to form multilayer composite membranes was investigated. The authors report a study of the diffusion and permeation of water vapor in four composite PI/polymer thin films: PI/polyethylene, PI/polyethylene-acrylic acid, PI/poly(chloro-*p*-xylylene). The temperature-dependent permeability coefficient of single-layer and composite thin films was measured and found to follow the Arrhenius relation with low activation energies (lower than 6 kcal mol^{-1}). Enhancement in the barrier properties by a factor of 4-6 at 30°C is attained when 2-3 μm PI films are coated with 2 μm films of the four polymers investigated. (18 refs.)

102073 Impurity diffusion in silicon annealed by semi-continuous laser. J.-E.Bouree, C.Leray, M.Rodot (CNRS, Meudon, France).
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.221-7
The diffusion of an impurity into a solid which is irradiated by laser pulses of some milliseconds duration has been analysed in terms of effective diffusion time and temperature. In the case of Fe in Si, the diffusion coefficient is found to be similar to that measured by Collins and Carlson (1957), and independent of boron doping. In the case of Al in Si, a value of 2×10^{-10} cm^2/s at 1400°C has been found both for single crystals and for fine-grained polycrystals. (16 refs.)

102074 Atomic transport in dilute alloys containing interstitial defects. A.R.Allnatt (Dept. of Chem., Univ. of Western Ontario, London, Ontario, Canada), A.Barbu, A.D.Franklin, A.B.Lidiard.
Acta Metall. (USA), vol.31, no.9, p.1307-13 (Sept. 1983).
Presents the results of a reworking of a previous kinetic analysis of the fluxes of solute atoms and of interstitial defects arising from concentration gradients in a dilute alloy of FCC structure (A. Barbu, Acta Metall, vol.28, p.499, 1980). Revised expressions are presented for the various phenomenological coefficients introduced in that previous paper. Although these algebraic forms in terms of the various defect jump frequencies show differences from those given earlier, their numerical values under typical illustration conditions are little altered. At the same time, the corresponding expressions for the more fundamental phenomenological coefficients defined by the nonequilibrium thermodynamics are presented; they satisfy the Onsager reciprocal relationship. A consequential linear relationship among three of Barbu's phenomenological coefficients is also presented. (18 refs.)

102075 Interaction of Pb-Er alloys with silicon. G.Ottaviani, K.N.Tu, R.D.Thompson (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA), J.W.Mayer, S.S.Lau.
J. Appl. Phys. (USA), vol.54, no.8, p.4614-22 (Aug. 1983).
In situ resistivity measurements together with MeV $^4He^+$ backscattering, X-ray diffraction, barrier height measurements, and Auger electron spectroscopy combined with Ar sputtering have been used to investigate the interaction of silicon with alloys of rare-earth and near-noble metals with annealing at temperatures up to 650°C. Alloys of Pd-Er with three different compositions have been prepared by dual electron-gun coevaporation on both *n*- and *p*-type silicon with alloys of rare-earth and near-noble metals with annealing at temperatures up to 650°C. Alloys of Pd-Er with three different compositions have been prepared by dual electron-gun coevaporation on both *n*- and *p*-type silicon and Pd/Er bilayers have been deposited on SiO$_2$. The results show that as-deposited these alloys are amorphous and the initial stages of the reaction with silicon upon annealing is controlled by the metal-metal interaction as well as the metal-silicon interaction. The Er-rich alloy (Pd$_{15}$Er$_{85}$) segregates Er to the silicon interface and forms Pd$_2$Er$_5$. For the Pd-rich alloy (Pd$_{65}$Er$_{35}$) the excess Pd is segregated at the silicon surface forming Pd$_2$Si. The near 50-50 alloy forms PdEr and a slightly higher temperature is necessary to promote the reaction with silicon to form the silicide of the excess component. (20 refs.)

102076 Reduction of contact resistivity by As redistribution during Pd$_2$Si formation. I.Ohdomari, M.Hori, T.Maeda, A.Ogura, H.Kawarada, T.Hamamoto, K.Sano (School of Sci. & Engng., Waseda Univ., Tokyo, Japan), K.N.Tu, M.Wittmer, I.Kimura, K.Yoneda.
J. Appl. Phys. (USA), vol.54, no.8, p.4679-82 (Aug. 1983).
The authors have investigated the redistribution of uniformly doped As atoms ($N_D=4.0\times10^{19}$ cm^{-3}) in Si during Pd$_2$Si formation with neutron activation analysis and the influence of the redistribution on contact resistivity. Some of the uniformly doped As atoms are pushed ahead into Si near the silicide-silicon interface during Pd$_2$Si formation at 250°C. The amount of the redistributed As atoms increases with the thickness of Si consumed and reaches a peak concentration of 2.0×10^{20} cm^{-3}. Contact resistivity is reduced from the initial values of 3.8×10^{-5}-4.1×10^{-4} Ω cm^2 before silicide formation, to a final value of 1.8×10^{-6} Ω cm^2 after complete reaction. The electrically active As atoms is estimated to be 50% of the total redistributed. (12 refs.)

102077 Formation of an amorphous alloy by solid-state reaction of the pure polycrystalline metals. R.B.Schwarz, W.L.Johnson (W.M. Keck Lab., California Inst. of Technol., Pasadena, CA, USA).
Phys. Rev. Lett. (USA), vol.51, no.5, p.415-18 (1 Aug. 1983).
Single-phase Au$_{1-x}$La$_x$ alloys, with $0.3\lesssim x\lesssim0.5$, have been formed through solid-state interdiffusion of pure polycrystalline Au and La thin films (100-600 Å) at temperatures of 50-80°C. The reaction is driven by the large negative heat of mixing in the amorphous alloy and occurs at low temperature by the anomalously fast diffusion of Au in La. The composition regime giving a single-phase amorphous product is explained with use of a free-energy diagram. (12 refs.)

102078 The diffusion of salt solutions into nylon-6. R.P.Burford, E.Harrauer (School of Chem. Engng. & Industrial Chem., Univ. of New South Wales, Kensington, NSW, Australia).
Polymer (GB), vol.24, no.8, p.1001-7 (Aug. 1983).
The transport kinetics and concentration profiles of zinc chloride and lithium bromide into nylon-6 have been investigated. Polymers were soaked in solutions of a known concentration for varying lengths of time, and cross-sectional analysis of each sample was then carried out using the energy dispersive X-ray (EDA) technique, supplemented by microprobe (wavelength dispersion, WDA) and atomic absorption data. Broad agreement was obtained between EDA and WDA techniques when depth of penetration and concentration profiles were measured on the same samples, and estimates of salt concentrations in nylon were similar for both the WDA and atomic absorption methods. When the concentration of aqueous zinc chloride solution was increased, a transition from anomalous to Case II behaviour was observed. Lithium bromide transport was poorly defined by comparison, in keeping with a different mechanism of association to the polymer. (23 refs.)

102079 Solid state interaction between thin chromium films and silicon—a comparison between amorphous and single-crystal silicon. A.P.Botha, S.Kritzinger (Dept. of Phys., Univ. of Stellenbosch, Stellenbosch, S Africa), R.Pretorius.
Thin Solid Films (Switzerland), vol.105, no.3, p.237-49 (22 July 1983).
The interaction of a vacuum-deposited thin chromium film with both Si⟨100⟩ and amorphous silicon (a-Si) during heating was studied by means of electron microscopy, electron diffraction and Rutherford backscattering. Measurements on free polycrystalline chromium films alone revealed that the chromium grain size increases with the thickness of the chromium film, but that very little grain growth occurs when the temperature is increased. A phase change in the chromium crystal structure from simple cubic to BCC was detected around 550°C. During Cr-Si interaction, in cases where an unlimited supply of silicon is provided, CrSi$_2$ forms on both single-crystal silicon and a-Si at temperatures around 450°C, i.e. well below 550°C. However, when the silicon supply is limited, a metal-rich phase (Cr-Si$_3$) develops from the CrSi$_2$ and the excess chromium at 550°C. (22 refs.)

66.30Q Electromigration

102080 Electromigration in CeO$_{2-x}$. F.Millot, N.A.Younes, P.Gerdanian (Lab. des Composes Non-stoechiometriques, Univ. de Paris-Sud, Orsay, France).
High Temp.-High Pressures (GB), vol.14, no.6, p.725-8 (1982). [received: June 1983] (International Conference on Chemistry of Materials at High Temperatures, Harwell, Oxon., England, 7-10 Sept. 1981).
Discusses the values of the effective charge number Z^* obtained from experiments of electromigration in CeO$_{2-x}$. It is first shown that the electron wind force cannot contribute significantly to the redistribution of oxygen in CeO$_{2-x}$. The almost constant value of 2 obtained for Z^* in these experiments is interpreted in terms of a preferential diffusion of doubly ionized vacancies which are not necessarily the majority defect in CeO$_{2-x}$. (26 refs.)

66.70 NONELECTRONIC THERMAL CONDUCTION AND HEAT-PULSE PROPAGATION IN NONMETALLIC SOLIDS

(for thermal conduction in solid metals, see 72.15C and 72.15E; for statistical mechanics of lattice vibrations, see 63.70)

102081 Nonlinear nonclassical boundary problem for thermal conductivity of crystalline media. Yu.M.Kolyano, I.O.Goi.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.5, p.6-9 (1983). In Ukrainian.
A procedure is suggested for determining the nonstationary generalized temperature fields in crystalline bodies and thin plates whose thermal characteristics depend on temperature. The bodies considered are heated by radiation and internal heat sources. (7 refs.)

102082 Surface resistance dominated thermal transport in thin specimens. G.Dharmadurai (Reactor Phys. Section, Reactor Res. Centre, Tamil Nadu, India).
J. Appl. Phys. (USA), vol.54, no.8, p.4664-5 (Aug. 1983).
The effective thermal conductivity of a rarefied gas bounded by two solid surfaces is shown to be dominated by the two surface thermal resistances. Using an analogous picture, it is demonstrated that the thermal transport in a thin solid specimen under ballistic phonon propagation is as well dictated by the thermal boundary resistances of the relevant interfaces, resulting in an effective thermal conductivity proportional to the thickness of the specimen. The implications of the results are discussed. (11 refs.)

102083 Thermophysical properties of quartz glass. O.A.Sergeev, A.G.Shashkov, A.S.Umanskii (All-Union Sci.-Res. Inst. of Metrological Surface, Moscow, USSR).
J. Eng. Phys. (USA), vol.43, no.6, p.1375-83 (Dec. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.6, p.960-70 (Dec. 1982).
Available experimental data on the thermal conductivity, specific heat, and thermal diffusivity of quartz glass over the temperature range 60-1100K are generalized. Empirical equations describing the temperature dependence of these thermophysical parameters are presented. (40 refs.)

102084 Low-temperature lattice thermal conductivity of heavily deformed metallic alloys. F.L.Madarasz (Universal Energy Systems, Dayton, OH, USA), F.Szmulowicz.
Phys. Rev. B (USA), vol.28, no.4, p.1763-71 (15 Aug. 1983).
Lattice thermal conductivity in Cu-Al alloys is calculated for the first time within a two-dimensional formalism involving the scattering of phonons by strain fields of finite spatial extent around randomly oriented dislocations of edge and screw character. For the finite strain fields, scattering widths indicate that long-wavelength phonons scatter very weakly. In addition to phonon scattering by the strain field around the dislocation, phonon-electron scattering is included to obtain the overall phonon relaxation rate. Comparison is made between the calculated results and measurements on the commercial alloy Evanohm. Evanohm has a very high residual resistivity and thus possesses a low electronic thermal conductivity. Therefore, the phonon contribution to the thermal conductivity may be unambiguously identified for this alloy unlike the situation encountered for most other alloys at very low temperatures. The calculated lattice thermal conductivity is found to depart from the usual T^2 dependence in general agreement with the measurements on Evanohm. (29 refs.)

102085 Calculation of the thermal conductivity of glasses. Yu.V.Vavilov, V.E.Komarov, N.A.Tabunova.
Sov. J. Glass Phys. & Chem. (USA), vol.8, no.4, p.326-30 (July-Aug. 1982). Translation of: *Fiz. & Khim. Stekla (USSR)*, vol.8, no.4, p.472-7 (July-Aug. 1982). [received: May 1983]
By contrast with the usual methods of calculation of the thermal conductivity of glasses in relation to their chemical composition, the proposed method is based on contemporary theories of heat transport in solids and on taking into account the additional thermal resistivity which arises when phonons are scattered on the modifier atoms. This method can be recommended for calculating with an average error of 5% the thermal conductivity of newly synthesized glasses of any composition and also for analyzing the effect of individual components of the glass on its thermal conductivity. 67.00 QUANTUM FLUIDS AND SOLIDS; LIQUID AND SOLID HELIUM

(see also 05.30 Quantum statistical mechanics)

67.20 QUANTUM EFFECTS ON THE STRUCTURE AND DYNAMICS OF NONDEGENERATE FLUIDS

102086 Quantisation of flows of an ideal fluid. V.K.Tkachenko (Inst. of Solid-State Phys., Acad. of Sci., USSR).
Theor. & Math. Phys. (USA), vol.53, no.2, p.1150-1 (Nov. 1982). Translation of: *Teor. & Mat. Fiz. (USSR)*, vol.53, no.2, p.318-20 (Nov. 1982).
The possibility of solenoidal flow of an ideal quantum fluid without singularities is demonstrated. This is done by means of the formalism of diffeomorphism groups. (7 refs.)

67.40 BOSON DEGENERACY AND SUPERFLUIDITY OF HELIUM-4

102087 Friction on quantized vortices in helium II. A review. C.F.Barenghi, R.J.Donnelly (Dept. of Phys., Univ. of Oregon, Eugene, OR, USA), W.F.Vinen.
J. Low Temp. Phys. (USA), vol.52, no.3-4, p.189-247 (Aug. 1983).
The authors present an analysis of recent data on friction and drag on quantized vortices in helium II. From these data, they deduce values of the phenomenological and microscopic coefficients of friction on vortex lines and rings over a wide range of temperatures at the saturated vapor pressure. The authors demonstrate that the microscopic parameters are unusually sensitive to the input data. They include brief discussion of the vortex core parameter, and present the results of precision fits of a number of thermodynamic and transport properties of He II which are used in mutual friction calculations. (54 refs.)

102088 Superfluid helium-4 film flow at 11 mK to 1.6K. M.W.Toft, J.G.M.Armitage (Dept. of Phys., Univ. of St. Andrews, St. Andrews, Scotland).
J. Low Temp. Phys. (USA), vol.52, no.3-4, p.343-59 (Aug. 1983).
Experiments on helium-4 film flow over a stainless steel beaker rim have been carried out in the temperature region 11 mK to 1.63K. A study of oscillation damping and low-velocity steady state flow provides the first evidence of dissipation at 'subcritical' transfer rates below 1K and suggests that a dissipation mechanism other than irreversible heat exchange between the bulk liquid reservoirs or the thermal nucleation of vortices and their subsequent transport across the stream is in operation. Flow experiments involving step-function changes in the chemical potential difference between the ends of the film confirmed the existence of a range of metastable 'critical' transfer rates at all temperatures but failed to demonstrate a preferred rate structure. The variation of the mean critical rate with temperature corroborated the results of other workers above 63 mK and extended these measurements to lower temperatures. (40 refs.)

102089 Estimating the intensity of heat transfer to supercritical helium when the specific variation of the thermophysical properties is taken into account. V.G.Pron'ko, G.P.Malyshev (Moscow Sci. & Industrial Assoc. of Helium Technol., Moscow, USSR).
J. Eng. Phys. (USA), vol.43, no.6, p.1350-3 (Dec. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.6, p.932-5 (Dec. 1982).
The authors carry out an analysis of the rules for averaging the thermophysical properties of helium, and on the basis of this analysis they propose a generalizing function for calculating the intensity of heat transfer. (14 refs.)

102090 Low-frequency oscillations of vortices in rotating He II. E.B.Sonin (A.F. Ioffe Physicotech. Inst., Acad. of Sci., USSR).
JETP Lett. (USA), vol.37, no.2, p.100-3 (20 Jan. 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.2, p.82-4 (20 Jan. 1983).
The low-frequency branch of the spectrum of oscillations of a stack of disks in rotating He II with large angular velocities corresponds to excitation of an inertial wave, a well known phenomenon in hydrodynamics of rotating classical fluids, in the volume between the disks. This agrees with the results of experiments by Andereck, Chalupa, and Glaberson (1980). (7 refs.)

102091 Inelastic neutron scattering of helium II below 1K. N.M.Blagoveshchenskii, I.V.Bogoyavlenskii, L.V.Karnatsevich, Zh.A.Kozlov, Yu.Ya.Milenko, V.A.Parfenov, A.V.Puchkov.
JETP Lett. (USA), vol.37, no.3, p.184-7 (5 Feb. 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.3, p.152-4 (5 Feb. 1983).
The temperature dependence of the density of the Bose condensate and of the average kinetic energy per atom in liquid helium has been found through an analysis of neutron inelastic-scattering spectra. The results are discussed. (9 refs.)

102092 The non-equilibrium condensation of spin$^1/_2$ lattice bosons. P.Fazekas, P.Entel (Inst. fur Theoretische Phys., Univ. zu Koln, Koln, Germany).
Phys. Lett. A (Netherlands), vol.97A, no.1-2, p.55-8 (8 Aug. 1983).
A lattice gas model is introduced to study the condensation of bosons possessing two internal states ('spin'). The population of the internal states is out of equilibrium, as suggested for spin-polarized hydrogen. The authors discuss how the presence of two kinds of bosons affects the two condensation temperatures. (8 refs.)

102093 Energy spectrum and hydrodynamics of superfluid He II in a strong electric field. P.N.Brusov, E.D.Gutliansky, V.N.Popov (Res. Phys. Inst., Rostov-on-Don State M.A. Suslov Univ., USSR).
Phys. Lett. A (Netherlands), vol.97A, no.1-2, p.59-60 (8 Aug. 1983).
A strong electric field changes the energy spectrum of elementary excitations in superfluid helium and makes it anisotropic. It is shown that the electric field influences the superfluid hydrodynamics as well, diminishing the superfluid current orthogonal to the field. (5 refs.)

102094 Viscous damping of second sound near the lambda point of liquid ^{4}He. R.A.Ferrell (Dept. of Phys. & Astron., Univ. of Maryland, College Park, MD, USA), J.K.Bhattacharjee.
Phys. Rev. Lett. (USA), vol.51, no.6, p.487-9 (8 Aug. 1983).
The theoretical second-sound damping in ^{4}He II is too small in the background region by 40%. Viscous damping in the normal fluid is identified as the origin of the missing attenuation. Because of simple two-fluid kinematics, this damping grows below the λ point as the superfluid density. The strength of the damping is determined by the coefficient of bulk viscosity, which is already known from the measured background first-sound damping above the λ point. (12 refs.)

102095 Rotons and the density matrix of liquid ^{4}He. S.Battaini, L.Reatto (Istituto di Fisica, Univ. degli Studi di Parma, Parma, Italy).
Phys. Rev. B (USA), vol.28, no.3, p.1263-7 (1 Aug. 1983).
A density matrix for liquid ^{4}He is constructed starting from the elementary-excitation picture. Rotons are described by the Feynman-Cohen wave function. This generalizes Penrose's form for the density matrix that is based on the Feynman form for the wave function. Backflow introduces explicit temperature-dependent three- and four-body correlations in the density matrix in the coordinate representation. The authors have computed the effect of the backflow terms, with the omission of the four-body one, on the structure factor $S(k,T)$ on the basis of the random-phase approximation and of the convolution approximation for the triplet structure factor. They find improved agreement with experiment on the temperature dependence of $S(k,T)$. (16 refs.)

67.50 FERMI FLUIDS; LIQUID HELIUM-3

102096 Anisotropic superfluidity of liquid ^{3}He (fundamental theoretical notions). M.Odehnal (Fyzikalmi Ustav CSAV, Praha, Czechoslovakia).
Cesk. Cas. Fyz. Sekce A (Czechoslovakia), vol.33, no.3, p.209-36 (1983). In Czech.
The article reviews fundamental physical notions of the superfluid phases of liquid ^{3}He. The author discusses the order parameters of various phases, forces orienting the vectors characterizing different phases of ^{3}He, topological singularities and textures, anomalous transverse and longitudinal nuclear magnetic resonances, collective modes and static properties of new phases A, A_1 and B of superfluid ^{3}He. (36 refs.)

102097 The effective mass and the specific heat of normal liquid ^{3}He. V.K.Mishra, G.E.Brown (Dept. of Phys., State Univ. of New York, Stony Brook, NY, USA), C.J.Pethick.
J. Low Temp. Phys. (USA), vol.52, no.5-6, p.379-96 (Sept. 1983).
The behavior of the specific heat of liquid ^{3}He as a function of temperature implies a rapid variation of effective mass with energy. Recently a model has been developed for understanding this. The authors extend this model to explain the low-temperature ($T \leq 100$ mK) specific heat measurements of normal liquid ^{3}He by Greywall (1983). They find that the model gives a reasonably accurate description of the data in this temperature range. (17 refs.)

102098 Thermal expansion, velocity of sound, and compressibility in liquid ^{3}He under pressure. P.R.Roach, Y.Eckstein, M.W.Meisel, L.Aniola-Jedrzejek (Solid State Sci. Div., Argonne Nat. Lab., Argonne, IL, USA).
J. Low Temp. Phys. (USA), vol.52, no.5-6, p.433-47 (Sept. 1983).
The authors have measured the pressure at constant volume $P_v(T)$, of liquid ^{3}He as a function of temperature from 10 to 600 mK and at starting pressures from 1.6 to 28.1 bar. Simultaneously, they determined the hydrodynamic sound velocity c_1, at the same pressures and temperatures. From this data they have derived very accurate values of the isobaric expansion coefficient α_p and the adiabatic compressibility κ. (17 refs.)

102099 Textures and spin waves in rotating superfluid ^{3}He-B. K.W.Jacobsen, H.Smith (Phys. Lab. I, H.C. Orsted Inst., Univ. of Copenhagen, Copenhagen, Denmark).
J. Low Temp. Phys. (USA), vol.52, no.5-6, p.527-37 (Sept. 1983).
The spin wave modes in rotating superfluid ^{3}He-B have been calculated for a texture of cylindrical symmetry. The textural configuration is determined by minimizing the appropriate free energy and solving the resulting Euler-Lagrange equations for the **n** vector. The texture determines the effective potential entering the spin wave equation. The potential deviates significantly from a harmonic oscillator under realistic experimental conditions, giving rise to shifts of the oscillator frequencies. The agreement with the recent experimental observations of Ikkala et al. (1982) is excellent at all temperatures studied. (11 refs.)

102100 Vortices and NMR in rotating ^{3}He-B. S.Theodorakis, A.L.Fetter (Dept. of Phys., Stanford Univ., Stanford, CA, USA).
J. Low Temp. Phys. (USA), vol.52, no.5-6, p.559-91 (Sept. 1983).
The core structure of singly quantized vortices in ^{3}He-B is studied in the Ginzburg-Landau regime. For zero magnetic field, variational estimates indicate a core anisotropy; the gap is suppressed along the component of **n** in the plane perpendicular to the vortex axis within a core of radius $\sim 6\xi$. For large fields ($\sim$300 Oe) parallel to the vortex axis, a similar transverse anisotropy occurs, but its azimuthal direction is degenerate to leading order. The effective coupling constant λ in a rotating system arises from the kinetic energy of the flow, with anisotropy contributions smaller by two orders of magnitude. Predictions about the transverse NMR are compared with the observed resonances; detection of the corresponding longitudinal modes could help confirm the theoretical description. (16 refs.)

102101 Orbital angular momentum in *B* phase of ^{3}He and its effect on the texture in a rotating vessel. G.E.Volovik, V.P.Mineev (L.D. Landau Inst. of Theoretical Phys., Acad. of Sci., USSR).
JETP Lett. (USA), vol.37, no.2, p.127-30 (20 Jan. 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.2, p.103-6 (20 Jan. 1983).
The *B* phase of ^{3}He in a magnetic field **H** has, in addition to the spin angular momentum $\mathbf{S} \sim \mathbf{H}$, an orbital angular momentum $L_i \sim R_{ik}S_k$, where R_{ik} is the rotational matrix entering into the order parameter of ^{3}He-$B \Delta(T) R_{ik} e^{i\phi}$. A change in the energy of the fluid $\Omega \mathbf{L} \sim \Omega_i R_{ik} H_k$ caused by the rotation of the vessel with angular velocity Ω has an orientating effect on the order parameter, comparable in magnitude to the orienting effect on vortices. It is proposed that the magnitude of **L** be measured from the shift of the NMR spectrum in rotating ^{3}He-*B*. (9 refs.)

102102 Comments on surface-induced magnetism of liquid ^{3}He in restricted geometries. H.Jichu, Y.Kuroda (Dept. of Phys., Nagoya Univ., Nagoya, Japan).
Prog. Theor. Phys. (Japan), vol.69, no.5, p.1358-68 (May 1983).
Mechanisms for the surface-induced magnetizations in liquid ^{3}He confined in restricted geometries are studied. Pressure dependence of the effective Curie constants in the observed Curie-Weiss-law-like susceptibilities is well understood within a simple model including paramagnon effects in liquid ^{3}He. The observed magnetization can be regarded as a giant magnetic moment due to the paramagnon effects in liquid ^{3}He induced by localized spins in the solid ^{3}He layer adsorbed on surfaces of substrates of the sample cell. (18 refs.)

102103 Chaotic behavior of magnetization in superfluid ^{3}He driven by external periodic field. Y.Yamaguchi (Dept. of Phys., Sci. Univ. of Tokyo, Tokyo, Japan).
Prog. Theor. Phys. (Japan), vol.69, no.5, p.1377-95 (May 1983).
The nonlinear response of magnetization in superfluid ^{3}He, driven by an external alternating field, is analyzed. Various modes of response, including periodic, quasiperiodic and chaotic modes, are found. In particular, chaotic modes are found in a wide range of the space of the frequency and amplitude of external field. The period doubling bifurcation cascade is found both in A and B phases as a representative route to chaos, and its detailed characteristics are shown to be well interpreted in terms of the theory due to Feigenbaum; the constants δ, α and μ are estimated. The periodic windows are produced by the tangent bifurcation, and the intermittent chaos is obtained as a precursor effect of this tangent bifurcation. A sudden change of the chaotic attractor is found, and interpreted in terms of the concept of 'crisis', recently proposed by Grebogi et al. (1982). Finally the experimental implication of the authors results is discussed. (42 refs.)

102104 Observation of the mechanical response of the condensate in He-*B* in the regime of negligible normal fluid density. A.M.Guenault, V.Keith, C.J.Kennedy, G.R.Pickett (Dept. of Phys., Univ. of Lancaster, Lancaster, England).
Phys. Rev. Lett. (USA), vol.51, no.7, p.589-92 (15 Aug. 1983).
Experiments are described in which superfluid ^{3}He-*B* is cooled to sufficiently low temperatures that the normal-fluid fraction becomes so small ($\rho_n/\rho < 10^{-6}$) that the quasiparticle properties become undetectable. The liquid ^{3}He is then effectively a thermal vacuum. In this regime nonlinear effects are observed in the behaviour of a vibrating wire, effects which are not observed in an actual vacuum and which are evidently associated with the mechanical response of the *B*-phase superfluid texture. (6 refs.)

102105 Is the nonlinear zero sound in superfluid ^{3}He a soliton?. H.Ebisawa (Tokyo Univ., Tokyo, Japan).
Solid State Phys. (Japan), vol.18, no.2, p.95-100 (Feb. 1983). In Japanese.
The soliton phenomenon as observed in superfluid ^{3}He both via magnetic and NMR means and zero acoustic wave is reviewed. Zero acoustic wave and acoustic wave resonance absorption are explained. (14 refs.) *M.O.*

67.60 MIXED SYSTEMS; LIQUID HELIUM 3-4 MIXTURES

102106 Lagrange thermodynamic potential and intrinsic variables for ^{3}He-^{4}He dilute solutions. H.W.Jackson (Jet Propulsion Lab., California Inst. of Technol., Pasadena, CA, USA).
Phys. Rev. B (USA), vol.28, no.3, p.1286-93 (1 Aug. 1983).
A thermodynamic potential that provides a Lagrangian for derivation of equations of motion by a variational procedure is constructed for a two-fluid model of dilute solutions of ^{3}He in liquid ^{4}He. For uniform velocity fields this Lagrangian is defined as a (negative) Legendre transform of total internal energy, and its primary independent variables together with their thermodynamic conjugates are identified. Similarities between relations in classical physics and in quantum statistical mechanics provide a guide for developing an alternate expression for this function that reveals its character as the difference between apparent kinetic energy and intrinsic internal energy. This expression reduces to Zilsel's formula (1950) for the Lagrangian for pure liquid ^{4}He when the ^{3}He concentration in the mixtures tends to zero. Study of properties of the intrinsic internal energy leads to the introduction of intrinsic chemical potentials along with other intrinsic variables for the mixtures. Explicit formulas for these variables are developed for a noninteracting elementary excitation model of the fluid. With the aid of those formulas and others also derived from quantum statistical mechanics, another equivalent expression for the Lagrangian is generated. When the ^{3}He concentration in the mixtures tends to zero, this expression reduces to the Lagrangian in Lhuillier, Francois, and Karatchentzeff's extension (1975) of Khalatnikov's phenomenological two-fluid theory of pure liquid ^{4}He (1965). The underlying unity of the seemingly different theories of Zilsel and of Khalatnikov established in earlier work for pure liquid ^{4}He is thereby extended here to dilute mixtures of ^{3}He in ^{4}He. (26 refs.)

102107 Critical dynamics near the λ transition in ^{3}He-^{4}He mixtures. V.Dohm (Inst. fur Festkorperforschung, KFA Julich, Julich, Germany), R.Folk.
Phys. Rev. B (USA), vol.28, no.3, p.1332-69 (1 Aug. 1983).
The critical dynamics of the λ transition in ^{3}He- ^{4}He mixtures are studied by means of renormalized field theory applied to the model of Siggia and Nelson. A diagonal representation for the equations of motion is introduced, which greatly simplifies the computations in two-loop order. A universal connection is found with the asymptotic critical dynamics of pure ^{4}He in all orders of perturbation theory. The observable critical dynamics of helium mixtures are dominated by nonuniversal crossover effects which can be properly described only within a nonlinear renormalization-group approach. The theory is applied to explain the observable critical and precritical temperature dependence of the mass diffusion D, of the thermal conductivity κ, of the thermal diffusion ratio k_T, and of the dynamic structure factor for $T \geq T_\lambda(X)$. Recent experimental data for the transport coefficients at the molar ^{3}He concentration $X=0.05$ by Gestrich and Meyer are used to identify the nonuniversal parameters of the theory in the range $X \ll 1$. Consistency with the dynamics of pure ^{4}He ($X=0$) is verified. Predictions without adjustable parameters are made for the dynamic structure factor and the transport coefficients in very dilute mixtures. The Siggia-Kawasaki problem concerning the leading X dependence of $\kappa(T_\lambda)$ in the $X \to 0$ limit is resolved. It is demonstrated that Siggia's prediction $\kappa(T_\lambda) \sim X^{-1}$ is correct but not observable. Theoretical extrapolations to $X > 0.05$ without adjustable parameters are presented and compared with measured transport coefficients at $X=0.11$ and 0.15. The overall agreement is satisfactory. Deviations of order 15% exist with the thermal conductivity κ at $X=0.15$. This may be attributed to dynamic effects arising from the singular specific heat and mass susceptibility, which are not included in the present analysis. (105 refs.)

102108 Bose spectrum of superfluid systems of the He^3-He^4 type. P.N.Brusov (Sci.-Res. Inst. of Phys., State Univ., Rostov-on-Don, USSR), V.N.Popov.
Theor. & Math. Phys. (USA), vol.53, no.3, p.1235-43 (Dec. 1982). Translation of: *Teor. & Mat. Fiz. (USSR)*, vol.53, no.3, p.444-55 (Dec. 1982).
The collective modes of Bose excitations of model Fermi-Bose systems are investigated. Three-dimensional models of the He^{3}A-He^4 and He^{3}B-He^4 systems are investigated, and also models of He^3-He^4 films in which the He^3 component can be in superfluid phases *a* and b. For all models, a hydrodynamic (effective) action functional is constructed which makes it possible to find the Bose spectrum of the considered systems. The interaction of the Fermi and Bose subsystems leads to interaction of the acoustic modes of both subsystems and hardly influences the other modes of the Bose spectrum. A biquadratic equation is obtained for the velocities of the acoustic modes; this equation does not change on the transition from the A to the B phase in the three-dimensional models or from the *a* to the b phase in the models of He^3-He^4 films. (12 refs.)

67.80 SOLID HELIUM AND RELATED QUANTUM CRYSTALS

102109 On the law of the change of the quantum crystal heat capacity C, near the melting point. B.G.Udovidchenko.
Fiz. Nizk. Temp. (USSR), vol.9, no.7, p.749-52 (July 1983). In Russian. English translation in: *Sov. J. Low Temp. Phys. (USA)*
Presented is an approach to the analysis of the quantum crystal lattice dynamics near the melting line which proved efficient in describing the nature of temperature dependence of their heat capacity C_v in the said temperature range. Comparison with the available C_v data of ^{3}He, ^{4}He and p-H_2 for a density range varying roughly by a factor of 1.5 corroborates the validity of the quantum crystal C_v change law for a temperature range increasing with the crystal density and reaching 0.42 T_{melt} for p-H_2, $P_{melt} \approx 2400$ bar. (18 refs.)

102110 Investigation of electrons localized above solid hydrogen by means of the cyclotron resonance method. V.S.Edel'man, M.I.Faley (S.I. Vavilov Inst. of Phys. Problems, Acad. of Sci., Moscow, USSR).
J. Low Temp. Phys. (USA), vol.52, no.3-4, p.301-14 (Aug. 1983).
The magnetoresistance and cyclotron resonance of a two-dimensional sheet of electrons localized above liquid and solid hydrogen surfaces are investigated at the frequency of 20 GHz. It is found that the effective electron mass relevant to the motion along the surface is close to the free electron mass. The electron mean free path is determined by collisions with defects of the solid hydrogen surface. For $5 \lesssim T \lesssim 12$K the electron mobility was $\sim 8 \times 10^4/T$ cm^2/V sec, with 20% accuracy, for all the specimens investigated. For $T \lesssim 5$K the mobility follows the law $\mu \propto 1/\sqrt{w_e}$, where W_e is the mean electron energy. The numerical values of the electron mobilities for different specimens differ by factors up to five, and for $T \lesssim 1$K they fall within the range 2×10^4 to 10^5 cm^2/V sec. The experimental results indicate that the solid hydrogen surface has a terrace structures with flat sections about 10^{-5} cm in size.

During the investigation of electrons localized above a saturated helium film wetting the solid hydrogen, the authors observed a shift of the resonance to weaker magnetic fields, which amounts to ~100% at a pressing field of ~10^3 V/cm. It is shown that this shift can be explained by the terrace structure of the substrate. (10 refs.)

102111 A four-sublattice model for solid ^{3}He. J.M.Goodkind (Dept. of Phys., Univ. of California, San Diego, La Jolla, CA, USA).
J. Low Temp. Phys. (USA), vol.52, no.3-4, p.335-41 (Aug. 1983).
Nuclear magnetic resonance measurements on the antiferromagnetic ordered phase of solid ^{3}He have indicated that the magnetic structure consists of ferromagnetically ordered parallel planes of atoms. The magnetization vectors lie in the planes and are aligned in a sequence with two or more in a row pointing in the same direction followed by the same number pointing in the opposite direction. In the simplest case, with only two in a row pointing in the same direction, the system can be described in terms of sublattices if four are used. In this work the appropriate four-sublattice model is solved for the uniform free normal modes and for the excitation of the modes by density oscillations. (9 refs.)

102112 Pressure-induced rotation-libration transition in molecular solid hydrogen. A comparison between interaction potentials. I.Aviram, S.Goshen (Nuclear Res. Center Negev, Beer Sheva, Israel), R.Thieberger.
J. Low Temp. Phys. (USA), vol.52, no.5-6, p.397-407 (Sept. 1983).
The pressure-induced rotation-libration transition in solid molecular para-H_2 and ortho-D_2 is calculated using anisotropic nearest neighbor interaction potentials of the form $V_{ij}=\Sigma_m C_m(r_{ij})Y_{2m}(\Omega_i)Y_{2-m}(\Omega_j)$. The contribution of various m terms is investigated. It is found that, for a trial wave function of Jastrow type, the expectation of the $m=1$ term vanishes, while the ratio between the expectations of the $m=0$ and $m=2$ terms is a rational numerical constant. The trial wave function incorporates two variational parameters and the variational integrals are evaluated by a Monte Carlo procedure. The potentials of Ree and Bender (1979), and of Van Kranendonk (1965) and Nakamura (1955) were compared to each other. The Ree and Bender potential seems to be better suited for describing high-density properties, although the transition pressure turned out to be well above the experimental value. (14 refs.)

102113 Annealing of defects in plastically deformed ^{4}He crystals. A.A.Levchenko, L.P.Mezhov-Deglin (Inst. of Solid State Phys., Acad. of Sci., USSR).
JETP Lett. (USA), vol.37, no.4, p.205-7 (20 Feb. 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.4, p.173-4 (20 Feb. 1983).
The activation energy for diffusion of dislocations in deformed ^{4}He crystals, grown under a pressure of 31 atm, coincides with the activation energy of vacancies in specimens with the same density, as well as with the characteristic activation energy of ^{3}He impurity atoms and charges in the region of thermally activated motion. (3 refs.)

102114 Pinning of dislocations in HCP and BCC ^{3}He by stress waves and by ^{4}He impurities. J.R.Beamish, J.P.Franck (Dept. of Phys., Univ. of Alberta, Edmonton, Alberta, Canada).
Phys. Rev. B (USA), vol.28, no.3, p.1419-32 (1 Aug. 1983).
Large-amplitude ($\gtrsim 200$ N/m^2) ultrasonic pulses at a frequency of 3 MHz were observed to pin dislocations in pure HCP and BCC ^{3}He below 300 mK. Unpinning occurs as a thermally activated process above about one-half of the melting temperature. Activation energies obtained from the unpinning process are in good agreement with activation energies for thermally activated mobile vacancies. Doping with ^{4}He impurities at levels above about 1500 ppm also leads to dislocation pinning. In these impure crystals stress-induced breakaway was observed. In crystals with strongly pinned dislocations the sound attenuation was found to follow the zero-sound behavior at low temperatures. (26 refs.)

102115 Observation of thermal remanence in a quadrupolar solid. D.G.Haase, M.A.Klenin (Phys. Dept., North Carolina State Univ., Raleigh, NC, USA).
Phys. Rev. B (USA), vol.28, no.3, p.1453-6 (1 Aug. 1983).
The authors have measured the specific heat of solid hydrogen as a function of temperature and orthohydrogen concentration in the region of the FCC-HCP phase boundary, and have found a dependence of this quantity on thermal history. Samples isothermally converted from the FCC to the HCP phase showed a slow continuous change to molecular disorder, which is somewhat analogous to remanence in spin-glass field-cooling experiments. New Monte Carlo simulations indicate remanence can be caused by the HCP geometry and quadrupolar-site dilution, independently of the FCC-HCP structural change. (19 refs.)

Atomic and molecular hydrogen and deuterium: quantum gases and solids ....See Entry 102116

67.90 OTHER TOPICS IN QUANTUM FLUIDS AND SOLIDS (E.G. NEUTRON-STAR MATTER)

102116 Atomic and molecular hydrogen and deuterium: quantum gases and solids. I.F.Silvera (Lyman Lab. of Phys., Harvard Univ., Cambridge, MA, USA).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.3-13 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
After the first succesful stabilization of atomic gases of spin-polarized hydrogen ($H\downarrow$) and deuterium ($D\downarrow$), a series of experiments were carried out to study their properties. Most challenging has been the attempt to observe Bose Einstein condensation in $H\downarrow$. The access to the required high density has been limited by recombination. Experiments demonstrated that this takes place on the ^{4}He or ^{3}He-^{4}He surfaces of the cell. Techniques were developed to measure surface adsorption energies and recombination mechanisms. $H\downarrow$ on the helium surface was recognized as an almost ideal 20-dim gas that can also be a superfluid. Recent advances have enabled the polarization of the nuclear as well as the electron spin, suppressing the most important recombination mechanism. This has been directly demonstrated by ESR measurements. Significantly higher densities and thus phenomena of the degenerate quantum gases are promised. Molecular hydrogen and deuterium form lattices of quantum mechanical free rotors at $T\simeq 14$K and low pressure. Increasing density of the solid distorts this picture. Pressures as high as 600 kbar have been achieved at $T=1.1$K. In solid ortho-deuterium a broken rotational symmetry phase transition has been observed at 278 kbar while H_2 maintains its low pressure state to the highest densities yet achieved. At still higher pressures a transition to a metallic phase is expected. Equation of state measurements predict this to be in the 2-6 megabar region. (26 refs.)

102117 Compression of spin-polarized hydrogen to high density. R.Sprik, J.T.M.Walraven (Natuurkundig Lab., Univ. van Amsterdam, Amsterdam, Netherlands), I.F.Silvera.
Phys. Rev. Lett. (USA), vol.51, no.6, p.479-82 (8 Aug. 1983).
A new technique enabled the authors to compress doubly polarized hydrogen by up to five orders of magnitude and study the sample in very small volumes at constant density up to $2\times 10^{18}/\mathrm{cm}^3$. The first determination of the bulk three-body dipolar recombination rate was made, ${K_V}^{3b}=4(1)\times 10^{-39}$ cm^6 s^{-1}. The authors also identified a new process, bulk electronic dipolar $b\rightarrow c$-state relaxation with rate constant ${G_V}^{bc}\exp(2\mu_B B/k_B T)=8(4)\times 10^{-16}$ cm^3 s^{-1}. Samples were very delicate and too rapid a compression could result in an explosion. (9 refs.)

102118 Observation of three-body recombination in spin-polarized hydrogen. H.F.Hess, D.A.Bell, G.P.Kochanski, R.W.Cline, D.Kleppner, T.J.Greytak (Dept. of Phys., MIT, Cambridge, MA, USA).
Phys. Rev. Lett. (USA), vol.51, no.6, p.483-6 (8 Aug. 1983).
Three-body recombination in spin-polarized hydrogen has been observed. Doubly polarized hydrogen was compressed by a piston into a thin cell and the temperature and pressure were independently monitored. Measurements were carried out in the temperature range 0.3 to 0.45K in a magnetic field of 8.0 T at densities up to 1.5×10^{18} cm^{-3}. The results are in good agreement with the theory of Kagan, Vartanyants and Shlyapnikov (1982). (10 refs.)

(inc. surface tension, capillarity, wetting and related phenomena)

102119 Equilibrium and spreading of liquids on solid surfaces. A.Marmur (Dept. of Chem. Engng., Technion-Israel Inst. of Technol., Haifa, Israel).
Adv. Colloid & Interface Sci. (Netherlands), vol.19, no.1-2, p.75-102 (July 1983).
Contact angle equilibrium and dynamic spreading of liquids on solid surfaces are reviewed and discussed. The thermodynamic status of the Young equation is critically reviewed. It is redeveloped rigorously and shown to apply locally, even for rough and heterogeneous though rigid and insoluble solid surfaces, when written in terms of the local interfacial tensions. The line tension approach and the molecular approach to relate the local interfacial tensions to their values far away from the three-phase contact line are critically discussed, and the difficulties with some recent corrections of the Young equation are explained. The problem of the shape of the fluid-fluid interface near the contact line is analysed, and it is shown that a discontinuous transition has to occur between the solid surface and the fluid-fluid interface. Experimental data and theoretical models for dynamic spreading are discussed and compared. (77 refs.)

102120 Measurement of low interfacial tensions under high hydrostatic pressures. B.Thiebot, J.Briant (Inst. Francais du Petrole, Rueil-Malmaison, France).
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.16, p.1221-4 (2 May 1983). In French.
The ability of the sessile drop and of the pendant drop methods for measuring low interfacial tensions are shown. These methods present also the advantage of being easily suitable to measurements under high pressures at elevated temperatures. Experimental results show the influence of high hydrostatic pressures on low interfacial tensions. (5 refs.)

102121 The wetting liquid-vapor interface of a binary liquid mixture. D.Beaglehole (Phys. Dept., Victoria Univ. of Wellington, Wellington, New Zealand).
J. Chem. Phys. (USA), vol.79, no.3, p.1469-73 (1 Aug. 1983).
The paper includes gravitational effects in the Cahn squared-gradient model for the wetting liquid-vapor interface, and determines the temperature dependence of the wetting layer thickness for both regular solution and nonclassical free energy functionals. (13 refs.)

102122 The meniscus on a needle—a lesson in matching. L.L.Lo (Dept. of Mech. Engng., Stanford Univ., Stanford, CA, USA).
J. Fluid Mech. (GB), vol.132, p.65-78 (July 1983).
The author reconsiders the second approximation for the height of the meniscus on a slender vertical cylinder, which has been calculated by James using the method of matched asymptotic expansions. Fraenkel has warned that the asymptotic matching principle may fail in certain cases, and the author confirms that failure here. This meniscus problem is used to discuss the kind of failures that may occur if Fraenkel's restricted form of the matching principle is not used. A less restricted matching principle is also suggested. With this matching principle, the author shows that the last known term of order $Re^3 \ln Re$ in the drag on a sphere in low-Reynolds-number flow is correct, even though it was found in a way that violates Fraenkel's warning. (11 refs.)

102123 Determination of surface tension coefficient of liquid metals and alloys using the phenomenon of capillary wave formation. K.Rozniakowski (Inst. of Phys., Tech. Univ. of Lodz, Lodz, Poland).
Mater. Res. Bull. (USA), vol.18, no.7, p.875-9 (July 1983).
A possibility of determining the surface tension coefficient of 6H13 liquid steel and of technically pure ion (Armco-Fe) has been presented. In the investigation the phenomenon of ring structure formation (capillary waves) on the surface of a molten metal affected by light pulses of a glass neodymium laser ($\lambda=1.06$ μm, $\tau_i\approx 1$ ms, $E_i\approx 6$J) has been considered. The values obtained for the surface tension coefficent are in good agreement with those determined by other methods (for liquid metals in the temperature range 2000K-5000K). (10 refs.)

102124 Direct observation of layer-to-layer wetting of graphite by ethylene. M.Sutton, S.G.J.Mochrie, R.J.Birgeneau (Dept. of Phys., MIT, Cambridge, MA, USA).
Phys. Rev. Lett. (USA), vol.51, no.5, p.407-10 (1 Aug. 1983).
It has been demonstrated directly by use of X-ray diffraction that at temperatures below the triple point of bulk ethylene (103.8K) adsorption of ethylene onto the basal planes of graphite only occurs up to a finite number of molecular layers. Further addition of molecules results in the formation of

bulk crystallites. Reversible transitions between the total number of layers adsorbed and the coexisting bulk are observed. (8 refs.)

68.15 LIQUID THIN FILMS

102125 Thin films and froth flotation. J.Ralston (Dept. of Appl. Chem., Swinburne Inst. of Technol., Hawthorn, Victoria, Australia).
Adv. Colloid & Interface Sci. (Netherlands), vol.19, no.1-2, p.1-26 (July 1983).
The properties of thin, aqueous films on solid surfaces and their central role in the froth flotation process are discussed. The stability of these films can generally be described in terms of electrostatic and van der Waals forces. Significant experimental and theoretical advances are required in many areas (e.g. short range forces, film drainage) before a clear picture of the collision of, adhesion between and detachment of bubbles and particles will emerge. (114 refs.)

102126 Studies of two-dimensional lattices using ferrofluid. A.T.Skjeltorp (Inst. for Energy Technol., Kjeller, Norway).
J. Magn. & Magn. Mater. (Netherlands), vol.37, no.3, p.253-6 (July 1983).
By exerting a magnetic field H normal to a ferrofluid layer, a triangular lattice of droplets is formed when H exceeds a characteristic critical field. The lattice may be 'heated' by reducing H and the effects of dislocations and disclinations may be studied. This offers a new experimental system for direct visual observations of phenomena related to two-dimensional melting. (13 refs.)

102127 Effects of mass flux, flow quality, thermal and surface properties of materials on rewet of dispersed flow film boiling. O.C.Iloeje (Dept. of Mech. Engng., Univ. of Nigeria, Nsukka, Nigeria), D.N.Plummer, W.M.Rohsenow, P.Griffith.
Trans. ASME. J. Heat Transfer (USA), vol.104, no.2, p.304-8 (May 1982).
The effects of mass flux, flow quality, material thermal properties, surface roughness, and surface oxidation on the rewet-wall superheat for dispersed vertical flow were experimentally investigated. The mass fluxes tested were 40.7, 81.4, 169.5 and 271.3 kg/s-m^2. Flow qualities varied from 10-90 percent. The test materials were copper, aluminum, and inconel-600. Overall dimensions of the test pieces were 10.16 mm i.d., 25.4 mm OD, and 25.4 mm long. A smooth inside surface was prepared for each material, with roughness amplitudes of approximately 0.5 μm. Two inconel test pieces had roughnesses of 15-20 μm and 66 μm, respectively. Another inconel piece was oxidized to a thin oxide layer of approximately 1.3 μm. The test fluid was liquid nitrogen. The results incidated that the rewet wall superheat increased with mass flux. The rewet wall superheat decreased with increasing flow quality, with the rate of decrease being more rapid at higher mass fluxes and higher qualities. Increases in wall roughnesses, and the presence of surface oxidation, increased the rewet superheat. The effect of an oxide layer increased with increasing mass flux and decreasing quality, and was thought to result from the decrease in contact angle between the liquid and the oxidized surface. Differences in wall thermal properties were not very significant up to a mass velocity of 81.4 kg/s-m^2. Above this mass flux, the copper data did not clearly show the increasing T_{min} with increasing mass flux, while the inconel data did. A comparison of T_{min} for several materials with different thermal properties therefore was not made above mass flux of 81.4 kg/s-m^2. (9 refs.)

68.20 SOLID SURFACE STRUCTURE

102128 Surface variations in chemical composition of titanium disulphide single crystals. A.A.Balchin (School of Phys., Brighton Polytech., Brighton, England).
J. Mater. Sci. Lett. (GB), vol.2, no.8, p.457-62 (Aug. 1983).
In order to determine the stoichiometry of crystals grown by iodine vapour transport, a study has been made of single crystals of TiS_2 by Auger and ESCA spectroscopy. Chemical analyses of trace impurities and of variations of chemical composition with depth below the surface of the crystal were obtained. (5 refs.)

102129 Surface reconstruction and adsorbate geometry by surface core level spectroscopy. J.Lecante, C.Guillot (Service de Phys. des Atomes et des Surfaces, CENS, Gif-sur-Yvette, France).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.427-33 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
Previous studies on surface core level shifts have shown the interest of the core level spectroscopy as a very sensitive probe of surface layers. A brief review of the experimentally measured core level shifts is given and also a survey of a theoretical model using the tight binding approximation. Several applications of this new technique are presented concerning clean surface reconstruction and chemisorption studies. (5 refs.)

102130 Surface compositional studies of heat reduced lead silicate glass. J.M.Simeonova (Central Lab. for Space Res., Bulgarian Acad. of Sci., Sofia, Bulgaria), J.S.Kourtev, Y.B.Dimitriev.
J. Non-Cryst. Solids (Netherlands), vol.57, no.1, p.177-87 (Aug. 1983).
SIMS and AES compositional analysis of the surface layer for a lead silicate glass reduced at three different temperatures was carried out and the depth distribution for some components to a depth of 120 nm was obtained. It was found that by increasing the reduction temperature the layer located just below the surface becomes rich in silicon oxides, a potassium accumulation takes place on the surface and the depth distribution of the other chemical components exhibits a maximum, the location of which depends on the reduction temperature. (23 refs.)

102131 Cation valencies and surface segregation in copper ferrites under X-ray photoelectron spectroscopy conditions. V.A.M.Brabers (Dept. of Phys., Eindhoven Univ. of Technol., Eindhoven, Netherlands).
Mater. Res. Bull. (USA), vol.18, no.7, p.861-8 (July 1983).
Cu2p XPS spectra of copper ferrites and copper magnesium manganite are reported. It turns out that the surface layer of the ferrites are enriched with copper and that for the so-called cuprous ferrite $Cu_{0.5}$-$Fe_{2.5}O_4$, a decomposition in the surface layer occurs into α-Fe_2O_3 and $CuFeO_3$. Evidence is found that in the ferrites only monovalent copper in A sites is present at room temperature and bivalent copper in A and B sites. The tetrahedral Cu^+ ions show a remarkable negative shift of the core levels in comparison with metallic copper (1.4-1.7 eV). (16 refs.)

102132 Thermal self-decoration of GeS crystals. J.Vetter, H.Bethge (Inst. of Solid State Phys. & Electron Microscopy, Acad. of Sci., Halle, Germany).
Phys. Status Solidi a (Germany), vol.78, no.1, p.103-9 (16 July 1983).
On annealing GeS single-crystals in a vacuum a self-decoration of surface steps is found to appear which is observable in a scanning electron microscope. The effect occurs on vacuum-cleaved as well on air-cleaved samples. On the basis of X-ray microanalysis, Auger electron spectroscopy, and electron diffraction the observed decoration is shown to be due to Ge precipitates resulting from a preferred evaporation of the S component. (12 refs.)

102133 Structure of graphitic carbon on Ni(111): a surface extended-energy-loss fine-structure study. R.Rosei, M.de Crescenzi (Dipartimento di Fisica, Univ. della Calabria, Cosenza, Italy), F.Sette, C.Quaresima, A.Savoia, P.Perfetti.
Phys. Rev. B (USA), vol.28, no.2, p.1161-4 (15 July 1983).
The structural parameters of the graphitic carbon overlayer on a Ni(111) substrate has been determined by using surface extended-energy-loss fine-structure spectroscopy. The authors find that graphitic carbon is very similar to a graphite single-crystal plane, but slightly expanded (~2%), with C-C_1 and C-C_2 distances of 1.45 ± 0.03 and 2.50 ± 0.03 Å, respectively. The graphite overlayer floats at 2.80 ± 0.08 Å above the Ni(111) face. The C-Ni interaction is strong enough to force the overlayer in registry with the substrate. However, they find that the Ni-Ni distance remains identical, showing that the substrate is not affected by the growth of the graphitic overlayer. (27 refs.)

102134 New results on the quenched '1×1' structure of Si{111} surfaces. W.S.Yang, F.Jona (Dept. of Materials Sci. & Engng., State Univ. of New York, Stony Brook, NY, USA).
Phys. Rev. B (USA), vol.28, no.2, p.1178-80 (15 July 1983).
The '1×1' structure known to form from the 7×7 structure at high temperatures on Si{111} surfaces was studied at room temperature after quenching from 1200°C. Comparisons of low-energy electron diffraction spectra both at normal and off-normal incidence from this quenched phase with corresponding spectra from the Te-stabilized 1×1 surface show that these phases are not the same. The quenched phase exhibits weak but sharp $^1/_2$-order beams that reveal the presence of large 2×1 domains. There is some indication that the 2×1 distortion may be similar to that of the cleaved 2×1 structure, thus implying that the 2×1 phase of Si{111} is not metastable, as heretofore believed, but indeed very stable. (14 refs.)

102135 Channeling and optical study of thin Si crystals distorted by pressure. R.B.Alexander, P.J.Drallos, S.C.Johnson, K.R.Padmanabhan (Dept. of Phys. & Astron., Wayne State Univ., Detroit, MI, USA), J.C.Buchholz.
Phys. Rev. B (USA), vol.28, no.3, p.1207-13 (1 Aug. 1983).
The ion backscattering-channeling technique and reflection of laser light have been used to study the distortion of thin Si single crystals produced by a pressure differential across the crystal. For channeling in a Si-air cell, the channeled fraction at a fixed pressure decreases with increasing ion energy, beam diameter, and crystal area, and increases with crystal thickness. The threshold pressure for the abrupt decrease in the channeled fraction behaves in the same way. From an interference pattern observed in the reflected laser beam, the shape of the distorted Si surface can be deduced. The maximum deformation, which is a sublinear function of pressure, decreases with increasing crystal thickness. Calculations have been made on the channeled fraction from the results of the optical measurements, with the use of a geometric model in which the channeling minimum yield is determined by the distribution of angles of ion incidence over the bowed crystal surface. Comparison of calculated and measured values of the channeled fraction suggests that both rigidity and membrane stresses determine the crystal shape. (11 refs.)

102136 A comment on the W(001) surface stability and reconstruction. S.Pick, M.Tomasek (J. Heyrovsky Inst. of Phys. Chem. & Electrochem., Czechoslovak Acad. of Sci., Prague, Czechoslovakia).
Surf. Sci. (Netherlands), vol.130, no.1, p.L307-10 (July 1983).
Arguments are presented in favour of an additional softening which those changes of surface force constants that lead to a pronounced 'soft' surface phonon mode (e.g. M_5) can invoke in the global surface phonon spectrum. This result is illustrated for the W, Mo and Cr (001) surface. Analysis of phonons at an isolated layer is used together with a 'perturbation theorem'. (18 refs.)

102137 Ordered steps on Bi(~0001) vicinal surfaces by laser pulse anneal. W.P.Ellis, K.A.Thompson, N.S.Nogar (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA).
Surf. Sci. (Netherlands), vol.130, no.1, p.L317-23 (July 1983).
LEED patterns characteristic of an ordered array of equally spaced steps of minimum height resulted from pulsing disordered Bi(~0001) vicinal surfaces. Ten XeCl excimer laser pulses at $\lambda=308$ nm, of 10 ns duration and 4 mJ/cm^2 each and at 0.5 s intervals optimized ordering on the Bi$(10\bar{1}16)$ surface, but additional exposure degraded the surface crystallinity as did a twentyfold increase in power density. (15 refs.)

102138 He diffraction from clean Pt(111) and (1×1) H/Pt(111) surface. J.Lee, J.P.Cowin, L.Wharton (James Franck Inst., Univ. of Chicago, Chicago, IL, USA).
Surf. Sci. (Netherlands), vol.130, no.1, p.1-28 (July 1983).
He diffraction from clean and hydrogen-covered Pt(111) has been observed and used to investigate their surface structure. Hydrogen adsorbs in a well-

ordered (1×1) overlayer structure on Pt(111) at 160K. The binding site of C_{3v} symmetry is deduced from in-plane as well as out-of-plane diffraction intensity distributions. Furthermore, the (1×1) overlayer contains a single adsorption state which occupies only one type of three-fold hollow sites. At ≤150K a new low-temperature state is found to populate to result in a disordered overlayer. The hard corrugated wall analysis of the diffraction intensities is made to obtain the surface topography. The clean Pt(111) surface can be described by a corrugation amplitude of 0.01 Å, remarkably flat. The (1×1) H/Pt(111) surface requires an additional corrugation of amplitude 0.13 Å on each second three-fold minimum of the basic corrugation, which is increased to 0.05 Å by hydrogen adsorption. Based on the surface corrugation of the (1×1) H overlayer, which of the two possible three-fold hollow sites (HCP or FCC site) is preferred by the hydrogen atom is discussed. (28 refs.)

102139 Surface reconstruction of Cu(111) upon oxygen adsorption. H.Niehus (Inst. fur Grenzflachenforschung und Vakuumphys., KFA Julich, Julich, Germany).
Surf. Sci. (Netherlands), vol.130, no.1, p.41-9 (July 1983).
Low-energy He^+ ion scattering (IS) in combination with AES, LEED and work function measurements has been applied for the determination of surface reconstruction of Cu(111) upon oxygen adsorption. IS data clearly indicate that oxygen is not significant incorporated into the bulk at room temperature adsorption; however the surface shows reconstruction by displacement of Cu atoms by 0.3 Å. The disappearance of structure of both Cu_{IS} and O_{IS} in the 'ϕ_{in} pattern' demonstrates the development of a disordered layer of reconstruction centres. At saturation coverage, a rough and dis-ordered oxygen-copper surface layer is present. (24 refs.)

102140 X-ray spectral study of the surface of flat glass. N.N.Semenov, Yu.N.Romashchenko, I.A.Brytov, L.B.Vasil'eva, K.B.Kostin, S.Ya.Shulov, L.A.Samsonova (All-Union Sci.-Res. Inst. of Specialized & Tech. Glass, Saratov, USSR).
Sov. J. Glass Phys. & Chem. (USA), vol.8, no.4, p.277-80 (July-Aug. 1982). Translation of: *Fiz. & Khim. Stekla (USSR)*, vol.8, no.4, p.412-15 (July-Aug. 1982). [received: May 1983]
By comparison with the upper surface, the covalent component of the Si-O bonds in the surface layer (~150 Å) on the lower surface of heat-polished glass increases as a result of the decrease in the positive charge on the Si atoms. This is caused by the incorporation of the tin atoms from the melt into the silicon-oxygen framework and by the formation of groups which are structurally similar to tin silicates. Electrochemical treatment of the glasses leads to a less significant change in the parameters of the $SiL_{2,3}$ sqy than in the case where the surface of the glass is in contact with the tin melt, i.e. the maximum distribution of the impurity atoms of Cu and Pb lies at a depth greater than the 150-200 Å accessible to this method of research while the ionicity of the Si-O bonds in the electrochemically treated glasses increases by comparison with the heat-polished glass (upper surface). This is associated with the migration of sodium ions into the depth of the glass. An increase in the temperature of the electrochemical treatment shifts the maximum of the distribution of impurity Cu and Pb into the depth of the glass but the ionicity of the Si-O bonds in this case is very little changed; it is at the greatest with a medium treatment temperature when the maximum migration of sodium ions from the surface of the glass is achieved. (5 refs.)

102141 Surface structural damage produced in InP(100) by RF plasma or sputter deposition. W.C.Dautremont-Smith, L.C.Feldman (Bell Labs., Murray Hill, NJ, USA).
Thin Solid Films (Switzerland), vol.105, no.2, p.187-96 (15 July 1983).
Rutherford backscattering detected at grazing angle under channeling conditions was employed to observe and quantify surface structural damage to InP(100) produced by dielectric deposition methods involving direct 13.56 MHz RF plasma exposure. Sputter deposition at any plasma power produced surface damage, to a maximum depth of about 30 Å at power densities within the range 0.25-2.2 W cm^{-2}. In contrast, damage due to plasma deposition was not observable at any plasma power density up to 0.32 W cm^{-2} for InP substrates at either 250 or 31°C. This power level produced the high SiO_2 deposition rate of 1500 Å min^{-1}. Thus plasma deposition is particularly applicable to InP, whereas diode sputter deposition should be voided for any application in which structral damage may be detrimental. (22 refs.)

102142 $Pt_{50}Ni_{50}$ and $Pt_{78}Ni_{22}$(111) single crystal alloys: superficial composition determination by ion scattering and Auger spectroscopy. L.De Temmerman, C.Creemers, H.Van Hove, A.Neyens (Fysico-Chem. Lab., Katholieke Univ. Leuven, Leuven, Belgium), P.Delichere, J.Massardier, B.Tardy, M.Abon, J.C.Bertolini.
Vide les Couches Minces (France), vol.38, no.217, p.275-8 (May-July 1983). In French.
The surface composition of $Pt_{50}Ni_{50}$(111) and $Pt_{78}Ni_{22}$(111) single crystal alloys has been determined from ion scattering and Auger spectroscopy experiments. The clean surface is largely enriched with platinum leading to a quasicomplete Pt layer in the surface. The Pt enrichment spreads at further depths of this monolayer, particularly in the $Pt_{78}Ni_{22}$(111) single crystal. (3 refs.)

102143 Phase relationships for adsorbed layers on surfaces. T.-M.Lu (Dept. of Phys., Rensselaer Polytech. Inst., Troy, NY, USA), M.G.Lagally.
Alloy Phase Diagrams. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.313-26
Ordering phenomena of adsorbed atoms that are commensurate with the substrate structure can be described by a two-dimensional lattice gas. The major features of temperature-coverage phase diagrams for commensurate overlayers are reviewed and illustrated with several experimental examples. For overlayers with net attractive interactions, a two-phase region consisting of ordered overlayer and nearly empty substrate surface forms at low coverage. Substrate extended defects such as steps can create diffusion barriers, thus forming thermodynamic subsystems by eliminating communication between adsorbed atoms on either side of the steps. Steps can also prevent the growth of a reconstructed layer. Experimental examples are presented. (44 refs.)

68.25 MECHANICAL AND ACOUSTICAL PROPERTIES OF SOLID SURFACES AND INTERFACES

(for tribology, see 62.20P and 81.40P)

102144 Experimental study of the Scholte wave propagation on a plane surface partially immersed in a liquid. M.de Billy, G.Quentin (Groupe de Phys. des Solides, Ecole Normale Superieure, Univ. Paris VII, Paris, France).
J. Appl. Phys. (USA), vol.54, no.8, p.4314-22 (Aug. 1983).
This study shows that as a pseudo-Rayleigh wave propagates on the surface of a semi-infinite elastic plane solid, partially immersed in a liquid, a new repartition of the energy appears at the liquid-solid interface. Two interface waves are generated: a generalized Rayleigh wave (or leaky Rayleigh wave) and a Scholte wave (or pseudo-Stoneley). The authors show that for values of the angle of immersion θ_i less than $\theta_{i,m}=\theta_R/2+\pi/4$ (where θ_R is the Rayleigh angle), the amplitude of the Scholte wave depends strongly on the wetting and on θ_i. In this angular region the leaky Rayleigh wave does not disturb the Scholte wave propagation. For $\theta_i>\theta_{i,m}$ the experimental records present an oscillating behavior that the authors have attributed to the superposition of the pseudo-Stoneley wave and the generalized Rayleigh wave specularly reflected by the air-liquid interface. (17 refs.)

102145 Surface acoustic waves in a highly anisotropic film on an isotropic substrate. I.M.Gel'fgat, E.S.Syrkin (Physicotech. Inst. of Low Temperatures, USSR).
Sov. Phys.-Acoust. (USA), vol.29, no.1, p.10-12 (Jan.-Feb. 1983). Translation of: *Akust. Zh. (USSR)*, vol.29, no.1, p.19-22 (Jan.-Feb. 1983).
Surface acoustic waves polarized in the shear and vertical directions are investigated in a layer of a highly anisotropic crystal on an isotropic substrate. The dispersion of the phase and group velocities of these waves is investigated. It is shown that the wave velocity is small for certain orientations of the crystal layer and sufficiently high frequencies. (11 refs.)

102146 Scattering of surface acoustic waves by three-dimensional boundary discontinuities. V.G.Polevoi.
Sov. Phys.-Acoust. (USA), vol.29, no.1, p.52-5 (Jan.-Feb. 1983). Translation of: *Akust. Zh. (USSR)*, vol.29, no.1, p.91-5 (Jan.-Feb. 1983).
The scattering of surface acoustic waves by three-dimensional boundary discontinuities is analyzed in the Born approximation. Expressions are derived for the amplitude of the scattered surface wave and the differential scattering cross section of the discontinuity. (7 refs.)

68.30 DYNAMICS OF SOLID SURFACES AND INTERFACE VIBRATIONS

102147 Anomalous surface phonon dispersion relations for Ag(111) measured by inelastic scattering of He atoms. R.B.Doak (Bell Telephone Labs., Murray Hill, NJ, USA), U.Harten, J.P.Toennies.
Phys. Rev. Lett. (USA), vol.51, no.7, p.578-81 (15 Aug. 1983).
High-resolution time-of-flight measurements of 17-meV He atoms scattered from an Ag(111) surface along the ⟨112⟩ and ⟨110⟩ azimuths are reported. Most of the spectra reveal two sharp peaks and from their locations dispersion curves have been determined out to the zone boundary. The agreement of the lower-frequency mode with the theoretical Rayleigh dispersion curve is excellent. The other mode is significantly lower (35%) than the calculated longitudinally polarized surface mode. (25 refs.)

102148 Vibrational damping of adsorbed molecules: Effects of a realistic metal surface. P.Apell (Phys. Dept., Univ. of Pennsylvania, Philadelphia, PA, USA).
Solid State Commun. (USA), vol.47, no.8, p.615-18 (Aug. 1983).
The damping of a vibrationally excited CO molecule adsorbed on copper can be fully accounted for within an image-dipole interaction provided the effects of nonlocality and particularly a smooth electron density profile of the metal are taken into account. (18 refs.)

102149 Effects of non-locality and surface diffuseness on the electromagnetic response of a vacuum metal interface. P.Apell (Phys. Dept., Univ. of Pennsylvania, Philadelphia, PA, USA).
Solid State Commun. (USA), vol.47, no.8, p.619-22 (Aug. 1983).
A characteristic feature of the response of a metal to an external probe, such as photons or electrons is an induced surface charge. Allowing for a non-local response and a smooth electron density profile in the surface region the classical singular surface charge will relax spatially and the center of gravity of the induced charge will be an important physical quantity characterizing the response. The author proposes a simple analytical interpolation formula for this, having the correct static limit as well as giving a relatively good description of the dynamical response. (13 refs.)

102150 Current state in adsorption from multicomponent solutions of nonelectrolytes on solids. M.Borowko, M.Jaroniec (Dept. of Theoretical Chem., M. Curie-Sklodowska Univ., Lublin, Poland).
Adv. Colloid & Interface Sci. (Netherlands), vol.19, no.1-2, p.137-77 (July 1983).
Surveys the research carried out on the adsorption from multicomponent liquid mixtures of nonelectrolytes on solids with emphasis on the work performed by the authors. The consistent theoretical treatment of adsorption from concentrated and dilute multicomponent solutions and its application to the liquid adsorption chromatography with the mixed mobile phase are presented. This treatment involves nonideality of the bulk and surface phases, energetic heterogeneity of the adsorbent surface and it may be extended to multilayer adsorption from solutions. (144 refs.)

102151 Study of the structure of a $c(2\times2)$ overlayer of carbon monoxide on Co (001) by LEED intensity measurements. M.Maglietta (Facolta di Ingegneria, Univ. di Firenze, Firenze, Italy).
Appl. Phys. A (Germany), vol.A31, no.3, p.165-70 (July 1983).
Cross-comparison of experimental LEED intensity spectra from Co $(001)c(2\times2)$-CO with both experimental and theoretical data from Ni $(001)c(2\times2)$-CO for the same beams at normal incidence indicates that CO is chemisorbed at the same sites and in the same position in the two cases. As a secondary goal, the effect of the LEED primary beam was also investigated and found to induce different structural modifications, with respect to those observed in the case of nickel. (14 refs.)

102152 Adsorption of cycloalkane and cyclopentanealkyl acids at the air/water interface. J.J.Spitzer, L.D.Heerze (Dept. of Chem., Univ. of Lethbridge, Lethbridge, Alberta, Canada).
Can. J. Chem. (Canada), vol.61, no.6, p.1067-70 (June 1983).
Surface tensions of aqueous solutions of cyclopropane, cyclobutane, cyclopentane, and cycloheptane carboxylic acids, and of cyclopentaneacetic and cyclopentanepropionic acids were measured at 25°C by the drop volume method. The Traube constants for calculation of standard free energies of absorption were estimated from second and third degree polynomial least-squares analyses, from nonlinear least-squares analysis using the Szyszkowsky equation, and graphically. The standard free energies of adsorption at the air/solution interface of cycloalkane and cycloalkanealkyl carboxylic acids are less negative than those of the corresponding straight chain acids, but not by a constant amount; the standard free energy of the CH_2 group in a cycloalkane ring is -2.5 kJ mol^{-1} as compared to a value of -3.3 kJ mol^{-1} for straight chain acids. (12 refs.)

102153 The adsorption of hydrocarbons on silicalite and ZSM5. U.Lohse, B.Fahlke (Akad. der Wissenschaften, Berlin, Germany).
Chem. Tech. (Germany), vol.35, no.7, p.350-3 (July 1983). In German.
The adsorption of in-hexane, benzene and p-xylene on silicalite and ZSM5 has been investigated by isotherm measurements. The adsorption isotherms exhibit a plateau located at half of the saturation capacity which is more pronounced at increased temperature. For the adsorption system benzene—silicalite a hysteresis loop in the isotherms and an unusual dependence of the heat of adsorption on the number of adsorbed molecules are observed. The results are discussed with respect to the geometrical factors within the narrow channel system of silicalite and ZSM5. (21 refs.)

102154 Deactivation of singlet oxygen $O_2^*(^1\Delta_g)$ on gold surfaces. M.E.Ryskin, B.R.Shub (Inst. of Chem. Phys., Acad. of Sci., Moscow, USSR), J.Pavlicek, Z.Knor.
Chem. Phys. Lett. (Netherlands), vol.99, no.2, p.140-3 (29 July 1983).
The deactivation of singlet oxygen $O_2^*(^1\Delta_g)$ on a gold surface and its change due to temperature variation and water vapour addition have been investigated in a flow system. (17 refs.)

102155 Properties of thermally modified controlled porous glasses (CPG). II. Study of CPG surface properties by means of adsorption heat measurements. A.L.Dawidowicz, I.Choma, A.Patrykiejew, K.Pilorz (Dept. of Chem. Phys., Maria Curie Sklodovska Univ., Lublin, Poland).
Mater. Chem. & Phys. (Switzerland), vol.8, no.6, p.531-40 (June 1983).
For pt.I see ibid., vol.8, no.4, p.323-36 (1983). The properties of thermally modified CPG have been studied by means of gas chromatography. The isosteric heat adsorption for hexane, benzene, chloroform and diethylether adsorbed on CPG surfaces of different boron concentration were determined. It was found that the heating of CPG causes (a) dehydroxylation of the surface (b) a gradual increase of the boron concentration in the surface region, and (c) formation of borate crystals on the glass surface. (11 refs.)

102156 Multicritical behavior of polymers near an adsorbing wall. E.Eisenriegler (Inst. fur Festkorperforschung, KFA Julich, Julich, Germany).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.697-702 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
Due to possible technological and biological applications, the statistical mechanics of polymer adsorption has been of longstanding interest. Recently, the problem has been reconsidered both numerically and analytically. This was stimulated mainly by recent advances in the field theory of semi-infinite spin systems. The author presents some of these recent results both for a single long chain with excluded-volume interaction and for semidilute solutions in good solvent near an adsorbing wall (or surface). As for other critical phenomena the behavior near the adsorption temperature is independent of most details ('universality') and one may discuss simple models. (11 refs.)

102157 Molecular dynamics simulations of phase transitions in physisorbed nobel gases. S.W.Koch, F.F.Abraham (IBM Res. Lab., San Jose, CA, USA).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.755-64 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
The freezing transition of xenon on graphite and the commensurate-incommensurate transition of krypton on graphite are studied by molecular-dynamics computer simulations. The results are shown to be in good agreement with recent X-ray scattering experiments of these systems. The simulations lead to valuable physical insights into the detailed nature of the investigated phase transitions. (14 refs.)

102158 The influence of the addition of MgO on the surface mass transport of alumina. C.Monty, J.Le Duigou (CNRS Lab. de Phys. des Materiaux, Meudon, France).
High Temp.-High Pressures (GB), vol.14, no.6, p.709-16 (1982). [received: June 1983] (International Conference on Chemistry of Materials at High Temperatures, Harwell, Oxon., England, 7-10 Sept. 1981).
The influence of MgO additions on the sintering of Al_2O_3 is a well known but not well understood phenomenon. It has been suggested that the enhancement of surface diffusivity permits sintering to full density. A series of experiments was performed to measure the surface mass transport by following the decay of periodic gratings on basal planes of pure alumina and MgO-doped alumina (21 ppm). Annealing was performed under air, at 1650°C and 1700°C. It was found that the rate of surface mass transport is decreased by the addition of MgO. The kinetics of matter transport of pure alumina under air and under argon are faster than under vacuum. This shows a contribution of vapour phase transport in dense atmospheres. (21 refs.)

102159 The electronic structure of aromatic molecules adsorbed on Pd (111). F.P.Netzer, J.U.Mack (Inst. fur Phys. Chem., Univ. Innsbruck, Innsbruck, Austria).
J. Chem. Phys. (USA), vol.79, no.2, p.1017-25 (15 July 1983).
Angle resolved ultraviolet photoelectron spectroscopy (ARUPS) and electron energy loss spectroscopy (ELS) have been used to study the electronic energy level structure of aromatic molecules such as benzene, *m*-xylene, pyridine, and 2,6-dimethylpyridine adsorbed on Pd (111) at room temperature. Angle resolved He I and He II spectra were investigated to assign adsorbate derived bands in terms of molecular orbitals of the gas-phase molecules, whereby He II radiation proved particularly useful for this assignment because deeper lying σ orbitals can be observed. Angle resolved photoemission behaviour of benzene is satisfactorily described by an adsorbate complex of C_{6v} symmetry, i.e. consisting of benzene molecules with their ring plane parallel to the surface. It appears that the geometrical structure of the surface does not greatly influence the symmetry properties of the surface molecule. Reduction of the free-molecule symmetry C_{2v} to C_s in the adsorbed state is necessary for *m*-xylene, pyridine, and dimethylpyridine to account for the relaxation of symmetry based restrictions in normal emission. This can be interpreted for *m*-xylene and dimethylpyridine in terms of adsorption parallel to the surface, but for pyridine an adsorbate phase of molecules in an inclined geometry, with their molecular plane tilted with respect to the surface, is proposed. The initial state information of UPS is used to discuss the electronic excitation spectra of aromatic molecules on Pd (111). The intramolecular $\pi\rightarrow\pi^*$ excitations of the free molecules are not clearly observed in ELS of the adsorbed molecules, but strong charge transfer bands are seen in the loss energy region 2.5-5 eV. Possible reasons for the absence of distinct intramolecular features in adsorbate ELS are discussed. These include pronounced modifications of the π orbital structure for strong adsorbate-surface interaction, reduction of transition probabilities due to the dielectric response of the substrate, and interference of the molecular transition with surface plasmon excitation. (34 refs.)

102160 The influence of steps on the desorption kinetics of NO from Pt(111). J.A.Serri, J.C.Tully, M.J.Cardillo (Bell Labs., Murray Hill, NJ, USA).
J. Chem. Phys. (USA), vol.79, no.3, p.1530-40 (1 Aug. 1983).
A kinetic model is presented which describes thermal desorption of molecules from surfaces and incorporates trapping at steps. The model is applied to desorption of NO from Pt(111). The results of three molecular beam experiments, which differ substantially from each other, are accounted for quantitatively by the model using one set of rate parameters. It is demonstrated that steps, even when present in small concentrations on accurately cut crystals, can play a dominant role in thermal desorption. The magnitude of the effect depends on the difference between the binding energies on the terrace and at steps, which for NO on Pt(111) is large (25 ± 2 kcal/mol and 34 ± 2 kcal/mol, respectively). Furthermore, it is shown that the rate parameters governing terrace desorption, escape from steps, and surface diffusion can all be extracted from modulated molecular beam studies carried out for a suitable range of conditions. (13 refs.)

102161 Inert-gas energy-accommodation coefficients on tungsten. S.F.Borisov, Yu.G.Semenov, P.E.Suetin (Gor'kii Urals Univ., Sverdlovsk, USSR).
J. Eng. Phys. (USA), vol.43, no.6, p.1394-8 (Dec. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.6, p.983-8 (Dec. 1982).
Measurements have been made of the energy-accommodation coefficiencts for inert gases on the thermally cleaned and partially controllable surface of tungsten at about 300K under conditions of oil-free pumping. (12 refs.)

102162 Adsorption layers of surface-active substances and their influence on polyurethane network formation. T.E.Lipatova, Sh.G.Vengerovskaya, A.E.Feinerman, L.S.Sheinina (Inst. of Organic Chem., Acad. of Sci., Kiev, Ukrainian SSR).
J. Polym. Sci. Polym. Chem. Ed. (USA), vol.21, no.7, p.2085-94 (July 1983).
The study of polyurethane systems in the presence of surface-active substances (SASs) proves that surfactants cause structural and kinetic changes in the reaction system. Surfactant decreases the viscosity of these systems in the early stages of reaction, shifting the beginning of structural gel formation to the higher degrees of NCO-group conversion. The reaction rate is a complex function of surfactant concentration. The binary polyether-surfactant system was studied by IR spectroscopy and surface tension measurement. The data prove that intermolecular and intramolecular H bonds in the system are redistributed at all surfactant concentrations but 0.03 and 0.15%. According to the authors calculations for surfactant adsorption layers at the polyether-air interface, ΔS values do not depend on temperature at surfactant concentration 0.03%; whereas at 0.15% ΔS and ΔH values are maximum. The results obtained by different methods are well correlated and suggest that kinetic effects are due to redistribution of H bonds under the influence of conformational changes in surfactant structure. (19 refs.)

102163 Theory of the long range polarization of an adatom near a solid surface. L.Galatry, D.Girard (Lab. de Phys. Moleculaire, Univ. de Besancon, Besancon, France).
Mol. Phys. (GB), vol.49, no.5, p.1085-101 (10 Aug. 1983).
The electric polarization of an adatom near a solid surface is studied in the absence of electron overlap. This polarization is formulated in the frame of the non-linear (electro-optical) effect. It exhibits a dependence with respect to the dielectric constant of the solid and to a quadratic hyperpolarizability of the atom. The result is then shown to be consistent with other formulations of the same effect, presently available in the literature. (24 refs.)

102164 Heat of adsorption of water on E glass fibre surfaces. M.Akinc, D.M.Martin (Materials Sci. & Engng., Iowa State Univ., Ames, IA, USA).
Phys. & Chem. Glasses (GB), vol.25, no.5, p.117-21 (Oct. 1983).
E glass fibres were prepared by drawing into atmospheres containing water vapour and tetrafluoromethane (CF_4). After suitable conditioning, the heat of adsorption of the water vapour in the monolayer and multilayer regimes was determined using adsorption isotherms. Adsorption of water vapour on fibre drawn in humid atmospheres was exothermic, as expected, while strongly endothermic adsorption was observed on fibres drawn in atmospheres containing CF_4. Fluorinated fibres became hydrophobic on exposure to benzene vapour, due to the irreversible nature of the adsorption of benzene. (12 refs.)

102165 Neutron diffraction from ethylene adsorbed on graphite. S.K.Satija, L.Passell, J.Eckert, W.Ellenson (Brookhaven Nat. Lab., Upton, NY, USA), H.Patterson.
Phys. Rev. Lett. (USA), vol.51, no.5, p.411-14 (1 Aug. 1983).
A neutron-diffraction study of deuterated-ethylene overlayers on graphite basal planes reveals the existence of three distinct adsorbed solid phases as well as the coexistence of adsorbed and bulk phases at higher coverages. Evidence of a surface wetting transition involving transfer of molecules from the bulk to adsorbed phase is also obtained. (8 refs.)

102166 Comment on 'Observation of resonant photoemission in an adsorbed molecule'. J.A.D.Matthew (Dept. of Phys., Univ. of York, York, England), D.E.Ramaker, E.Bertel, M.A.Chesters.
Phys. Rev. Lett. (USA), vol.51, no.6, p.521 (8 Aug. 1983).
Loubriel et al. (see ibid., vol.49, p.571, 1982) have recently reported resonantly enhanced photoemission data for CO chemisorbed on Pt(111). The authors compare this data with existing electron-excited Auger data on the same system, and present modifications to their interpretation as suggested by this comparison. (5 refs.)

102167 Melting and wetting behavior in oxygen films. D.D.Awschalom, G.N.Lewis, S.Gregory (Lab. of Atomic & Solid State Phys., Cornell Univ., Ithaca, NY, USA).
Phys. Rev. Lett. (USA), vol.51, no.7, p.586-8 (15 Aug. 1983).
At high coverages and low temperatures oxygen on exfoliated graphite takes the form of a bilayer film plus bulk solid clusters. A transition at 47K is interpreted as prewetting in which a thick film is formed. Evidence for this transition is seen in heat-capacity and magnetic-susceptibility measurements. (7 refs.)

102168 Static dipole moment of an atom or a centrosymmetric molecule near a perfect metallic surface. P.Grossel (Lab. d'Optique, Univ. de Reims, Reims, France), J.M.Vigoureux, D.Van Labeke.
Phys. Rev. A (USA), vol.28, no.2, p.524-31 (Aug. 1983).
The expression for the dipole moment of an atom or a centrosymmetric molecule in the vicinity of a perfect metallic surface is given at any distance. The near-zone (London) and the far-zone (Casimir) limits of these results are also considered. (28 refs.)

102169 Coupling of phonons to a helium atom adsorbed on graphite. R.D.Williams, M.W.Cole, S.E.Koonin (California Inst. of Technol., Pasadena, CA, USA).
Phys. Rev. B (USA), vol.28, no.2, p.1076-80 (15 July 1983).
The authors compute the self-energy for a ^4He atom adsorbed on graphite to second order in the phonon coupling. The phonon contributions amount to several degrees Kelvin. The imaginary part corresponds to a lifetime of some 10^{-11} s. (23 refs.)

102170 Ion desorption from surfaces following photon excitation of core electrons in the bulk. R.Jaeger, J.Stohr (Corporate Res. Sci. Labs., Exxon Res. & Engng. Co., Linden, NJ, USA), T.Kendelewicz.
Phys. Rev. B (USA), vol.28, no.2, p.1145-7 (15 July 1983).
Comparison of photon-excited total electron yield and H^+-ion yield spectra above the N *K* edge and Ni *L* edge for single and multiple NH_3 layers on Ni (110) reveal the dominance of an indirect ion-desorption mechanism. This mechanism consists of photon excitation in the bulk with long-range transfer of the excitation to the surface by secondary electrons. The results imply important limitations in the existing picture of the electron- and photon-stimulated-desorption techniques as site-specific, local surface probes. (10 refs.)

102171 Chemisorption on CO of Co(0001). II. Multielectron excitations. H.-J.Freund (Lehrstuhl fur Theoretische Chem., Univ. zu Koln, Koln, Germany), F.Greuter, D.Heskett, E.W.Plummer.
Phys. Rev. B (USA), vol.28, no.4, p.1727-33 (15 Aug. 1983).
For pt.I see ibid., vol.27, p.7117 (1983). The outer valence levels of CO chemisorbed on Co(0001) have been studied and discussed in a previous paper. In this paper the authors compare the photoionization of all core and valence levels for an adsorbate system [CO-Co(0001)] to those of a corresponding metal-molecule cluster $[Co_4(CO)_{12}]$. The observed multielectron excitations accompanying these molecular ionizations are discussed in detail. The observation of a resonance in the valence-band satellite of bulk cobalt is also described. (30 refs.)

102172 Theoretical studies of chemisorbed oxygen on Ag(110). R.L.Martin, P.J.Hay (Theoretical Div., Los Alamos Nat. Lab., Los Alamos, NM, USA).
Surf. Sci. (Netherlands), vol.130, no.1, p.L283-8 (July 1983).
The interaction of an oxygen atom with a 26-atom cluster model of the (110) face of Ag has been investigated with ab initio self-consistent-field and configuration-interaction theory. The SCF results for the bridge site (C_{2v}) predict r=0.3 Å and ω_e=327 cm^{-1}, in good agreement with the available experimental evidence. The calculated binding energy (D_e=9 kcal/mole) is roughly an order of magnitude too small. The inclusion of electron correlation increases r_e and ω_e only slightly, but should have a dramatic effect on D_e. The ground state corresponds to a 'surface oxide' state. The theoretical projected density-of-states curves exhibit 'bonding' and 'anti-bonding' O(2p) peaks, separated by ~6 eV, in good agreement with recent angle-resolved photoemission data. (17 refs.)

102173 Thermal desorption of N_2 from (N_2+O_2) coadsorbed on polycrystalline rhenium surfaces. T.Kioka, H.Miki, K.Kawasaki (Dept. of Phys., Sci. Univ. of Tokyo, Chiba, Tokyo, Japan).
Surf. Sci. (Netherlands), vol.130, no.1, p.L294-8 (July 1983).
The coadsorption of $^{15}N_2$ and O_2 on polycrystalline rhenium filament has been studied by thermal desorption mass spectroscopy. The sample was exposed to a mixture of $^{15}N_2$ and O_2 with various concentrations of $^{15}N_2$ at room temperature. It is suggested that NO on Re at low coverage is dissociative and the bonding strength of nitrogen on Re is weakened by the coadsorption with oxygen atoms. (12 refs.)

102174 Study of Ag/Si(111) submonolayer interface. II. Atomic geometry of Si(111) ($\sqrt{3}\times\sqrt{3}$)R30°-Ag surface. S.Kono, H.Sakurai, K.Higashiyama, T.Sagawa (Dept. of Phys., Tohoku Univ., Sendai, Japan).
Surf. Sci. (Netherlands), vol.130, no.1, p.L299-306 (July 1983).
For pt.I see ibid., vol.127, no.1, p.35-47 (1983). Final state diffraction of Ag 3d X-ray photoelectrons from the Si(111) ($\sqrt{3}\times\sqrt{3}$)R30°-Ag surface has been measured. From a kinematical analysis of the diffraction patterns, it is found that a buried honeycomb framework of Ag atoms is formed on the surface with lateral displacement of the first Si layer. (17 refs.)

102175 The adsorption of cyclic hydrocarbons on Ru(001). I. Cyclopropane. T.E.Felter, F.M.Hoffmann, P.A.Thiel, W.H.Weinberg (Dept. of Chem., California Inst. of Technol., Pasadena, CA, USA).
Surf. Sci. (Netherlands), vol.130, no.1, p.163-72 (July 1983).
The adsorption of cyclopropane on Ru(001) at 90K has been investigated by high-resolution electron energy loss spectroscopy, He I photoelectron spectroscopy, low-energy electron diffraction and thermal desorption mass spectrometry. The results indicate that the molecule adsorbs nondissociatively without long-range order and that no opening of the carbon ring occurs. The adsorption bond is weak, and multilayers form at 90K only in the presence of a relatively high c-C_3H_6 equilibrium pressure. The vibrational spectrum is characterized by strong, dipole-active ring deformation modes and an additional mode at 570 cm^{-1}, which is due to a frustrated translation of the admolecule perpendicular to the surface with some ring deformation character. The photoelectron spectrum is characterized by a Jahn-Teller splitting of the 3e′ molecular orbital, which is observed also in the gas phase. With the exception of a uniform relaxation shift no other shifts could be observed in comparison with the gas phase. The results are discussed in relation to possible bonding mechanisms. (26 refs.)

102176 The adsorption of cyclic hydrocarbons on Ru(001). II. Cyclohexane. F.M.Hoffmann, T.E.Felter, P.A.Thiel, W.H.Weinberg (Div. of Chem., California Inst. of Technol., Pasadena, CA, USA).
Surf. Sci. (Netherlands), vol.130, no.1, p.173-90 (July 1983).
For pt.I see ibid., vol.130, p.163 (1983). The adsorption of cyclohexane on Ru(001) at 90K has been investigated by thermal desorption mass spectrometry, EELS, UV photoemission and LEED. Thermal desorption indicates the adsorption of the undissociated molecule first in a chemisorbed monolayer (T_d=200K) with subsequent formation of multilayers (T_d=165K) at higher exposures. The vibrational spectrum obtained by EELS is characterized by a frequency shift of the C-H stretching mode from 2920 cm^{-1} (mutilayer) to 2560 cm^{-1} for the chemisorbed monolayer. Off-specular EELS data indicate two different electron scattering mechanisms for the C-H stretching mode. Whereas for the C-H stretching mode of the multilayer, large angle electron impact scattering is observed, the C-H soft-mode of the monolayer is largely due to small angle dipolar scattering. The He I photoelectron spectra of cyclohexane multilayers are characteristic of the undissociated molecule. A new assignment of C(2s) and the lowest C(2p) level, based on a comparison with benzene, shows that the chemisorbed monolayer is characterized by the absence of emission or broadening of the $2a_{1u}$ level. This is attributed to C_{3v} symmetry of the chemisorbed layer and to a possible interaction of the $2a_{1u}$ orbital with the metal surface. (44 refs.)

102177 Investigation of surface self-diffusion of Ni atoms on the Ni(100) plane by means of work function measurements and Monte Carlo calculations. P.Schrammen, J.Holzl (Fachbereich Phys., Univ. des Landes Hessen, Kassel, Germany).
Surf. Sci. (Netherlands), vol.130, no.1, p.203-28 (July 1983).
A novel method is presented to study migration of adsorbed metal atoms on a clean (*hkl*) surface of a metal substrate. The system used was Ni on Ni(100). The authors make use of the assumption that each single step of random walk motion of an individual adatom on the metal substrate refers to an activation energy ΔE_{if} (indices i and f giving the number of occupied nearest neighour sites in the initial and final position respectively). Furthermore, they assume that the dipole moment p_ν of an adatom is determined by the number ν of occupied nearest neighour sites. Via their dipole moments the adsorbed atoms induce a change of work function $\Delta\Phi$ of the substrate metal, $\Delta\Phi$ being related to the average dipole moment per unit area by the Helmholtz equation. To measure $\Delta\Phi$ they use a pendulum device. At fixed low coverage θ the variation of $\Delta\Phi$ with temperature T has been calculated numerically within the framework of a Monte Carlo simulation (MCS) model, using various activation energies ΔE_{if} and dipole moments p_ν as input parameters. By fitting these data to the experimental curves the authors derive the following dipole moments and activation energies: $p_0=0.45\pm0.05$ D, $p_1=0.36\pm0.05$ D, $p_2=0.27\pm0.05$ D, $p_3=0.18\pm0.05$ D, $\Delta E_{00}=0.60\pm0.02$ eV, $\Delta E_{10}=0.70\pm0.025$ eV, $\Delta E_{21}=0.80\pm0.05$ eV, $\Delta E_{20}=0.90\pm0.05$ eV. They compare these results with those of other workers. (17 refs.)

102178 Adsorption of coumarin on faces of a bismuth single crystal. N.A.Paltusova, A.R.Alumaa, U.V.Palm.
Sov. Electrochem. (USA), vol.18, no.11, p.1380-4 (Nov. 1982). Translation of: *Elektrokhimiya (USSR)*, vol.18, no.11, p.1546-50 (Nov. 1982).
The results of capacitance measurements have led to the conclusion that coumarin molecules are adsorbed on mercury and on bismuth in two different orientations: in a vertical orientation at high negative charges and in an inclined orientation near the p.z.c. At the same time, the plots of the differential capacitance on a fixed bismuth electrode differ qualitatively from the C, E curves on mercury, i.e. on bismuth there is no intermediate capacitance maximum between the two absorption regions. Therefore, the study of the laws governing the adsorption of coumarin on the individual faces of a bismuth single crystal is of considerable interest. (7 refs.)

102179 Adsorption of cyanide ions on silver. Effect of electrode potential and surface coverage by adsorbed ions on the adsorption-desorption equilibrium rate. N.A.Rogozhnikov, R.Yu.Bek.
Sov. Electrochem. (USA), vol.18, no.11, p.1394-7 (Nov. 1982). Translation of: *Elektrokhimiya (USSR)*, vol.18, no.11, p.1561-3 (Nov. 1982).
A study of the relationship between the adsorption-desorption equilibrium rate (ν_0) and the surface density of an adsorbed substance (A) as well as the electrode potential (E) can be used to determine how these factors affect the forward and reverse processes. The following expression for resistance (R_{11}) includes the term ν_0: $R_{11}=RT/(\partial q/\partial A)E^2\nu_0$ where R is the universal gas constant, T is the absolute temperature, and q is the electrode charge. The R_{11} values were determined from the relation of frequency to capacitance

using a substitution procedure similar to that for single-step adsorption whose laws also govern the effect under study. (7 refs.)

102180 Phase transitions in adsorbed layers. IV. Thermodynamics of monolayer adsorption. A.Patrykiejew (Dept. of Chem. Phys., Marie Curie-Sklodowska Univ., Lublin, Poland).
Thin Solid Films (Switzerland), vol.105, no.3, p.259-83 (22 July 1983).
For pt.III see ibid., vol.88, p.359 (1982). The effects of dimensional incompatibility and of potential barriers for surface diffusion on the phase transitions in a monolayer are discussed in terms of the partially mobile adsorption layer model presented in the previous publication. It is pointed out that the formation of a two-dimensional solid phase with the adsorbent can be either discontinuous (first order) or continuous depending on the properties of the adsorption system. In particular, the first-order transition from the liquid to the solid phase can occur only when the system exhibits small dimensional incompatibility. The changes in various thermodynamic functions for the monolayer (e.g. the isosteric heat of adsorption, the differential entropy and the heat capacity) due to phase transitions are discussed. (25 refs.)

102181 Studies of photon induced gas desorption using synchrotron radiation. O.Grobner, A.G.Mathewson, H.Stori, P.Strubin (CERN, Geneva, Switzerland), R.Souchet.
Vacuum (GB), vol.33, no.7, p.397-406 (July 1983).
In view of finalizing the design of the vacuum system of the Large Electron and Positron Storage Ring (LEP), the authors have studied synchrotron radiation induced neutral gas desorption. A 3 m section of an aluminium vacuum chamber has been exposed to the photon beam emerging from the electron storage ring DCI in Orsay, under conditions closely simulating the environment in a particular accelerator. In order of importance the gases desorbed were H_2, CO_2,CO and CH_4 with H_2O practically absent. Under the experimental conditions of an unbaked chamber and 11 mrad glancing incidence of the photons, the initial molecular desorption yields for these gases were typically 0.5, 8×10^{-2}, 2×10^{-2} and 8×10^{-3} molecules per photon respectively. These values could be reduced by about 1 to 2 orders of magnitude during continued photon exposure and in most cases without evidence that this 'beam cleaning action' would be limited. After exposure to air and pumpdown of the previously cleaned chamber, a significant memory effect was observed. The dependence of the photon desorption on the angle of incidence has been studied down to a glancing angle of 11 mrad showing a definite deviation from the previously assumed $1/\sin\phi$ scaling. The implications of the results in terms of the expected beam-gas lifetimes in LEP are discussed. (7 refs.)

102182 Analysis of laser-enhanced adsorption/desorption processes on semiconductor surfaces via electronic surface state excitation. W.C.Murphy, A.C.Beri, T.F.George (Dept. of Chem., Univ. of Rochester, Rochester, NY, USA), J.-T.Lin.
Laser Diagnostics and Photochemical Processing for Semiconductor Devices. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.273-82
Electronic surface states in semiconductors often lie between the valence and conduction bands and give rise to charge densities confined to the surface region. Laser radiation of frequency less than the energy gap can excite electrons from delocalized valence band states to these localized surface states leading to large changes in the charge distribution at the surface. Selective enhancement of adsorption/desorption processes involving ionic or polar adspecies can result from such a charge redistribution. Using a one-dimensional model for silicon, the cross-section for the laser-induced electronic transition to surface states is shown to be large. The interaction energy of an adspecies with the surface changes significantly with direct excitation of surface states in a semiconductor. For a one-dimensional metal, however, direct transitions between bulk and surface states are not allowed, but phonon-mediated transitions coupled with laser radiation lead to substantial charge transfer as for semiconductors. 68.48 SOLID-SOLID INTERFACES

(inc. bicrystals; for grain boundaries, see 61.70N)

102183 Metal-semiconductor interface formation. D.Bolmont (Lab. de Phys. des Solides, Univ. Pierre et Marie Curie, Paris, France).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.483-92 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
The more and more detailed study of an increasing number of metal-semiconductor (MS) interfaces tends to demonstrate the prevailing part played by the different local bonds associated with the compositional change at the interface. In the case of the abrupt interfaces both geometrical properties and electronic equilibrium are settled at a coverage below one monolayer. A few cases are discussed which show the variety of physical phenomena involved in the barrier height fixation in contradiction with all attempts to a unified model. (11 refs.)

102184 Electron microscope studies of a Ge-GaAs superlattice grown by molecular beam epitaxy. T.S.Kuan, C.-A.Chang (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA).
J. Appl. Phys. (USA), vol.54, no.8, p.4408-13 (Aug. 1983).
A Ge-GaAs superlattice with individual layer thicknesses of 10 nm (Ge layers) and 8 nm (GaAs layers) grown on a (100) oriented GaAs substrate at 400°C by molecular beam epitaxy was examined by transmission electron microscopy. Cross-sectional lattice images of the superlattice revealed no lattice irregularities in both GaAs and Ge layers and perfect lattice match at the Ge-GaAs interfaces. However, bright field and dark field images of the same superlattice indicated the presence of planar defects in the GaAs layers but not in the Ge layers. These planar defects, whose nature does not involve perturbations of the crystal lattice other than elastic strain fields, are most likely antiphase boundaries, which are generated during the growth of the GaAs layers by the coalescence of GaAs domains independently grown on the Ge surface. The generation of antiphase boundaries in GaAs layers might be responsible for the segregated Ge and GaAs columnar structure previously observed in Ge-GaAs superlattices with individual layer thicknesses of only a few monolayers. (12 refs.)

102185 Grain boundary strength of molybdenum bicrystals with a $\langle 110\rangle$ twist boundary. H.Kurishita (Dept. of Materials Sci. & Technol., Kyushu Univ., Fukuoka, Japan), S.Kuba, H.Kubo, H.Yoshinaga.
J. Jpn. Inst. Met. (Japan), vol.47, no.7, p.539-45 (July 1983). In Japanese.
Grain boundary fracture in molybdenum was investigated by the four-point bending test at 77K as a function of misorientation angle by using bicrystals with a $\langle 110\rangle$ twist boundary. It was found that fracture always occurs at the grain boundary. The fracture strength and strain to fracture markedly depend on the misorientation angle, i.e. the bicrystals of misorientation up to 20° and those of around 70° (Σ^3) have much higher fracture strength than the others, and some appreciable plastic strain is only observed for these strong bicrystals. Misorientation width of the peak in strength agrees with the predicted value from the Brandon's equation. There are no peaks in strength around Σ^9 and Σ^{11} coincidence boundaries. (21 refs.)

102186 Grain boundary fracture in molybdenum bicrystals with a $\langle 110\rangle$ symmetric tilt boundary. H.Kurishita (Dept. of Materials Sci. & Technol., Kyushu Univ., Fukuoka, Japan), A.Oishi, H.Kubo, H.Yoshinaga.
J. Jpn. Inst. Met. (Japan), vol.47, no.7, p.546-54 (July 1983). In Japanese.
In order to investigate the grain boundary fracture in molybdenum with a $\langle 110\rangle$ symmetric tilt boundary, the four-point bending test was conducted at 77K by using bicrystals with various misorientations from 0° to 90°. The stress-strain curve to fracture was measured as a function of misorientation angle ϕ. Two classes of specimens were used to clarify the impurity effect on the grain boundary fracture: one was as-grown specimens which contained carbide precipitates at grain boundaries and the other was purified specimens in which no precipitates were observed. A marked misorientation dependence of both fracture stress and plastic strain to fracture, was observed for the purified specimens; the stress and strain were both much higher for $\phi=0°$-10° (Σ^1), around 70° (Σ^3, (112) twin boundary) and around 87° (Σ^{17b}, (223) twin boundary) than for the other boundaries. The dependence observed for the as-grown specimens was qualitatively similar to but quantitatively much less than that for the purified specimens. The misorientation dependence of the grain boundary energy and the effect of carbon impurity on the grain boundary cohesion were discussed. (21 refs.)

102187 Evidence for grain boundary phase transition in a 2D bicrystal. F.Carrion, G.Kalonji, S.Yip (Dept. of Nuclear Engng., MIT, Cambridge, MA, USA).
Scr. Metall. (USA), vol.17, no.7, p.915-18 (July 1983).
Molecular dynamics simulation results are presented on a two-dimensional bicrystal which reveal a structural transition at a temperature approximately between 0.7 T_m to 0.8 T_m. The evidence lies mainly in a discontinuous behavior in the temperature variations of thermodynamic properties of a two-dimensional $\Sigma=7$ (38.21°) bicrystal in which the atoms interact through a Lennard-Jones 6-12 potential. Additional results in the form of instantaneous atomic configurations at various stages of the simulation support this interpretation. (16 refs.)

68.55 THIN FILM GROWTH, STRUCTURE, AND EPITAXY

(for techniques of crystal growth and film deposition, see 81.10 and 81.15)

102188 Epitaxial $NiSi_2$ formation by pulsed laser irradiation of thin Ni layers deposited on Si substrates. M.G.Grimaldi, P.Baeri, E.Rimini (Istituto Dipartimentale di Fisica, Cătania, Italy), G.Celotti.
Appl. Phys. Lett. (USA), vol.43, no.3, p.244-6 (1 Aug. 1983).
Pulsed laser irradiation was used to induce silicide formation in Ni thin layer deposited onto Si substrates of ⟨100⟩ and ⟨111⟩ orientation, respectively. Suitable energy densities of the 30-ns Nd glass laser pulse produced epitaxial $NiSi_2$ silicide for a 15-nm-thick Ni layer. Irradiation of thicker metal films formed instead several silicides of nonuniform composition. (11 refs.)

102189 Growth of metastable $Cu_{1-x}Cr_x$ solid solutions by ion mixing during bias-sputter deposition. S.M.Shin, M.A.Ray, J.M.Rigsbee, J.E.Greene (Dept. of Metall., Univ. of Illinois, Urbana, IL, USA).
Appl. Phys. Lett. (USA), vol.43, no.3, p.249-51 (1 Aug. 1983).
The Cu-Cr system exhibits a miscibility gap in the liquid and has essentially no solid solubility. However, using low energy, <160 eV, Ar^+ ion bombardment of the growing film to promote ballistic collisional mixing, metastable single phase face-centered-cubic Cu-rich and body-centered-cubic Cr-rich solid solutions have been grown on amorphous glass substrates at 75°C. The films were typically 1 μm thick with average grain sizes of 90 and 110 nm, respectively, and a (111) preferred orientation. Annealing studies combined with X-ray and electron diffraction analyses showed that the films have good thermal stability against phase separation at temperatures up to 400°C. The metastable to equilibrium phase transformation occurred with the precipitation of an essentially pure second phase, rather than through a continuous series of metastable states, due to structural constraints. (8 refs.)

102190 Epitaxial growth of $Hg_{0.7}Cd_{0.3}Te$ by laser-assisted deposition. J.T.Cheung (Rockwell Internat. Sci. Center, Thousand Oaks, CA, USA).
Appl. Phys. Lett. (USA), vol.43, no.3, p.255-7 (1 Aug. 1983).
Epitaxial *n*-type $Hg_{0.7}Cd_{0.3}Te$ layers on (111)A CdTe substrates have been grown at 130°C by laser-assisted deposition. Mobility and carrier concentration values at 77K range from 4000 to 7000 cm^2/Vs and 0.7 to 3×10^{16} cm^{-3}, respectively. Films can be converted to *p* type after annealing at 410°C. Implanted n^+/p photodiodes have been demonstrated. (6 refs.)

102191 Epitaxial film transfer technique for producing single crystal Si film on an insulating substrate. M.Kimura, K.Egami, M.Kanamori (Fundamental Res. Labs., NEC Corp., Kawasaki, Japan), T.Hamaguchi.
Appl. Phys. Lett. (USA), vol.43, no.3, p.263-5 (1 Aug. 1983).
Epitaxial film transfer, a new technique for producing a single crystal Si film with both large size and high quality on an insulating substrate, is demonstrated. The technique in which an epitaxial Si film is transferred to a secondary substrate by using three fundamental processes of epitaxial growth, bonding of two wafers, and substrate elimination, can produce a 2-in. single crystal Si film as thin as 1.5 μm on an insulating substrate. Thickness variation can be controlled to ±0.06 μm across a 2-in. wafer. An epitaxial Si film is transferred without significant degradation in quality although a fine film waving exists. (6 refs.)

102192 Temperature and concentration dependence of epitaxial growth rate in Sb and Ga implanted Si. S.U.Campisano, Chu Te Chang (Istituto Dipartimentale di Fisica, Catania Univ., Catania, Italy).
Appl. Phys. A (Germany), vol.A31, no.3, p.157-60 (July 1983).
The epitaxial growth rate of SI (100) implanted with several doses of Sb or Ga has been measured at 480 and 500°C by channeling-effect technique. The growth rate at each temperature is constant up to a given concentration, and then it increases almost abruptly as the dopant concentration increases. This critical concentration is 8×10^{19} and 1.8×10^{20} at./cm^3 for Sb at 480 and 500°C, respectively, whilst for Ga it is $\sim1.5\times10^{20}$ at./cm^3 for both temperatures. These results cannot be simply explained within the known models of epitaxial rate enhancement due to dopant addition, thus pointing out the need for more extensive measurements and more realistic descriptions. (12 refs.)

102193 Structure and properties of evaporated amorphous films consisting of transition metal-metalloid alloys. N.I.Recheshter, E.Ya.Badinter, A.A.Yakunin, V.F.Bashev, I.S.Miroshnichenko (Ukraine & Russia Reunion Tercentenary State Univ., Dnepropetrovsk, USSR).
Fiz. Met. & Metalloved. (USSR), vol.55, no.6, p.1213-15 (June 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
A study was made of eutectic and hypereutectic Fe-B, Fe-Ni-P, and Ni-Fe-B alloys of the compositions (at.%): $Fe_{82.5}B_{17.5}$; $Fe_{68.5}Ni_8P_{23.5}$; $Ni_{69}Fe_{13.5}B_{17.5}$. Thin amorphous films were deposited by the ion-plasma evaporation method. The structure was determined by electron diffraction. The temperature dependences of the electrical resistivity and surface resistance were found. The temperature-time stability of the films in respect of their resistance was also studied. The observed changes were attributed to surface oxidation of the films. (3 refs.) *A.T.*

102194 Electron diffraction studies of metastable phase decay in amorphous bismuth with high hydrogen content. Yu.F.Komnik, B.I.Belevtsev, L.A.Yatsuk.
Fiz. Nizk. Temp. (USSR), vol.9, no.7, p.745-8 (July 1983). In Russian. English translation in: *Sov. J. Low Temp. Phys. (USA)*
The coordination structure of amorphous bismuth films was studied by electron diffraction technique. The films were evaporated in hydrogen atmosphere onto a substrate cooled by liquid helium down to 3.5K. The main problem was to study variations in the coordination structure of the films with the decay of the metastable phase *a*-Bi (H) at ~5K. The electron diffraction data were processed on an electronic computer to construct the radial distribution function of atomic density. It has been found that as the phase α-Bi (H) decays, an average number of atoms in the first coordination sphere decreases appreciably. The results may be taken as the basis for treatment of severe variations in resistivity and temperature of superconducting transition during the *a*-Bi (H) phase decay. (7 refs.)

102195 Characterization of tantalum-silicon films on GaAs at elevated temperatures. W.F.Tseng (Naval Res. Lab., Washington, DC, USA), B.Zhang, D.Schott, S.S.Lau, A.Christou, B.R.Wilkins.
IEEE Electron Device Lett. (USA), vol.EDL-4, no.7, p.207-9 (July 1983).
RF sputter-deposited tantalum-silicon films on GaAs have been investigated using four-point probe, glancing-angle X-ray diffraction, Auger electron spectroscopy, and MeV $^4He^+$ backscattering spectrometry as a function of annealing up to 850°C. Experimental results show that: 1) there is no observable Ta or Si migration from the $TaSi_2$ overlayer into the GaAs substrate; 2) the structure of the As-sputtered film is amorphous and crystallization into a polycrystalline $TaSi_2$ laser occurs at ~500°C accompanied by a reduction in electrical resistivity. After annealing at 650°C, As and/or Ga appear to have migrated into the $TaSi_2$ layer. The amount of this migration remains unchanged up to an annealing temperature of 850°C. On the other hand, migration of Ta and/or Si into the GaAs substrate is not detected up to 850°C. This absence of the Ta and/or Si migration contributes to the stability of the Schottky-diode characteristics against annealing reported previously. (7 refs.)

102196 Structural characterization of low-defect-density silicon on sapphire. K.W.Carey, F.A.Ponce, J.Amano, J.Aranovich (Hewlett-Packard Labs., Palo Alto, CA, USA).
J. Appl. Phys. (USA), vol.54, no.8, p.4414-20 (Aug. 1983).
The structure of (100) silicon on (1102) sapphire is discussed for films grown by a special, defect-limiting process. A three-epitaxial-step technique, which utilizes both vapor phase epitaxy and solid phase epitaxy, is employed in the fabrication of low-defect-density films. The effects of different Si^+ implantation energies and initial Si film thicknesses on the final structure of the film are investigated in order to optimize the electrical characteristics. The improvement in crystalline quality during the solid phase epitaxy step is due to overgrowth of the [221]-oriented microtwins by the (001) Si matrix. Both Rutherford backscattering spectroscopy and cross-sectional transmission electron microscopy are used in the analysis of the structure of these films. (18 refs.)

102197 Reactively RF magnetron sputtered AlN films as gate dielectric. A.Fathimulla, A.A.Lakhani (Bendix Advanced Technol. Center, Columbia, MD, USA).
J. Appl. Phys. (USA), vol.54, no.8, p.4586-9 (Aug. 1983).
AlN films were deposited on silicon (100,111), fused quartz and GaAs (100) by sputtering in an $Ar:N_2$ gas mixture. The authors report on the physical and chemical analysis of the films with the aid of scanning electron microscopy, X-ray diffraction, and Auger electron spectroscopy. The films were found to be transparent with a *c*-axis orientation. Their bulk resistivity was 10^{15} Ω-cm. Quasistatic *C-V* analysis of Al/AlN/Si gave a flat-band voltage of 0.85 V, density of fixed charge 6×10^{10} cm^{-2} and a density of fast interface charge of 1.5×10^{11} cm^{-2} eV^{-1} at midgap. These films were formed at 250°C and offer an attractive fabrication alternative for gate dielectric. (17 refs.)

102198 TEM observations of laser-induced Pt and Au deposition on InP. D.Brasen, R.F.Karlicek, V.M.Donnelly (Bell Labs., Murray Hill, NJ, USA).
J. Electrochem. Soc. (USA), vol.130, no.7, p.1473-5 (July 1983).
Laser-induced deposits of Au or Pt on (001) InP surfaces have been examined by transmission electron microscopy. It is found that Pt deposition results in the formation of $Pt(P,In)_2$; whereas, in the case of Au, Au and Au_4In are observed. A description of the general morphology, together with a discussion as to why the compound and alloy might form is presented. (10 refs.)

102199 Atomic structure, size, and shape of small nickel particles in thin films. [Electron diffraction and FMR observations]. F.Vergand, D.Fargues (Lab. de Chimie Phys., Univ. Pierre et Marie Curie, Paris, France), O.Olivier, L.Bonneviot, M.Che.
J. Phys. Chem. (USA), vol.87, no.13, p.2373-6 (23 June 1983).
Structural properties of small nickel particles, embedded in aluminum or MgF_2 films, are studied both by transmission high-energy electron diffraction and by ferromagnetic resonance. These methods lead to knowledge of the lattice parameter, found equal to the bulk one, of the size, in the range of 2-4 nm, and of the shape of the particles, plates parallel to the film. A magnetostriction effect is evidenced for the samples embedded in aluminum. (13 refs.)

102200 Closed system LPE growth of $Cd_xHg_{1-x}Te$. K.E.Mironov, V.K.Ogorodnikov, V.D.Rozumnyi, V.I.Ivanov-Omskii (A.F. Ioffe Physico-Tech. Inst., Acad. of Sci., Leningrad, USSR).
Phys. Status Solidi a (Germany), vol.78, no.1, p.125-31 (16 July 1983).
Epitaxial layers of $Cd_xHg_{1-x}Te$ are grown on CdTe substrate from Hg- and Te-rich solutions, as well as from stoichiometric melts. The interaction of the gas phase with the substrate and the layer during LPE growth of $Cd_xHg_{1-x}Te$ $(0.2\leq x\leq0.3)$ in a closed system is studied. It is shown that mirror-smooth layers can be obtained under conditions precluding condensation of vapour on the epi-layer surface. The compositional profiles over the surface and in the direction of growth studied under different conditions are discussed. The mechanisms of constant and graded composition layer growth are considered. The advantages and shortcomings of the various methods of closed-system $Cd_xHg_{1-x}Te$ liquid-phase epitaxial growth are analyzed. (12 refs.)

102201 $(Ba,Sr)TiO_3$ heteroepitaxial films. V.M.Mukhortov, Yu.I.Golovko, V.A.Aleshin, E.V.Sviridov, Vl.M.Mukhortov, V.P.Dudkevich, E.G.Fesenko (Inst. of Phys., State Univ., Rostov on Don, USSR).
Phys. Status Solidi a (Germany), vol.78, no.1, p.253-7 (16 July 1983).
Heteroepitaxial $(Ba,Sr)TiO_3$ films are obtained on MgO crystals cut by RF sputtering. An altering of the film growth mechanism by means of a thee dimensional nucleation in the mechanism of monolayer growth in dependence of the deposition conditions is proved to be possible. A change of the film structure at the ferroelectric phase transition temperature is observed. The peculiarities of film domain configurations are described. (11 refs.)

102202 Observation of voids in thin silver films by TEM. S.K.Sharma, J.Spitz (Lab. d'Etudes des Materiaux Mince, CENG, Grenoble, France).
Prakt. Metallogr. (Germany), vol.20, no.5, p.245-53 (May 1983). In English, German.
The defocus contrast technique offers a powerful tool to observe small voids in materials and for their studies. A high density of voids observed in silver films on RT aging and high temperature annealing is caused as a result of accumulation of vacancies. Void formation and growth can be suitably explained on the basis of annihilation of excess vacancies (by vacancy migration) at sinks such as pre-existing voids or other vacancies in the as-deposited films. Vacancies can be created as well as annihilated at the sinks. (13 refs.)

102203 X-ray photoemission study of $Fe-Al_2O_3$ granular thin films. E.Paparazzo, J.L.Dormann, D.Fiorani (CNR, Roma, Italy).
Phys. Rev. B (USA), vol.28, no.2, p.1154-7 (15 July 1983).
Granular $Fe-Al_2O_3$ thin films, composed of small iron particles dispersed in an amorphous alumina matrix, have been analyzed as a function of the composition and of the depth by X-ray photoemission spectroscopy. The surface

of all the samples is composed of a fully oxidized Fe^{3+} form within an alumina-rich partly hydrated region, and the surface quantitative composition is highly dependent on the bulk composition. After Ar^+ etching, metallic iron and iron aluminates become apparent. The concentration of the first species increases with increasing depth and the iron content in the bulk of the granular films. (18 refs.)

102204 Small-angle neutron scattering study of anisotropic growth morphology and irreversible photodensification in *a*-$GeSe_3$ films. T.Rayment, S.R.Elliott (Dept. of Phys. Chem., Univ. of Cambridge, Cambridge, England).
Phys. Rev. B (USA), vol.28, no.2, p.1174-7 (15 July 1983).
The anisotropic growth morphology of obliquely evaporated amorphous $GeSe_3$ thin films has been studied by small-angle neutron scattering. Films deposited at 80° to the normal contain ellipsoidal voids 240 Å in length and 120 Å in diameter inclined at 70° to the normal, and which account for 47% of the volume. Absorption of band-gap light reduces the level and anisotropy of the scattering. The ellipsoidal voids collapse to form smaller spherical voids distributed isotropically. (7 refs.)

102205 Dimensional effect during wetting of amorphous carbon substrates with small islands of bismuth and lead films (particle sizes 5×10^{-7} to 3×10^{-5} cm). S.P.Chizhik, N.T.Gladkikh, L.K.Grigor'yeva, V.I.Larin, S.V.Dukarev, I.V.Kudrik, V.D.Frolov.
Russ. Metall. (GB), no.4, p.64-70 (1981). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.4, p.73-80 (1981). [received: June 1983]
Electron microscope examinations have shown that, for particle sizes below $2\text{-}3\times10^{-6}$ cm, a size effect is observed; the wetting angle decreases with decreasing particle size. Analysis of the dependence of the wetting angle on the particle size demonstrates a decrease in the surface energy of small metallic particles with decreasing particle size. The dependence of the surface energy on particle size was determined in the case of wetting lead and bismuth particles.. (22 refs.)

102206 Electron energy loss and Auger study of epitaxially grown Cu on Ni(100). P.A.Montano, P.P.Vaishnava, E.Boling (Dept. of Phys., West Virginia Univ., Morgantown, WV, USA).
Surf. Sci. (Netherlands), vol.130, no.1, p.191-202 (July 1983).
Auger and electron energy loss spectra have been measured on films of Cu epitaxially grown on Ni(100). The films were prepared under UHV conditions using a quartz crystal for monitoring the deposition rate. LEED measurements were taken to determine the orientation of the films. The presence of a monolayer of Cu on Ni(100) is enough to suppress the 3p-3d transition on the surface of the sample. The electron energy loss spectra were studied as a function of the primary electron energy (50 to 300 eV). The experimental results were qualitatively analyzed using recent theoretical calculations of Cooper and co-workers. The effect of a small Cu coverage on Ni(100) on the chemisorption of CO and O_2 was also studied. A strong suppression of CO chemisorption at room temperature was observed. In the case of O_2, large exposures are necessary in order to observe a significant amount of oxygen on the surface. The absence of any appreciable chemisorption on the surface of the metal is attributed to the lack of empty d-surface states. (15 refs.)

102207 Structure of thermally vaporized-on films of tungsten oxide WO_3. L.A.Aleshina, A.D.Fofanov, O.N.Shivrin (O.V. Kuusinen State Univ., Petrozavodsk, USSR).
Sov. Phys.-Dokl. (USA), vol.27, no.11, p.945-6 (Nov. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.1-3, p.596-8 (Nov. 1982).
Studies oxide films deposited on glass substrates by thermal evaporation of WO_3 powder in vacuum. The measurements of the X-rays scattered by the samples were carried out with a DRON-3 diffractometer. The use of Cu and Mo Kα radiation limited the region of measurements to values of $s=4\pi \sin\theta/\lambda=7.85$ and 17 $Å^{-1}$, respectively. The results were analyzed by the method of constructing pair functions D(r). (9 refs.)

102208 Kinetics of the formation of concentrational transitions between epitaxial layers of silicon in the process of growth from a molecular beam. M.I.Obsyannikov, R.G.Loginova, S.D.Tsarevskii (N.I. Lobachevskii Gorki Univ., Gorki, USSR).
Sov. Phys. J. (USA), vol.25, no.11, p.983-5 (Nov. 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.11, p.9-12 (Nov. 1982).
The doping kinetics of an epitaxial layer of silicon growing from a molecular beam is considered, taking mechanisms of impurity-atom capture by the growing layer into account: diffusional capture and immurement by atoms of the basic material. It is shown that, with increase in the growth rate, the thickness of the concentrational transition between regions with different levels of doping rises in the case of predominance of the first mechanism of impurity incorporation in the growing layer and decreases in the case of predominance of the second mechanism. Quantitative estimates of the thickness of the concentrational transition, taking account of the equilibrium coefficients of the impurity distribution between the surface region and the volume of the epitaxial layer, give satisfactory agreement with the experimental results. (12 refs.)

102209 Effects of growth temperature and substrate orientation on the entry of tellurium into epitaxial gallium arsenide films. L.G.Laverent'eva, M.D.Vilisova, V.A.Moskovkin, S.E.Toropov (V.D. Moskovkin, Physicotech. Inst., Tomsk State Univ., Tomsk, USSR).
Sov. Phys. J. (USA), vol.25, no.11, p.986-90 (Nov. 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.11, p.12-17 (Nov. 1982).
Measurements have been made on the electrophysical properties and rate of tellurium uptake in epitaxial films of gallium arsenide grown at various temperature (600-800°C) on GaAs substrates of principal and vicinal orientations. The activation energy for tellurium uptake has been determined and the rate-limiting stages for various faces have been examined. (20 refs.)

102210 Effects of gas flow speed and chlorine concentration on tellurium uptake in gas-phase epitaxy of gallium arsenide. L.G.Lavrent'eva, S.E.Toropov, L.P.Porokhovnichenko (V.D. Kuznetsov Physicotech. Inst., Tomsk State Univ., Tomsk, USSR).
Sov. Phys. J. (USA), vol.25, no.11, p.990-3 (Nov. 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.11, p.18-21 (Nov. 1982).
A comparison is made between the growth kinetics of gallium arsenide films and the uptake of tellurium in gas-phase epitaxy in a chlorine system. The rate-limiting stages for both processes are the same and are associated with diffusion through the boundary layer and the rates of surface processes (adsorption and desorption). (11 refs.)

102211 Structure of reactively sputtered nickel nitride films. G.J.W.R.Dorman, M.Sikkens (Dept. of Appl. Phys., Univ. of Groningen, Groningen, Netherlands).
Thin Solid Films (Switzerland), vol.105, no.3, p.251-8 (22 July 1983).
Thin nickel nitride films were prepared by reactive sputtering of nickel in an $Ar\text{-}N_2$ gas mixture. The structure of these films was investigated with X-ray and electron diffraction and was found to depend on the partial N_2 pressure during the sputtering process. All nickel nitrides which have been reported earlier, except Ni_3N_2, were observed in the sputtered films. At high partial N_2 pressures a body-centred tetragonal phase was observed. Up to now, this phase has not been explicitly reported as a nickel nitride. On the basis of the results the authors believe that the phase is another nickel nitride, namely Ni_2N. (21 refs.)

102212 Laser-initiated Ga-deposition on quartz substrates. Y.Rytz-Froidevaux, R.P.Salathe, H.H.Gilgen (Inst. of Appl. Phys., Univ. of Berne, Berne, Switzerland).
Laser Diagnostics and Photochemical Processing for Semiconductor Devices. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.29-34
The deposition of Ga on quartz substrates by photodissociation of trimethylgallium has been investigated. Light from a frequency doubled Ar-ion laser beam (257.2 nm) was focused onto quartz substrates. The Ar-ion laser was operated under CW or mode-locking conditions. The deposition rate has been investigated as a function of averaged UV power densities in the range of 1.8-1750 W/cm^2 and is shown to depend critically on the laser operating mode. For CW operation, the maximum growth rate within the focal zone is limited to 17 Å/s whereas under mode-locking conditions, no saturation is observed and the growth rate increases linearly with the laser power up to 70 Å/s at 1.75 kW/cm^2. (11 refs.)

102213 IR laser-induced deposition of silicon thin films. T.R.Gattuso, M.Meunier, D.Adler, J.S.Haggerty (MIT, Cambridge, MA, USA).
Laser Diagnostics and Photochemical Processing for Semiconductor Devices. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.215-22
The deposition of a-Si:H by means of CO_2 laser-induced pyrolysis of silane gas is described. Deposition rates were found to increase with increasing silane flow rate, reactor pressure, laser power and substrate temperature. Spin density decreased and both optical gap, and hydrogen content increased with decreasing substrate temperature. Electrical conductivities are reported. (28 refs.)

102214 Laser-induced solid phase crystallization in amorphous silicon films. G.L.Olson, S.A.Kokorowski, J.A.Roth, L.D.Hess (Hughes Res. Labs., Malibu, CA, USA).
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.141-54
The authors review recent work on the kinetics of laser-induced solid phase epitaxial crystallization of silicon as determined from time-resolved reflectivity measurements. Specific topics which are addressed include: the intrinsic kinetics of solid phase epitaxy (SPE) in ion-implanted and UHV-deposited films; SPE rate enhancement by implanted dopant atoms and the effects of electrical compensation on the SPE rate; and the temperature dependence of SPE and competing processes in samples containing impurity atoms at concentrations exceeding the solid solubility limit. The high temperature kinetics results are compared with predictions from transition state theory and are discussed with respect to a proposed depression in the amorphous Si melting temperature. (40 refs.)

102215 Solid-phase-epitaxial growth of ion implanted silicon using CW laser and electron beam annealing. J.Narayan, O.W.Holland (Solid State Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA), G.L.Olson.
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.155-63
The nature of residual damage in As^+, Sb^+, and In^+ implanted silicon after CW laser and e^- beam annealing has been studied using plan-view and cross-section electron microscopy. Lattice location of implanted atoms and their concentrations were determined by Rutherford backscattering and channeling techniques. Maximum substitutional concentrations achieved by furnace annealing in a temperature range of 500-600°C have been previously reported and greatly exceeded the retrograde solubility limits for all dopants studied. Higher temperatures and SPE growth rates characteristic of electron or CW laser annealing did not lead to greater incorporation of dopant within the lattice and often resulted in dopant precipitation. Dopant segregation at the surface was sometimes observed at higher temperatures. (4 refs.)

102216 Defect control during epitaxial regrowth by rapid thermal annealing. H.Baumgart (Bell Labs., Murray Hill, NJ, USA), G.K.Celler, D.J.Lischner, McD.Robinson, T.T.Sheng.
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.349-54
Rapid Thermal Annealing (RTA) with tungsten halogen lamps provides excellent regrowth of silicon layers damaged by ion implantation. In addition to minimizing dopant redistribution, the inherent advantage of this technique is good control of temperature gradients. The latter is instrumental in reducing the density of extended defects in the annealed samples. In contrast, solid phase laser annealing, which involves steep temperature gradients, always leaves interstitial dislocation loops and point defect clusters. The authors present a comparative study of crystal quality following laser processing and incoherent light annealing as well as furnace annealing of As, P and B ion implanted Si wafers. (9 refs.)

68.60 PHYSICAL PROPERTIES OF THIN FILMS, NONELECTRONIC

102217 Spin coated amorphous chalcogenide films: thermal properties. G.C.Chern, I.Lauks (Dept. of Electrical Engng. & Sci., Univ. of Pennsylvania, Philadelphia, PA, USA), A.R.McGhie.
J. Appl. Phys. (USA), vol.54, no.8, p.4596-601 (Aug. 1983).
The annealing behavior of spin coated thin films prepared from solutions of As_2S_3 dissolved in *n*-propylamine and *n*-butylamine has been investigated using IR, mass spectrometry, thermogravimetric analysis, and scanning calorimetry. As-prepared films containing arsenic sulfide glass domains with surfaces reacted as alkyl ammonium salt undergo loss of amine and hydrogen sulfide during heating. H_2S removal is believed to be accompanied by cross linking of glass domains resulting in a network glass containing only arsenic and sulfur. (10 refs.)

102218 Stress in polycrystalline and amorphous silicon thin films. R.T.Howe, R.S.Muller (Dept. of Electrical Engng. & Computer Sci., Univ. of California, Berkeley, CA, USA).
J. Appl. Phys. (USA), vol.54, no.8, p.4674-5 (Aug. 1983).
Stress in polycrystalline and amorphous silicon thin films deposited on oxidized silicon wafers is determined from the lengthening of the undercut edge of a silicon stripe. The technique measures only compressive stresses, has a stress resolution of 10^8 dyn/cm^2, and a spatial resolution on the wafer of 250 μm. Unannealed silicon thin films deposited on oxide are under high compressive stress (10^{10} dyn/cm^2). This stress is reduced below the resolution by annealing at 1100°C for 20 min in N_2, except for the thinnest polycrystalline silicon films studied (230 nm thick). (8 refs.)

102219 Strength characteristics of contact zone of thin metal films with alkali metal halides. S.A.Varchenya, A.A.Simanovskii, G.P.Upit.
Latv. PSR Zinat. Akad. Vestis Fiz. Teh. Zinat. Ser. (USSR), no.3, p.14-20 (1983). In Russian.
The adhesion tensile strength of vacuum deposited films of s-metals (Cu, Ag, Au, Al, In, Sn, Pb) has been studied at room temperature on alkali halide crystal (LiF, NaCl, KCl) surfaces. It has been shown that the failure occurs adhesively on the interface in the system Me/LiF and in Me/KCl cohesively within the crystal, whereas in Me/NaCl it manifests itself both adhesively on the interface and cohesively within the crystal. The adhesion tensile strength of atomically pure interfaces of Me/LiF and Me/NaCl systems exceeds, but not more than 1.5 times, that of adhesion strength of metals contacting the crystal surfaces prepared in the air. A qualitative correlation between the adhesion tensile strength and the dispersion energy of interaction in the systems investigated has been established. The adhesion of metals on alkali halide crystals is concluded to arise due to nonchemical interaction forces. (16 refs.)

68.90 OTHER TOPICS IN THE STRUCTURE AND NONELECTRONIC PROPERTIES OF SURFACES AND THIN FILMS

102220 The structure of ultrathin iron films on tungsten single-crystal surfaces. T.M.Gardiner (Phys. Inst., Tech. Univ. Clausthal, Clausthal-Zellerfeld, Germany).
Thin Solid Films (Switzerland), vol.105, no.3, p.213-25 (22 July 1983).
Ultrathin iron films vapour deposited onto the surface of a cylindrical tungsten single crystal are discussed. Results from work function change, Auger electron spectroscopic and low energy electron diffraction techniques are combined for a comparison of the initial stages of film growth on four low index planes. Advantage is taken of the opportunity to evaporate onto and simultaneously to make measurements on all surface orientations of the ⟨110⟩ zone. (11 refs.)

71.10 GENERAL THEORIES AND COMPUTATIONAL TECHNIQUES

102221 Unique labelling of many-electron states in multicentre systems. K.S.Chan, D.J.Newman (Dept. of Phys., Univ. of Hong Kong, Hong Kong).
J. Phys. A (GB), vol.16, no.11, p.2389-403 (1 Aug. 1983).
General methods of generating complete sets of states for $l(\leq 2n)$ electrons in s-states on *n* centres are described. It is shown that a unique labelling of these states can always be obtained using a fictitious S_n symmetry of the *n* centres. Explicit descriptions of eight, seven and four electrons on eight centres are derived and the problem of determining a unique labelling for these states on rigid eight-centre structures with cubic and lower symmetry is solved. (13 refs.)

102222 On the ground state energy of the symmetric Anderson model. K.Ueda (Inst. fur Theoretische Phys., ETH-Honggerberg, Zurich, Switzerland), W.Apel.
J. Phys. C (GB), vol.16, no.23, p.L849-52 (20 Aug. 1983).
In this article the authors examine the analytic structure of the Bethe ansatz solution for the ground state energy of the symmetric Anderson model as a function of the interaction *U*. They find that the energy is analytic for all real *U* and examine also the strong coupling limit $U \rightarrow \infty$. (15 refs.)

102223 Orbital constraints in the application of chemical pseudopotentials. J.Kumar Rudra, W.Beall Fowler (Dept. of Phys., Lehigh Univ., Bethlehem, PA, USA).
Phys. Rev. B (USA), vol.28, no.2, p.1056-60 (15 July 1983).
The authors have developed a modification of Anderson's chemical pseudopotential (CP) which appears to be more useful in tight-binding analyses of energy bands. They have also shown that the Anderson CP implies symmetry constraints on the orbitals which, if ignored, can lead to serious errors, especially in low-symmetry systems. (17 refs.)

102224 Self-consistent Hellmann-Feynman theorem for tight-binding models. J.Oliva (Dept. of Phys., Univ. of California, Berkely, CA, USA).
Phys. Rev. B (USA), vol.28, no.4, p.1798-801 (15 Aug. 1983).
A useful formal expression for the Hartree-Fock ground-state energy for the Anderson model is derived using a self-consistent variation of the Hellmann-Feynman idea. The major feature is that the total energy is given in terms of a single energy integral involving only the local self-energy at the impurity site. This differs from the usual approach in which the energy density is summed over ‘all’ sites. Generalization to a broader class of locally inhomogeneous and locally correlated tight-binding Hamiltonians is straightforward. (10 refs.)

102225 Intermediate order and its effect on the random field in an amorphous homopolar semiconductor. V.D.Iskra (Acad. of Agriculture, Ukrainian SSR).
Sov. Phys. J. (USA), vol.25, no.11, p.1002-5 (Nov. 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.11, p.31-4 (Nov. 1982).
The binary correlation function of a random field is calculated with the simplest model concepts, taking into account the presence of intermediate order in a macroscopically homogeneous and isotropic semiconductor. (4 refs.)

102226 Exact solution of Anderson Hamiltonian. A.Okiji (Osaka Univ., Osaka, Japan).
Solid State Phys. (Japan), vol.18, no.2, p.59-69 (Feb. 1983). In Japanese.
The Anderson model which can describe the electronic states of the dilute alloy, of the adsorbed atom at surfaces and of the mixed valence system is found to be exactly soluble. The properties of the exact solution are reviewed. Anderson-Hamiltonian and Bethe-Yang type equations are treated. Symmetrical Anderson Hamiltonian basic states are elucidated. Electronic specific heat at low temperatures is used as an example and the s-d Anderson models are compared. (32 refs.) *M.O.*

71.20 ELECTRONIC DENSITY OF STATES DETERMINATIONS

(inc. energy states of liquid semiconductors; see also 65.40 Lattice and electronic heat capacity)

102227 Anisotropy of optimum fluctuations in crystals with a degenerate spectrum. F.V.Kusmartsev, E.I.Rashba (L.D. Landau Inst. of Theoretical Phys., Acad. of Sci., USSR).
JETP Lett. (USA), vol.37, no.2, p.130-4 (20 Jan. 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.2, p.106-9 (20 Jan. 1983).
It is shown that in crystals with degenerate spherical bands optimum fluctuations, which form tails in the density of states in the forbidden band, are nonspherical. They are elongated or flattened. (10 refs.)

102228 Reconstruction of the density of states from its moments. A.Trias, M.Kiwi, M.Weissmann (Dept. de Fisica, Univ. Simon Bolivar, Caracas, Venezuela).
Phys. Rev. B (USA), vol.28, no.4, p.1859-63 (15 Aug. 1983).
The problem of the reconstruction of a non-negative spectral density from its low-order power moments is reexamined. With the assumption that the parameters of the continued-fraction representation of the Green's function obey a certain analytic expression, the authors derive an extrapolation procedure for them. This procedure leads to significantly improved results and is simple to implement. Several relevant examples of its application are provided and show the advantages of the method, which works adequately both for the translationally invariant case (ie. when Van Hove singularities are present) and also in the general disordered situation. The method is particularly useful in trying to estimate the position of the effective band edges (Lifshitz limits), for which it yields quite accurate values. (17 refs.)

71.25 NONLOCALIZED SINGLE-PARTICLE ELECTRONIC STATES

102229 Three-dimensional energy band in graphite and lithium-intercalated graphite. T.Fauster, F.J.Himpsel (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA), J.E.Fischer, E.W.Plummer.
Phys. Rev. Lett. (USA), vol.51, no.5, p.430-3 (1 Aug. 1983).
Angle-resolved inverse photoemission with tunable photon energies has been used to map out the unoccupied bands of graphite and lithium-intercalated graphite. At the Brillouin zone center the bottom of the lowest band is found at 4.0±0.5 eV above the Fermi level in graphite. This band shows strong dispersion normal to the basal plane in excellent agreement with recent self-consistent band-structure calculations. A similar three-dimensional band is found in lithium-intercalated graphite shifted 3 eV to lower energy. (13 refs.)

102230 Lithium-intercalated graphite: self-consistent electronic structure for stages one, two, and three. N.A.W.Holzwarth (Corp. Res.-Sci. Lab., Exxon Res. & Engng. Co., Linden, NJ, USA), S.G.Louie, S.Rabii.
Phys. Rev. B (USA), vol.28, no.2, p.1013-25 (15 July 1983).
First-principles electron structure calculations were carried out for LiC_6, LiC_{12}, LiC_{18} representing first-, second-, and third-stage model graphite intercalation compounds. By comparing the charge density of these compounds to that of reference grahite compounds, the authors could define a ‘total difference density’ in order to quantify charge transfer and polarization in these materials. The total difference is found to be highly concentrated near the intercalant ions. However, the conduction electrons (those in partially occupied bands) are found to have the distribution of virtually undistorted π wave functions and have a much more delocalized distribution than that of the total difference density. These two types of charge distributions account for many of the unusual electronic properties of graphite intercalation compounds. (33 refs.)

71.25C Techniques of band-structure calculation (general theory, applications of group theory, analytic continuation, etc)

102231 Bloch electrons in rational and irrational magnetic fields. G.M.Obermair (Univ. Regensburg, Regensburg, Germany).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.245-54 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
States of crystal electrons in a homogeneous magnetic field are of considerable practical and theoretical interest: they are the basis of the magneto-oscillatory effects which yield in turn information on Fermi surfaces, provided a theory connecting zero and finite magnetic field Bloch states exists. This is achieved by the semiclassical Peierls-Onsager theory which explains experimental results at least for nondegenerate bands. However, this metheod lacks a rigorous first principle derivation. Recently such a rigorous treatment has been developed; the obtained electronic spectra are in agreement with semiclassical results for simple bands; they show, moreover the splitting of degenerate bands and the detailed structure of magnetic breakdown. Another intriguing aspect of the problem is the coexistence of two pace lengths: lattice constant and Landau orbit diameter, which are almost always incommensurate (‘irrational’ versus ‘rational’ magnetic fields). As a consequence the spectrum exhibits an extremely complicated fine structure, related to the ‘chaotic’ properties of certain maps. (11 refs.)

102232 Electronic structure computations. Their role in the advancement of solid state physics. V.Heine (Cavendish Lab., Univ. of Cambridge, Cambridge, England).
Phys. Bull. (GB), vol.34, no.8, p.327-9 (Aug. 1983).
The author reviews the present state of electronic structure calculations and examines the contribution they can make to the mainstream of solid state physics. (no refs.)

102233 Error in the tetrahedron integration scheme. L.Kleinman (Dept. of Phys., Univ. of Texas, Austin, TX, USA).
Phys. Rev. B (USA), vol.28, no.2, p.1139-41 (15 July 1983).
The author shows that the widely used tetrahedron scheme for integrating functions over the Brillouin zone misweights the contributions from the k points at which the function has actually been evaluated. A simple example demonstrates that his misweighting can cause unacceptably large errors. A slight refinement of the scheme is shown to restore the correct weighting. (12 refs.)

102234 Band-structure effects and resistivity saturation. F.Guinea (Inst. for Theoretical Phys., Univ. of California, Santa Barbara, CA, USA).
Phys. Rev. B (USA), vol.28, no.2, p.1148-50 (15 July 1983).
It is shown that electron-phonon scatttering alters significantly the band structure of systems with narrow bands at high temperatures. This effect can be viewed as an increase in phonon-assisted hopping, which exactly compensates for the decrease in scattering time if the bands are narrow enough. The tendency towards saturation and saturation values are in good agreement with experiments. (15 refs.)

102235 New photoelectron spectroscopic procedure for the precise location of the edges of electron energy bands. B.C.Meyers, T.E.Feuchtwang (Dept. of Phys., Pennsylvania State Univ., University Park, PA, USA).
Phys. Rev. B (USA), vol.28, no.4, p.2212-15 (15 Aug. 1983).
An analysis of band-gap emission is presented for a semi-infinite Kronig-Penney model. The results suggest the singularities predicted for the energy derivative of the angle-resolved energy distribution may provide an accurate method to identify the edges of both initial (occupied) and final (unoccupied) energy bands of the photoemitter. (11 refs.)

102236 Nonrelativistic dispersional equations for crystals of sphalerite and diamond structure. A.A.Lipnik, K.Ya.Shtivel'man (Ternopol'skii Inst., USSR).
Sov. Phys. J. (USA), vol.25, no.11, p.977-80 (Nov. 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.11, p.3-6 (Nov. 1982).
The tenth- and eleventh-order dispersion equations obtained for sphalerite and diamond structures in previous works (1982) are reduced to algebraic form and compared. The dispersion equation for the sphalerite structure is factorized at the axes and in the planes of symmetry. At the axes Δ and Λ the factorization is complete; the zones of heavy and light holes are the same as in the diamond structure. At the axes Σ only a zone of heavy holes is isolated, which is again no different from that obtained from the diamond structure. Factorization of the equations for both structures in the whole of the (110) plane is performed. (5 refs.)

102237 Dispersion laws for the valence bands of crystals with the sphalerite structure. A.A.Lipnik, K.Ya.Shtivel'man (Ternopol'skii Pedagogical Inst., USSR).
Sov. Phys. J. (USA), vol.25, no.11, p.980-2 (Nov. 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.11, p.6-9 (Nov. 1982).
Approximate solutions are obtained—in analytic form—for the valence bands of crystals with the sphalerite structure at the symmetry axes and in the (110) symmetry planes. The values derived from them for the energy of heavy and light holes at the points X of the Brillouin band and also the maximum values of the spin-orbital splitting of the upper valence bands at the axes Δ and Λ are in good agreement with the available experimental data and the results of numerical calculations. (12 refs.)

71.25H Measurement of Fermi surface parameters

(inc. dHvA, magnetoacoustic, position annihilation, and cyclotron resonance studies, etc.)

102238 The effect of hydrostatic pressure on the Fermi surfaces of rubidium and cesium. I.M.Templeton (Div. of Phys., Nat. Res. Council of Canada, Ottawa, Canada).
J. Low Temp. Phys. (USA), vol.52, no.3-4, p.361-76 (Aug. 1983).
The anisotropy and absolute values of the pressure coefficients for the Fermi surfaces of rubidium and cesium in the 25-bar pressure range at 1K have been measured. In both cases the area pressure coefficient anisotropy is con-

siderably greater than the dimensional anisotropy about 4.7 times in Rb and 5.6 times in Cs. The mean values of $2.13_3 \pm 0.005 \times 10^{-2}$ kbar^{-1} for Rb and $2.87_4 \pm 0.0140\mathrm{M}10^{-2}$ kbar^{-1} for Cs, are in fair agreement with those derived from ultrasonic measurements of the bulk modulus, but are several percent lower than the corresponding piston-displacement figures. (18 refs.)

102239 Comment on 'de Haas-van Alphen study of coherent magnetic breakdown in magnesium'. L.Lorenzen, H.Smith (Phys. Lab. I, H.C. Orsted Inst., Copenhagen, Denmark).
Phys. Rev. Lett. (USA), vol.51, no.7, p.615 (15 Aug. 1983).
For original paper see ibid., vol.48, p.275 (1982). In a recent Letter Eddy and Stark (ES) reported the observation of a number of features in the de Haas-van Alphen spectra of pure Mg that are not accounted for by the theory of Falicov and Stachowiak (FS) (1966). In their search for an explanation of these differences the authors made a numerical comparison of Pippard's semiclassical network theory (1964) and the FS theory, and concluded that the two are inequivalent. ES calculated some Fourier coefficients (FC) of Pippard's two-dimensional density of states and found a difference period in addition to amplitude variations of the FC as a function of the Bragg-reflection probability $q^2 = 1 - \exp(H_0/H)$, H_0 being the breakdown field, both in disagreement with the FS theory. The present authors have performed similar calculations of the FC and reached the opposite conclusion that for the network in question the two theories are equivalent. (3 refs.)

71.25J Effective mass and g-factors

102240 Effective mass of electrons in $BaPb_{1-x}Bi_xO_3$. S.Tajima, K.Kitazawa, S.Tanaka (Dept. of Appl. Phys., Univ. of Tokyo, Tokyo, Japan).
Solid State Commun. (USA), vol.47, no.8, p.659-61 (Aug. 1983).
The reflectivity spectra of $BaPb_{1-x}Bi_xO_3$ were measured in near-infrared region in several samples. The effective masses for the metallic samples of compositions from $x=0$ to 0.25 were estimated from the observed plasma edges to be 0.5-0.8 m_e. These values are rather small comparing with those in other typical high T_c superconductors. (12 refs.)

Calculation of optical properties of semiconductors with the use of simple orbitals .... See Entry 102841

71.25M Electron energy states in amorphous and glassy solids

102241 Electronic structure of amorphous semiconductors. J.Robertson (Central Electricity Res. Labs., Leatherhead, England).
Adv. Phys. (GB), vol.32, no.3, p.361-452 (May-June 1983).
The authors review the bonding in a wide range of non-crystalline materials, such as the elemental and compound amorphous semiconductors, liquid semiconductors and, briefly, some oxide glasses and amorphous silicon dioxide. The review concentrates on the experimental determination of electronic structure from photoemission, optical spectra and core spectra and on its theoretical description, particularly using tight-binding methods. The review also describes the bonding at defects in amorphous semiconductors and in particular that of dopants and hydrogen in hydrogenated amorphous silicon (a-Si:H). (565 refs.)

102242 Electrons and phonons in metallic glasses. J.Hafner (Inst. fur Theoretische Phys., Tech. Univ. Wien, Wien, Austria).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.257-68 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
Reviews recent advances in the calculation of electronic and vibrational states in metallic glasses. The author starts with a brief discussion of the start of the art of structural modelling and the simplifications of the different modelling algorithms on the electronic and the vibrational properties. The various techniques for calculating the spectra of elementary excitations in the absence of translational symmetry (equation of motion method, recursion technique, multiple scattering cluster calculations, effective medium approximation) are critically reviewed. Exemplary applications of these methods to metallic glasses, involving comparisons with recent experiments on electron and phonon states are presented. (31 refs.)

102243 Capacitance temperature analysis of midgap states in hydrogenated amorphous silicon. D.Jousse, S.Deleonibus (Lab. de Phys. des Composants a Semiconducteurs, CNRS, Grenoble, France).
J. Appl. Phys. (USA), vol.54, no.7, p.4001-7 (July 1983).
Simultaneous low frequency capacitance-temperature and conductance-temperature measurements on Schottky diodes in the range 180-450K enable the authors to deduce the real density of bulk midgap states $N(E)$ of hydrogenated amorphous silicon in the zero frequency limit. The analysis of the results indicates that the interaction kinetics is controlled by the thermal release time of the midgap states. The response times are consistent with an electron capture cross section ranging from 2×10^{-16} to 5×10^{-15} cm^2, very similar to the value reported for crystalline Si-SiO_2 interface states. Furthermore, results show that thermal equilibrium is established directly with conduction band electrons at high temperature or through intermediate states at temperature lower than 300K. The high accuracy of the method is demonstrated by detecting 15% variations of $N(E)$ due to light-induced effects. The physical nature of midgap states is also discussed. (34 refs.)

102244 On electronic structure of interacting solitons with impurities in polyacetylene. B.R.Bulka (Inst. of Molecular Phys., Polish Acad. of Sci., Poznan, Poland).
Phys. Status Solidi b (Germany), vol.118, no.1, p.K57-9 (1 July 1983).
The author shows that the electronic structure of polyacetylene differs strongly when interactions are taken into account. The author studies a one-dimensional tight binding model with hopping integrals confined to nearest neighbours. The author assumes that interactions shift the atomic level at the centre of a soliton. It is legitimate as the Coulomb interaction part of a Hamiltonian in the Hartree-Fock approximation is $H_c = V_c \langle n_i \rangle n_O$, where $\langle n_i \rangle$ is the average number of electrons at the impurity. Thus the shift is $V = V_c \langle n_i \rangle$. For a covalent interaction the shift is $V \approx -t_{oi}{}^2/V_i$, where t_{oi} and V_i are the hopping integral and the atomic potentials difference of the nearest neighbour atom and the impurity. Defect levels are determined from poles of Green functions, which are expressed by continued fractions. (5 refs.)

102245 Synchrotron-radiation studies of the transition of hydrogenated amorphous carbon to graphitic carbon. D.Wesner (Brookhaven Nat. Lab., Upton, NY, USA), S.Krummacher, R.Carr, T.K.Sham, M.Strongin, W.Eberhardt, S.L.Weng, G.Williams, M.Howells, F.Kampas, S.Heald, F.W.Smith.
Phys. Rev. B (USA), vol.28, no.4, p.2152-6 (15 Aug. 1983).
Using the synchrotron-radiation facility at Brookhaven National Laboratory, the authors have studied the electronic structure of thin hydrogenated amorphous carbon films produced by DC glow discharges of hydrocarbons. Valence-band photoemission measurements on these films yielded information on the occupied valence-band density of states, while near-edge absorption at the carbon K edge elucidated features of the unoccupied conduction band. The as-deposited, unannealed films are essentially amorphous, showing no extended X-ray absorption fine-structure (EXAFS) features. Valence-band photoemission results show that these films are insulating, suggesting tetrahedral (diamondlike) coordination. The near-edge-absorption results, however, show some unsaturated carbon-carbon bonds as evidenced by a $1s \rightarrow \pi^*$ feature. Upon annealing, the films become more graphitic as evidenced by both the photoemission and near-edge-absorption measurements showing fine structure in agreement with that observed for crystalline or microcrystalline graphite. They also become conductive. Annealing is accompanied by evolution of hydrogen from the films, and this appears correlated with the development of certain features of the band structure as the film orders. The annealed films also show the beginnings of features in the EXAFS region. (18 refs.)

102246 Photo-induced changes in the bulk density of gap states in hydrogenated amorphous silicon associated with the Staebler-Wronski effect. J.D.Cohen (Dept. of Phys., Univ. of Oregon, Eugene, OR, USA), D.V.Lang, J.P.Harbison, A.M.Sergent.
Sol. Cells (Switzerland), vol.9, no.1-2, p.119-31 (June-July 1983).
The authors observe a reversible photo-induced modification in the bulk density of gap states in hydrogenated amorphous silicon associated with the Staebler-Wronski effect. Detailed analysis of deep level transient spectroscopy, admittance and thermally stimulated capacitance measurements indicates that as a result of prolonged illumination (1) a lowering of the bulk Fermi level occurs in the mobility gap, (2) a large increase occurs in the density of states below midgap and (3) no discernible change occurs in the midgap defect density normally associated with dangling bond defects. In addition the authors find that the annealing behavior of the light-induced effects indicates a broad range of activation energies. A comparison of these findings with measurements made by other groups is discussed briefly. (18 refs.)

71.25R Band structure of crystalline elemental semiconductors

102247 Energy-band distortion in highly doped silicon. D.S.Lee, J.G.Fossum (Dept. of Electrical Engng., Univ. of Florida, Gainesville, FL, USA).
IEEE Trans. Electron Devices (USA), vol.ED-30, no.6, p.626-34 (June 1983).
A plausible model for the doping dependences of the conduction-and valence-band shifts, and of the concomitant narrowings of the optical and electrical energy gaps, caused by high doping concentrations in silicon is developed by refining, extending, and combining previously described theories. A meaningful link is thereby established between the fundamental solid-state physics that underlies the energy-band distortion and the silicon device physics that describes the pragmatic ramifications of it. The important many-body effects, which produce actual rigid shifts in the conduction and valence bands, are identified and characterized, and are shown to exclusively narrow the optical energy gap. The electrical energy-gap narrowing comprises additional effective shifts defined by the band tails due to the randomness of the dopant distribution, which are described. Predictions of the optical and electrical energy-gap narrowings, the difference between which is explained physically for the first time, are shown to agree well with measurements from several independent experiments. (43 refs.)

71.25T Band structure of crystalline semiconductor compounds and insulators

102248 Studies on electronic processes in graphite during the last decade in Japan. T.Tsuzuku (Coll. of Sci. & Technol., Nihon Univ., Tokyo, Japan).
Carbon (GB), vol.21, no.4, p.415-27 (1983).
Briefly reviews the studies on the energy band structure and electron transport properties of graphite which have been performed in Japan mostly during the last decade, since around 1970. Topics dealt with are the overall band structure calculated on the basis of the combined OPW-TB approximation, topographical research of the Fermi surface, anomalous transport phenomena resulting from the extremely strong electron-phonon coupling, *c*-axis conduction in connection with the stacking fault structure, new important findings obtained through further detailed investigation of galvano-magnetic effects, and the quantum-limit behaviors under ultrahigh magnetic fields leading to an electronic phase transition. (67 refs.)

102249 Electronic structure of disordered alloys. II. Self-consistent cluster CPA. Application to III-V ternary alloys. A.Mookerjee, V.K.Srivastava, V.Choudhry (Dept. of Phys., Indian Inst. of Technol., Kanpur, India).
J. Phys. C (GB), vol.16, no.23, p.4555-64 (20 Aug. 1983).
In pt.I (see ibid., vol.15, p.1939, 1982), a self-consistent cluster CPA, generalised to take into account the effects of clusters, was developed. Off-diagonal disorder and short-ranged order were also taken into account. In this paper the method has been applied to calculate the density of states of the valence band of ternary random III-V semiconducting alloys. (11 refs.)

102250 Photoacoustic determination of the band gaps of Ca_2MnO_4 and $Ca_3Mn_2O_7$. M.L.Norton, R.Tom, W.S.Glaunsinger (Dept. of Chem., Arizona State Univ., Tempe, AZ, USA).
J. Solid State Chem. (USA), vol.48, no.2, p.242-5 (1 July 1983).
Black powders of the magnetically layered semiconductors Ca_2MnO_4 and $Ca_3Mn_2O_7$ prepared by a carbonate-precursor technique have been investigated by photoacoustic spectroscopy (PAS) over the energy range 1.25-4 eV. The band-gap energies of these two compounds have been evaluated to be 1.6 and 1.4 (± 0.1) eV, respectively. It is concluded that PAS is a most useful method for determining the variation of the band gap with composition in large band-gap polycrystalline semiconductors. (10 refs.)

102251 Electronic structure of some binary uranium and thorium oxides and halides. G.C.Allen, P.M.Tucker, J.W.Tyler (Berkeley Nuclear Labs., CEGB, Berkeley, England).
Philos. Mag. B (GB), vol.48, no.1, p.63-75 (July 1983).
X-ray photoelectron spectra of U and Th 4f core levels and valence bands have been recorded from UF_4, UCl_4, ThF_4 and $ThCl_4$ using a Kratos ES300 X-ray photo-electron spectrometer. The spectra are compared with their counterparts recorded from uranium and thorium dioxide surfaces. The results obtained are discussed as a function of metal ionicity, the covalency of the metal-ligand bond and the participation of 5f electrons in bonding. (27 refs.)

102252 Electronic band structure of stishovite (tetragonal SiO_2). J.Kumar Rudra, W.Beall Fowler (Dept. of Phys., Lehigh Univ., Bethlehem, PA, USA).
Phys. Rev. B (USA), vol.28, no.2, p.1061-7 (15 July 1983).
The authors have calculated the valence-band structure of stishovite, a tetragonal form of SiO_2, using a simple tight-binding method. As in similar fits to computed valence bands in α-quartz and β-cristobalite, only oxygen orbitals are used in the basis set. Values of the tight-binding parameters are based on the earlier calculations. A direct forbidden optical edge is predicted, as found in other tetragonal oxides of group-IV elements. There is no gap between bonding and nonbonding valence bands, in contrast to forms of SiO_2 which exhibit twofold oxygen coordination. Implications regarding the electronic structure of a-SiO_2 are discussed. (28 refs.)

102253 Evidence of nonparabolic-band effect on two-photon spectrum of ZnSe. I.M.Catalano, A.Cingolani (Dipartimento di Fisica, Univ. degli Studi di Bari, Bari, Italy).
Phys. Rev. B (USA), vol.28, no.2, p.1130-1 (15 July 1983).
The magnitude and frequency dependence of the two-photon-absorption (TPA) coefficient in ZnSe have been measured for photon energies significantly greater than the energy-band gap E_g. Valence-band degeneracy and nonparabolicity effects on the TPA mechanism for a typical zinc-blende semiconductor are proven. (7 refs.)

102254 Simplified self-interaction correction applied to the energy bands of neon and sodium chloride. M.R.Norman (Dept. of Phys., Tulane Univ., New Orleans, LA, USA), J.P.Perdew.
Phys. Rev. B (USA), vol.28, no.4, p.2135-9 (15 Aug. 1983).
The local-density approximation (LDA) for the exchange-correlation potential underestimates the fundamental energy gaps of insulators by about 40%. When a simplified self-interaction correction (SSIC) is applied to the band structures of Ne and NaCl, vast improvements over LDA are found in the gaps, with little change in the valence-band widths or conduction-band structures. Because it is applied directly to the Bloch orbital representation, SSIC is very easy to incorporate into LDA computer codes. Results are also reported using the Langreth-Mehl (LM) generalized gradient correction to LDA. The LM potential, which the authors regard as a close approximation to the exact Kohn-Sham potential yields band structures very close to those of LDA. (29 refs.)

102255 Co (III) ions high-spin configuration in nonstoichiometric Co_3O_4 films. I.D.Belova, Yu.E.Roginskaya, R.R.Shifrina, S.G.Gagarin, Yu.V.Plekhanov, Yu.N.Venevtsev (Karpov Inst. of Phys. Chem., Moscow, USSR).
Solid State Commun. (USA), vol.47, no.8, p.577-84 (Aug. 1983).
Optical spectra in UV, visible and near IR wavelength range have been measured and the SCF $X_\alpha SW$ method calculation of Co_3O_4 electronic structure has been carried out. The nature of absorption bands observed has been revealed. As shown, the principal peculiarity of the nonstoichiometric films electronic structure compared with 'bulk' samples is a stabilization of Co(III) ions high-spin configuration in Co_3O_4 spinel octahedral sublattice. (17 refs.)

102256 Electronic structures of the $LaBO_3$ (B=Co, Fe, Al) perovskite oxides related to their catalysis. I.Kojima, H.Adachi, I.Yasumori (Dept. of Chem., Tokyo Inst. of Technol., Tokyo, Japan).
Surf. Sci. (Netherlands), vol.130, no.1, p.50-62 (July 1983).
The discrete-variational (DV) $X\alpha$ molecular orbital method has been applied to investigate the bulk and surface electronic structures of perovskite oxides such as $LaCoO_3$, $LaFeO_3$ and $LaAlO_3$. The calculated XPS spectra for these oxides are in good agreement with the experimental ones and only the $LaCoO_3$ exhibited a rather high electron density of states near the Fermi level (E_F). The catalytic behavior of these oxides is discussed on the basis of their electronic structures; the marked catalysis by $LaCoO_3$ is associated with electron occupation of crystal field d states near E_F and with the buildup of surface charge so as to enhance the electron transfer between a surface cation and an interacting molecule. 71.30 METAL-INSULATOR TRANSITIONS

102257 Experimental tests of localization in semiconductors [metal-insulator transition]. M.A.Paalanen, G.A.Thomas (Bell Labs., Murray Hill, NJ, USA).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.27-34 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
Experimental results indicate that both randomness and electron-electron interactions are important driving mechanisms of the metal-insulator transition in noncrystalline systems. Although previous studies are consistent with Mott's minimum metallic conductivity, measurements at much lower temperatures and higher resolution in density argue for a continuous transition. A review of these experiments compared to the latest theoretical developments indicates that understanding is still incomplete. (16 refs.)

102258 The metal insulator transition in disordered electron systems. A.Gold, W.Gotze (Dept. of Phys., Tech. Univ. Munchen, Garching, Germany).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.47-53 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
The selfconsistent current relaxation theory for the motion of fermions in a random potential is generalized by taking into account Coulomb interaction effects. In particular the influence of various local field corrections to the random phase approximation on the metal insulator transition point are examined. The conductivity and the static dielectric constant near the mobility edge are calculated. (23 refs.)

102259 Metal-nonmetal transition in copper-xenon system. A.I.Eatah (School of Maths. & Phys., Univ. of East Anglia, Norwich, England), A.A.Ghani Awad.
J. Chem. Phys. (USA), vol.79, no.3, p.1552-4 (1 Aug. 1983).
As part of a series of investigations of metal-nonmetal transition, containing copper as metal, the authors have carried out measurements of the electrical conductivity of the Cu-Xe system. The results of measurements suggest that the transition is Mott's type. They put forward the indications and counterindications of such transition. (15 refs.)

102260 Optical and thermal evidence for the metal-insulator transition in 1T-TaS_2. S.C.Bayliss, A.Clarke, W.Y.Liang (Cavendish Lab., Univ. of Cambridge, Cambridge, England).
J. Phys. C (GB), vol.16, no.23, p.L831-4 (20 Aug. 1983).
Reports on thermal evidence for the existence of the phase transition from the incommensurate charge density wave state to the undistorted form of 1T-TaS_2. The effect of the transition on the reflectivity spectra is discussed in terms of a metal-insulator transition. (6 refs.)

102261 The metal-insulator transitions in the Peierls chain. P.Y.Le Daeron, S.Aubry (Center for Nonlinear Studies, Los Alamos Nat. Lab., Los Alamos, NM, USA).
J. Phys. C (GB), vol.16, no.24, p.4827-38 (30 Aug. 1983).
The ground state (at 0K) of a discrete molecular-crystal model for the Peierls chain with classical atoms and non-interacting spinless quantum electrons is calculated numerically as a function of the electron-phonon coupling for an 'irrational' electron concentration. A metal-insulator transition arising from the extinction of the Frohlich conductivity for the incommensurate system is observed when the Peierls gap is only 10% of the total unperturbed bandwidth. Beyond the critical coupling, the Frohlich mode disappears and the electrons are exponentially localised but the lattice distortion remains incommensurate (the polaron lattice). In this region, the Peierls-Nabarro barrier does not vanish and is calculated. The existence of metastable Fermi glasses is also proved, but they are shown to have an energy larger than that of the incommensurate ground state. The observed transition is identified as a transition by breaking of analyticity, which is similar to the one found previously in the Frenkel-Kontorova model. This behaviour is explained as being a consequence of the competition between the Fermi and the lattice wavevectors, which are incommensurate with each other. (26 refs.)

102262 Nonmetal-metal transition in NiS and its impurity-substituted materials. S.Anzai (Keio Univ., Yokohama, Japan).
Oyo Buturi (Japan), vol.52, no.3, p.212-19 (March 1983). In Japanese.
Outlines the White-Mott transition model describing a cause for the nonmetal-metal transition (NMT) in NiS. Furthermore, the model is examined using spectroscopic data. Experimental results for the effect of impurity substitution on the NMT in NiS are reviewed from the standpoints of: (1) volume change due to substitution, (2) interaction change due to the difference in electronegativity between Ni or S and impurity elements, (3) e_g electron change due to substitution, and (4) local density due to impurities. (39 refs.) *K.B.*

102263 The metal insulator transition in two-dimensional systems with charged impurities. A.Gold, W.Gotze (Phys.-Dept., Tech. Univ., Munchen, Garching, Germany).
Solid State Commun. (USA), vol.47, no.8, p.627-9 (Aug. 1983).
The motion of interacting electrons in an array of charged impurities in two dimensions is discussed within a generalized selfconsistent current relaxation theory. The ratio of impurity density n_i to electron density n_c, where the metal insulator transition takes place, is shown to depend on n_c and varies between 0.2 and 10. A comparison of the theory with mobility measurements of Na^+ drift experiments in inversion layers is made. (18 refs.)

71.35 EXCITONS AND RELATED PHENOMENA

(inc. electron-hole drops)

102264 Quasi-two-dimensional excitons in GaAs/Al$_x$Ga$_{1-x}$As semiconductor multiple quantum well structures. D.S.Chemla (Bell Labs., Holmdel, NJ, USA).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.607-37 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
Reviews recent studies on excitons in GaAs/Al$_x$Ga$_{1-x}$As multiple quantum well structures (MQWS). After a theoretical summary, the spectroscopy of quasi-two-dimensional excitons is presented. Experiments at low temperature and high excitation are discussed. Excitons in MQWS can be resolved at room temperature. The behavior of excitons in this unusual temperature range is analyzed and the potential applications to optical signal processing are pointed out. (50 refs.)

102265 Secondary emission due to recombination of excitons near indirect band bottom. I. General feature. T.Iida, M.Sakai, T.Karasawa, T.Komatsu, Y.Kaifu (Dept. of Phys., Osaka City Univ., Osaka, Japan).
J. Phys. C (GB), vol.16, no.23, p.4719-32 (20 Aug. 1983).
The secondary emission, due to recombination of excitons in the vicinity of the indirect band bottom is investigated, where excitons relax their kinetic energy through mutliple scatterings with acoustic phonons and a nonradiative decay process. In this case, the secondary emission can be separated into the two parts: the Raman scattering (RS) and the hot luminescence (HL). The spectral lineshape of the HL directly reflects the exciton distribution near the band bottom. The distribution has been calculated by the Fokker-Planck equation with the source term of exciton supply through the indirect absorption process. It is shown that the excitation spectrum of the RS line and the spectral structure of the HL strongly depend on the two quantities: the kinetic energy of an exciton with the sound velocity and the nonradiative decay rate. General features of RS, HL and their relationship are studied for a system with material constants appropriate to BiI$_3$, since the experiments show that this is an ideal system for the authors' purpose. (11 refs.)

102266 Theory of the exciton bound to an isoelectronic trap in GaP. W.T.Masselink, Yia-Chung Chang (Dept. of Phys., Univ. of Illinois, Urbana, IL, USA).
Phys. Rev. Lett. (USA), vol.51, no.6, p.509-12 (8 Aug. 1983).
A theoretical calculation for the electronic structure of an exciton bound to a nitrogen trap in GaP is presented. For the first time, the band-structure effect for both the electron and hole and their mutual Coulomb interaction are included simultaneously. It is found that the bare electron is bound by only 0.6 meV instead of 8 meV as usually quoted. Furthermore, this calculation predicts the *A-B* splitting and the oscillator strength of the bound-exciton luminescence in good agreement with the experimental data. (18 refs.)

102267 Picosecond kinetics of the donor bound exciton in Cd$_{1-x}$Mn$_x$Se. J.H.Harris, A.V.Nurmikko (Div. of Engng., Brown Univ., Providence, RI, USA).
Phys. Rev. B (USA), vol.28, no.2, p.1181-3 (15 July 1983).
Dynamics for the donor bound exciton complex in the semimagnetic semiconductor CdMnSe are investigated by picosecond spectroscopy, with emphasis on real-time energy diffusion within the exciton energy range. Direct evidence for the inhomogeneous character of this transition is presented, together with first measurements for the exciton formation and decay rates. (8 refs.)

102268 Coulomb resonance at the Fermi level of the electron-hole liquid in germanium. V.M.Asnin, V.I.Stepanov (A.F. Ioffe Phys.-Tech. Inst., Acad. of Sci., Leningrad, USSR), R.Zimmermann, M.Rosler.
Solid State Commun. (USA), vol.47, no.8, p.655-7 (Aug. 1983).
Using a modulation technique of transmitted probe light a recently predicted enhanced absorption in the electron-hole liquid is confirmed. This resonance is due to the Coulomb interaction acting resonantly at the Fermi edge. Comparison is made with calculations taking into account a screened potential, self-energy shifted bands, and warping of the valence band. (11 refs.)

71.36 POLARITONS

(inc. photon-phonon and photon-magnon interactions)

102269 Hamiltonian formalism for giant polaritons. K.C.Liu (Schools of Appl. Phys. & Electrical Engng., Cornell Univ., Ithaca, NY, USA).
Phys. Rev. B (USA), vol.28, no.4, p.2254-6 (15 Aug. 1983).
The author considers the interaction of a radiation field, with excitons at high density, where the excitons cannot be approximated as bosons. In the approach, a dynamically equivalent Hamiltonian is constructed for relegating the nonboson commutation relations to boson commutation relations. For the self-consistent case, the ad hoc effective Hamiltonian can be made diagonal, yielding the eigenenergy of a giant polariton. (11 refs.)

71.38 POLARONS AND ELECTRON-PHONON INTERACTIONS

(for electron-phonon interactions in lattices, see also 63.20K)

102270 Jahn-Teller effect in itinerant electron systems: the Jahn-Teller polaron. K.-H Hock, H.Nickisch (Inst. fur Festkorperphys., Tech. Hochschule Darmstadt, Darmstadt, Germany), H.Thomas.
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.237-43 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
Studies the formation of a Jahn-Teller polaron in a narrow-band conductor with strong Jahn-Teller coupling. It is shown that the competition between the delocalization effect of tunnelling and the localization effect of JT-coupling gives rise to a transition from an itinerant electron state to a JT-polaron state with very effective mass. (6 refs.)

102271 Kinks and polarons in polyacetylene. T.Sano, Y.J.I'Haya (Dept. of Materials Sci., Univ. of Electro-Communications, Tokyo, Japan).
J. Chem. Phys. (USA), vol.79, no.4, p.2060-4 (15 Aug. 1983).
Various defect states in a finite trans-polyacetylene chain are studied by a geometry optimization method with a tight-binding Hamiltonian of Longuet-Higgins and Salem. It is shown that the defect obtained forms a ϕ-four kink or two combined kinks such as a polaron, being independent of chain size whenever the chains are longer than the defect width. The defect formation energy is local in the vicinity of the defect. The creation energies of the kink and polaron at rest have been determined by means of extrapolation to infinite chain size. The results obtained are in good agreement with those estimated from the analytical solutions in the continuum models. (12 refs.)

102272 Non-linear spin-density excitations in 1-D organic polymers. C.Aslangul, D.Saint-James (Ecole Normale Superieure, Univ. Paris VII, Paris, France).
J. Phys. (France), vol.44, no.8, p.953-5 (Aug. 1983).
It is shown that kink and bag-like solitons should exist in 1-D organic polymers when the ground state corresponds to an antiferromagnetic spin density wave. (6 refs.)

102273 Electron-phonon scattering in polyparaphenylene. C.Menendez, F.Guinea (Dept. de Fisica del Estado Solido, Univ. Autonoma de Madrid, Madrid, Spain).
Phys. Rev. B (USA), vol.28, no.4, p.2183-90 (15 Aug. 1983).
Phonons and the effects induced by terms on the electronic spectrum of polyparaphenylene [(C$_6$H$_4$)$_n$], are analyzed. A model of local forces and electronic interactions is used. The results are very insensitive to the long-range structure of the polymer chain. Electron-phonon coupling is also studied within a local formalism which greatly facilitates the calculation and the understanding of the effects of the interactions. It is shown that phonons induce significant changes near the edges of the electronic bands. The gap narrowing, effective-mass enhancement, and mobilities have been calculated. The influence of these polaronic effects on the transport properties of the polymer is considered, as well as its applicability to other conjugated systems. (20 refs.)

71.45G Exchange, correlation, dielectric and magnetic functions, plasmons

102274 Long range surface plasmons in birefringent media. G.I.Stegeman (Optical Sci. Center, Univ. of Arizona, Tucson, AZ, USA).
Appl. Opt. (USA), vol.22, no.15, p.2243-5 (1 Aug. 1983).
Analyzes the propagation properties of surface plasmon polaritons guided by thin metal films bounded by birefringent media. (8 refs.)

102275 Long-range surface plasmons in electrode structures. G.I.Stegeman (Arizona Res. Labs., Univ. of Arizona, Tucson, AZ, USA), J.J.Burke.
Appl. Phys. Lett. (USA), vol.43, no.3, p.221-3 (1 Aug. 1983).
The authors show that surface plasmon polaritons guided by thin metal electrodes can achieve millimeter plus propagation distances in the near infrared. (12 refs.)

102276 Surface plasmon contribution to the static dipole moment of an atom near a surface. P.Grossel, D.van Labeke (Lab. d'Optique, Faculte des Sci. de Reims, Reims, France), J.-M.Vigoureux.
Chem. Phys. Lett. (Netherlands), vol.99, no.3, p.193-6 (5 Aug. 1983).
The contribution of the surface plasmon waves to the static dipole moment of an atom located near a metallic surface is evaluated at every distance. In the near-zone limit this contribution varies as z^{-4}. (21 refs.)

102277 Dynamic correlations in the electron gas. F.Brosens, J.T.Devreese (Dept. of Phys., Univ. Antwerpen, Wilrijk, Belgium).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.223-35 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
For the calculation of many properties of simple metals, the 'jellium' model is widely used as a first approximation. The frequency- and wave vector-dependent dielectric function of this model not only allows to study its dielectric response, but also to calculate several other properties, e.g. the ground state energy, the density-fluctuation excitation spectrum, the pair correlation function. In the last decade, experimental and theoretical evidence revealed the need for a frequency-dependent description of exchange and correlation effects. The authors review a method for introducing these effects starting from the equation of motion for the Wigner distribution function in the presence of a weak external perturbation. The application of the Hartree-Fock decoupling in this equation of motion leads to an integro-differential equation, which is studied with a variational approach, leading to a frequency dependent 'local-field correction' $G(q,\omega)$. The dynamical exchange effects substantially influence the dielectric function. For instance, compared to RPA, the plasmon frequencies in the particle-hole continuum are appreciably lowered. This tendency is confirmed experimentally. Furthermore, in contrast to most other approximations, this method satisfies a large class of consistency requirements and sum rules, for which a dynamical treatment of exchange and correlation is required. (50 refs.)

102278 Magnetic susceptibility of Wigner's crystal. M.A.Kezalov, L.S.Kogan, G.V.Shuster, Sh.A.Kuliev.
Izv. Akad. Nauk Az. SSR Ser. Fiz.-Tekh. & Mat. Nauk (USSR), no.5, p.68-70 (1982). In Russian.
Magnetic susceptibility of Wigner's crystal is calculated. It is shown that the magnet susceptibility jump must be observed at the phase transition of the degenerate electron gas from the metal state in a nonconducting one (Wigner's crystal). This jump measurement is suggested to be used for the discovery of the transition into the nonmetal state in highly doped semiconductors. (6 refs.)

102279 Density-functional theory of excitation spectra of semiconductors: application to Si. C.S.Wang (Dept. of Phys. & Astron., Univ. of Maryland, College Park, MD, USA), W.E.Pickett.
Phys. Rev. Lett. (USA), vol.51, no.7, p.597-600 (15 Aug. 1983).
Presents a general approach to calculation of the quasiparticle excitation energies of semiconductors which includes the energy dependence of the self-energy with a local density-functional approach. Both direct and indirect band gaps in Si are in much better agreement with experiment than are the bands from the ground-state theory. The relatively large corrections arise only after the dielectric screening of the electron gas is modified to account for a gap in the excitation spectrum. (16 refs.)

102280 Fractional quantization of the Hall effect: a hierarchy of incompressible quantum fluid states. F.D.M.Haldane (Dept. of Phys., Univ. of Southern California, Los Angeles, CA, USA).
Phys. Rev. Lett. (USA), vol.51, no.7, p.605-8 (15 Aug. 1983).
With use of spherical geometry, a translationally invariant version of Laughlin's proposed 'incompressible quantum fluid' state of the two-dimensional electron gas is formulated, and extended to a hierarchy of continued-fraction Landau-level filling factors ν. Observed anomalies at $\nu={}^2/_5, {}^2/_7$ are explained by fluids deriving from a $\nu={}^1/_3$ parent. (9 refs.)

102281 Exact high-frequency theory of surface plasmas. De-xin Lu (Dept. of Phys., Northeastern Univ., Boston, MA, USA), K.I.Golden.
Phys. Rev. A (USA), vol.28, no.2, p.976-86 (Aug. 1983).
New frequency-moment sum rules are formulated for the purpose of assessing the behavior of two-dimensional classical electron liquids at high frequencies $[\omega\gg\omega_p(k)]$. For nonzero coupling strength (characterized by γ), the convergence of new fifth-frequency-moment rule $\langle\omega^5\rangle$ is guaranteed at short range. However, in the Vlasov ($\gamma=0$) limit, $\langle\omega^5\rangle$ exhibits marked $1/\gamma$ and Inγ divergences. The ensuing breakdown in the high-frequency structure of the dielectric response function leads to the conclusion that the Vlasov limit is unphysical for two-dimensional classical electron liquids in the high-frequency domain. The authors theory complements the current low-frequency $[\omega\simeq\omega_p(k)]$ theories, all of which reinforce the notion that the reduced dimensionality of surface plasmas considerably enhances short-range correlation and dynamic collisional effects. (24 refs.)

102282 Comments on 'Time-dependent Hartree-Fock formalism for the dielectric function'. S.Das Sarma (Univ. of Maryland, College Park, MD, USA), W.Hanke.
Phys. Rev. B (USA), vol.28, no.2, p.1134-5 (15 July 1983).
For original paper see ibid., vol. 19, p.1720 (1979). The correct formalism for obtaining a dielectric function consistent with the Hartree-Fock approximation is outlined. It is pointed out that a recent calculation by Brener and Fry does violate Ward identities and is not a conserving approximation. To be consistent with the Hartree-Fock single-particle equation the infinite series of 'ladder-bubble' diagrams must be included. (13 refs.)

102283 Possibility of acoustic plasmons in mixed-valence metals and their interaction with phonons. S.K.Sinha (Argonne Nat. Lab., Argonne, IL, USA), C.M.Varma.
Phys. Rev. B (USA), vol.28, no.4, p.1663-6 (15 Aug. 1983).
Mixed-valence metals are characterized by the presence of both the very heavy *f* and the light *s-d* electrons near the Fermi surface. These conditions are propitious for the existence of the plasmon branch with acoustic character. The authors derive the dispersion relation for such modes and consider their interaction with the phonons of the lattice. The longitudinal sound velocity is shown to be strongly reduced by the interaction, as is experimentally observed. It is proposed that ultrasonic experiments be used to directly observe the acoustic plasmons. (19 refs.)

102284 Photoacoustic study of plasmon resonance absorption in a diffraction grating. T.Inagaki, M.Motosuga, K.Yamamori (Dept. of Phys., Osaka Kyoiku Univ., Osaka, Japan), E.T.Arakawa.
Phys. Rev. B (USA), vol.28, no.4, p.1740-4 (15 Aug. 1983).
Plasmon resonance absorption in a 520-line/mm silver-coated diffraction grating was measured as a function of the angle of ruling orientation relative to the plane of photon incidence by a photoacoustic method. The experimental results of absorptance changes as a function of ruling orientation were found to be consistent with predictions from the first-order perturbation theory for roughness-induced photoabsorption. A discrepancy was found, however, between the absorptance values observed and the values calculated from the first-order theory. (35 refs.)

102285 Static structure factor and electron-electron correlations in Be. A comparison of experiment with electron-gas theory. G.Mazzone, F.Sacchetti, V.Contini (Dipartimento Tecnologie Intersettoriali di Base, Centro Ricerche Energetiche della Casaccia, Roma, Italy).
Phys. Rev. B (USA), vol.28, no.4, p.1772-80 (15 Aug. 1983).
The inelastic scattering cross section of metallic Be has been determined from an X-ray scattering experiment. The conditions under which the electronic contribution (static structure factor) can be extracted from such an experiment are discussed together with the approximations which have to be introduced in order to distinguish between core and band contributions. Accordingly, the static structure factor and the exchange and correlation energy of conduction electrons in Be have been determined. These quantities agree within experimental accuracy ($\sim$5%) with current electron-gas theory. From the static structure factor the electron-electron pair-correlation function has been deduced and compared with corresponding calculations for jellium. To this purpose the unavoidable experimental limitations on data accuracy and the theoretical difficulties which are encountered when performing direct first-principles calculations are discussed. (40 refs.)

102286 Dielectric formulation of strongly coupled electron liquids at metallic densities. VII. Spin-dependent correlations. K.Utsumi, S.Ichimaru (Dept. of Phys., Univ. of Tokyo, Tokyo, Japan).
Phys. Rev. B (USA), vol.28, no.4, p.1792-7 (15 Aug. 1983).
For pt.VI see Phys. Rev. A, vol.26, p.603 (1982). A parametrized expression for the paramagnetic spin susceptibility of the electron liquid at metallic densities is obtained through investigation of spin-dependent local-field corrections. The spin-susceptibility sum rule and the Pauli-principle restriction on the correlations are carefully taken into account. Physical effects of the exchange and Coulomb-induced correlations are investigated numerically on spin-dependent properties such as the onset of a spin-density-wave instability. (22 refs.)

102287 Dispersion of magnetoplasmons in layered systems. S.Das Sarma (Dept. of Phys. & Astron., Univ. of Maryland, College Park, MD, USA).
Phys. Rev. B (USA), vol.28, no.4, p.2240-3 (15 Aug. 1983).
Dispersion relations for magnetoplasmons are derived for both type-I and type-II superlattice systems within the simple model in which thickness of individual charged layers is neglected. The magnetic field is taken to be in the direction of the superlattice growth, and coupling to LO phonons is retained in the theory. General equations valid within the random-phase approximation are derived, and analytic results correct up to second order in two-dimensional wave number are obtained for the magnetoplasmon dispersion. (14 refs.)

102288 Exchange and correlation potentials in the one-electron equation. H.Suehiro, K.Awa, H.Yasuhara (Dept. of Phys., Hokkaido Univ., Sapporo, Japan).
Solid State Commun. (USA), vol.47, no.8, p.641-4 (Aug. 1983).
The self-energy operator of an electron liquid is examined by including the particle-hole and particle-particle ladder types of vertex corrections to the simplest approximation discussed by Hedin and Lundqvist (1969). It is found that the real part of the self-energy correction $\Sigma(p, \epsilon_p)$ is much more independent of the wavenumber p than that in the simplest approximation because of the strong short-range correlations at metallic densities. The quasi-particle mass ratio m^*/m in the present approximation gives values smaller than 1 in the whole metallic density region. (18 refs.)

102289 Averaged local field intensities in composite films. Z.Kotler, A.Nitzan (Dept. of Chem., Tel Aviv Univ., Tel Aviv, Israel).
Surf. Sci. (Netherlands), vol.130, no.1, p.124-54 (July 1983).
The photophysical properties of molecules adsorbed in composite films (e.g. surface island films) depend on the local electromagnetic field within the film. The ratio between the average field intensity $\langle|E|^2\rangle$ in the film and the intensity $|E_I|^2$ associated with the incident field is a measure of the electromagnetic contribution to the surface influence on molecular photophysical phenomena. This ratio depends on the film composition and morphology on the dielectric properties of the pure components making the film and on the frequency, direction and polarization of the incident radiation. Calculations of this ratio as a function of these parameters for several models of composite films are presented. Image interactions and retardation effects as well as radiative damping and finite size contributions to the dielectric response of the films are taken into account. In addition, an estimate of the field inhomogeneity within the film is obtained by calculating also the ratio of $\langle|E|^2\rangle_{\mathrm{shell}}/|E_I|^2$ associated with the field in thin shells surrounding the dielectric particles which constitute the film. (27 refs.)

102290 Dielectric function of 'undoped' In_2O_3. I.Hamberg, C.G.Granqvist (Phys. Dept., Chalmers Univ. of Technol., Gothenburg, Sweden).
Thin Solid Films (Switzerland), vol.105, no.2, p.L83-6 (15 July 1983).
Presents a detailed determination of the complex dielectric function representative of 'undoped' In_2O_3 in the wavelength range 0.25 $\mu m<\lambda<40$ μm. The effects of the semiconductor band gap and of the lattice vibrations are studied. (15 refs.)

102291 About the conjugation of semiconductor thermal elements. K.Sh.Kakhramanov.
Izv. Akad. Nauk Az. SSR Ser. Fiz.-Tekh. & Mat. Nauk (USSR), no.4, p.70-5 (1982). In Russian.
It is shown that there exists a decrease of binding energy of the valency electrons in the interval of the eutectic system on the principle of conjugate semiconductor thermal elements at increased temperatures with the use of the eutectic equilibrium. (7 refs.)

102292 Single-ion and pair-interaction potentials near simple metal surfaces. R.N.Barnett, R.G.Barrera, C.L.Cleveland, U.Landman (School of Phys., Georgia Inst. of Technol., Atlanta, GA, USA).
Phys. Rev. B (USA), vol.28, no.4, p.1667-84 (15 Aug. 1983).
Presents a model for semi-infinite simple metals which does not require crystalline order or a single species, and thus is applicable to problems of defect energetics near the surface and random alloy surfaces as well as ideal metal surfaces. The formulation is based on the use of ionic pseudopotentials and linear-response theory. An expression for the total energy is obtained which depends explicitly on ionic species and position. This expression is decomposed into a density-dependent term and single-ion and ionic pair-interaction potential terms. The single-ion potentials oscillate about a constant bulk value, with the magnitude of the oscillation decreasing rapidly away from the surface. The interaction between pairs of ions near the surface is shown to be a noncentral force interaction which differs significantly from the central-force bulk pair potential. The effect of quantum interference in the response of the semi-infinite electron gas to the ions is seen in both the single-ion and the pair-interaction potentials. Results are presented for the simple metals sodium, potassium, and rubidium. (45 refs.)

102293 Multilayer lattice relaxation at metal surfaces: a total-energy minimization. R.N.Barnett, U.Landman, C.L.Cleveland (School of Phys., Georgia Inst. of Technol., Atlanta, GA, USA).
Phys. Rev. B (USA), vol.28, no.4, p.1685-95 (15 Aug. 1983).
Relaxation at simple metal surfaces is studied via minimization of the total energy of a semiinfinite crystal. The expression for the total energy depends explicitly on the ionic positions, and is based on the use of pseudopotential theory and linear response. Electron screening is treated selfconsistently including exchange and correlation effects. From a systematic investigation of the energetics underlying metal surface relaxation, for the low-index surfaces of BCC Na and FCC Al it is concluded that to achieve quantitative surface structural predictions requires the use of the full total-energy expression for the semi-infinite solid. Such an expression must maintain the three-dimensional nature of the system and account properly for the inhomogeneous surface electron density and the self-consistent response of the electron system to the ionic positions (screening). Multilayer relaxation is shown to be essential for quantitative structural predictions and the origins of the phenomena are discussed in detail demonstrating the relative effects of electrostatic terms and band-structure contributions. The results exhibit damped oscillatory multilayer relaxations (the relaxation being particularly pronounced for the open faces) with a period equal to the bulk layer stacking period and agree well with available structural determinations obtained via the analysis of experimental data. 71.50 LOCALIZED SINGLE-PARTICLE ELECTRONIC STATES

(exc. impurities; for localisation in disordered structures, see 71.55J)

102294 Configuration mixing in the groundstate of Ce. M.Schluter, C.M.Varma (Bell Labs., Murray Hill, NJ, USA).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.147-61 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
4f electrons at the beginning of the rare earth series are weakly bound yet highly localized. Their virtual excitations create core change fluctuations which strongly enhance excitonic effects. The dynamic interaction led to a new groundstate which may be viewed as a boundstate of a 4f electron and an f-exciton. The 4f-hole Green's function is also strongly modified and shows two poles instead of one pole in the one-electron picture. The photoemission experiments and the X-ray edge absorption experiments in cerium and its metallic compounds are explained in this model. The new groundstate also provides a basis for the understanding of the γ-α phase transition of cerium. (35 refs.)

102295 Is one-parameter scaling inconsistent? Note on Kumar's note. B.Schuh (Inst. fur Theoretische Phys., Univ. zu Koln, Koln, Germany).
J. Phys. C (GB), vol.16, no.21, p.L741-3 (30 July 1983).
For original paper see ibid., vol.16, p.L109 (1983). A recent claim that the one-parameter scaling theory of localisation contains an inherent inconsistency is refuted. (2 refs.)

102296 Is one-parameter scaling theory of localisation consistent? Comment on Schuh's comment. N.Kumar (Dept. of Phys., Indian Inst. of Sci., Bangalore, India).
J. Phys. C (GB), vol.16, no.21, p.L745-6 (30 July 1983).
For comment see ibid., vol.16, p.L741 (1983). It is maintained that the one-parameter scaling theory is inconsistent with the physics of Anderson localisation. (4 refs.)

102297 Core-level reflectance spectroscopy of black phosphorus single crystals. M.Taniguchi, M.Seki, S.Suga, A.Mikuni, H.Kanzaki (Synchrotron Radiation Lab., Univ. of Tokyo, Tokyo, Japan), Y.Akahama, S.Endo, S.Narita.
Phys. Rev. B (USA), vol.28, no.2, p.1165-7 (15 July 1983).
The 2*p* core reflectance spectra have shown strong anisotropy for $\vec{E}\|a$ and $\vec{E}\|c$. A remarkably sharp doublet structure observed at the 2*p* core threshold for $\vec{E}\|a$ (at 130.33 and 131.20 eV) is assigned to the spin-orbit partner of the 2*p* core excitons with finite binding energy. The difference between the spectra for $\vec{E}\|a$ and $\vec{E}\|c$ is explained on the basis of selection rules for transitions from the 2*p* core levels to particular symmetry points (Z_4^-,Σ_1, and Γ_4^-) of conduction bands. (16 refs.)

102298 π-electron delocalization in poly(*p*-phenylene), poly(*p*-phenylene sulfide), and poly(*p*-phenylene oxide). G.Crecelius (Inst. fur Festkorperforschung, KFA Julich, Julich, Germany), J.Fink, J.J.Ritsko, M.Stamm, H.-J.Freund, H.Gonska.
Phys. Rev. B (USA), vol.28, no.4, p.1802-8 (15 Aug. 1983).
As deduced from electron-energy-loss experiments, the π band in poly(*p*-phenylene) has a width comparable to that in graphite. The π-band width in poly-(*p*-phenylene sulfide) is considerably narrower, and in poly(*p*-phenylene oxide) the π electrons are localized in benzene-derived states. These results are in line with recent theoretical results. In addition, structure in the C $1s$-π^* absorption is shown to be due to chemical shifts of *C* atoms in different coordination. (24 refs.)

102299 Optical instabilities and localized electronic states in hydrogenated amorphous silicon. P.C.Taylor, W.D.Ohlsen (Univ. of Utah, Salt Lake City, UT, USA).
Sol. Cells (Switzerland), vol.9, no.1-2, p.113-18 (June-July 1983).
Optical excitation of hydrogenated amorphous silicon films at high light intensites (100 W cm^{-2} or more) yields an increase in the electron spin resonance (ESR) signal which is metastable at room temperature. Pulsed annealing experiments between 375 and 475K (about 100-200°C) indicate that this ESR signal follows an annealing curve which is similar to that for the optically induced photoluminescence band at 0.8-0.9 eV. The annealing is complete for temperatures above about 475K (200°C). (21 refs.)

71.55 IMPURITY AND DEFECT LEVELS

102300 Investigation of impurity levels in n-type indium selenide by means of Hall effect and deep level transient spectroscopy. A.Segura (Dept. de Electricidad y Magnetismo, Facultad de Ciencias Fisicas, Valencia, Spain), K.Wunstel, A.Chevy.
Appl. Phys. A (Germany), vol.A31, no.3, p.139-45 (July 1983).
Reports the results of Hall effect and deep-level-transient-spectroscopy measurements on *n*-type indium selenide samples cleaved from non-intentionally doped material and from chlorine, tin, gallium sulphide or oxygen doped ingots. Some unidentified shallow and deep levels are found. Impurity levels attributed to Cl (310 meV) and to Sn (44 and 120 meV) are also reported. Anomalous degeneracy of electrons at low temperature is discussed. (25 refs.)

102301 Deep levels subsisting in ion implanted silicon after various transient thermal annealing procedures. A.Mesli, J.C.Muller, P.Siffert (Centre de Recherches Nucleaires, Strasbourg, France).
Appl. Phys. A (Germany), vol.A31, no.3, p.147-52 (July 1983).
Deep-level transient spectroscopy has been used to investigate the defects remaining in the ion implanted *p-n* junctions in silicon after various pulsed annealing techniques, including ruby and YAG lasers as well as pulsed electron beams (PEBA). The nature and distribution of the various identified levels are discussed for each procedure as a function of various experimental parameters. (20 refs.)

102302 Comment on the model of the Mg centres in NaCl crystals. A.Watterich, R.Voszka (Res. Lab. for Crystal Phys., Hungarian Acad. Sci., Budapest, Hungary).
Czech. J. Phys. Sect. B (Czechoslovakia), vol.B33, no.7, p.826-30 (1983).
The structure models of the Mg_2 centre (substitutional Mg^+ ion associated with a vacancy pair) and the Mg_4 centre (Mg^0 atom situated in a vacancy pair) produced in NaCl:Mg crystal by X-irradiation and subsequent F- and thermal bleaching are discussed. The given models explain without any contradiction all the experimental observations. (11 refs.)

102303 Optical experiments on deep centers in semiconductors. H.G.Grimmeiss (AB RIFA, Stockholm, Sweden).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.317-27 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
Using chalcogenide doped silicon as an example, the author shows how Fourier spectroscopy applied to both diodes and bulk samples can increase the understanding of electronic properties of deep centers. Results have been obtained by Fourier absorption (ABS), Fourier photoconductivity (PC) and Fourier photo admittance spectroscopy (FPAS). (22 refs.)

102304 The effect of hydrostatic pressure on shallow and deep impurity states in semiconductors. S.Porowski, W.Trzeciakowski (High Pressure Res. Center, Polish Acad. of Sci., Warsaw, Poland).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.331-46 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
The influence of hydrostatic pressure on various contributions to the impurity potential is discussed. The pressure dependence of impurity states is described for the potentials containing the slowly-varying term, the short-range term, and both of these terms. The effect of pressure on the impurity-lattice coupling is discussed. All the above considerations are illustrated with appropriate experimental results. (27 refs.)

102305 Defect states in plastically deformed *p*-type silicon crystals investigated by the Hall effect. H.Ono, K.Sumino (Res. Inst. for Iron, Steel & Other Metals, Tohoku Univ., Sendai, Japan).
J. Appl. Phys. (USA), vol.54, no.8, p.4426-32 (Aug. 1983).
Measurements of Hall effect and DC conductivity have been conducted on plastically deformed *p*-type floating-zone-grown silicon crystals to investigate the energy levels of defects introduced by deformation. The temperature dependence of the carrier concentration is analyzed on the basis of the model in which electrically active centers induced by deformation are assumed to be distributed discretely in the crystal. It is shown that both acceptors and donors having deep energy levels are introduced simultaneously by deformation, the concentrations of which are proportional to the dislocation density. The concentration of the deformation-induced acceptors is found to be 6-7 times as high as that of the deformation-induced donors. The energy levels of these acceptors and donors are approximately at the same position, namely 0.3-0.4 eV above the top of the valence band. (14 refs.)

102306 Defect and impurity states in silicon nitride. J.Robertson (Dept. of Phys., Univ. of Illinois, Urbana, IL, USA).
J. Appl. Phys. (USA), vol.54, no.8, p.4490-3 (Aug. 1983).
The electronic levels associated with silicon and nitrogen dangling bonds and Si-H, N-H, and Si-Si units within bulk Si_3N_4 have been calculated using the tight-binding and recursion methods. The Si dangling bond, the Si-H σ state and the Si-Si σ state all lie in the gap. The Si-Si σ state lies in midgap and could be a long-term hole trap. The Si dangling bond state lies just below the conduction band and could act as a very efficient electron trap. (29 refs.)

102307 The F^+ centre in lithium oxide. C.K.Ong (Dept. of Phys., Nat. Univ. of Singapore, Lower Kent Ridge, Singapore).
J. Phys. C (GB), vol.16, no.21, p.4081-5 (30 July 1983).
The author has calculated the absorption energy for the F^+ centre in lithium oxide by using the point-ion model as well as the approximate pseudopotential method formulated by Bartram and co-workers (1968). The result obtained using the point-ion model agrees reasonably well with that from experimental work. However, the result obtained using the approximate pseudopotential calculation is higher than the experimental result by 1 eV. (18 refs.)

102308 A novel perturbative-variational approach and its application to the impurity states in anisotropic crystals—A comment. K.Navaneethakrishnan (School of Phys., Madurai Kamaraj Univ., Madurai, India).
J. Phys. C (GB), vol.16, no.23, p.L843-4 (20 Aug. 1983).
It is pointed out that the approach of Lee et al. (see ibid., vol.15, p.L469, 1982) for the computation of the ground state energies of shallow donors in Si and Ge is similar to a spherical band approximation in the light of an earlier work by Tefft (see Bull. Am. Phys. Soc., vol.13, p.710, 1968). (3 refs.)

102309 Observation of spin-dependent thermal emission from deep levels of semiconductors. M.C.Chen, D.V.Lang (Bell Labs., Murray Hill, NJ, USA).
Phys. Rev. Lett. (USA), vol.51, no.5, p.427-9 (1 Aug. 1983).
The first observation of spin-dependent thermal emission from a deep gap state in a semiconductor is reported. As a result the silicon dangling-bond defects at the Si/SiO_2 interface can be directly correlated with a 0.36-eV-deep hole trap. (10 refs.)

102310 DLTS investigation of electron traps in As-grown and Cd-fired CdS. D.Verity, D.Shaw, F.J.Bryant, C.G.Scott (Dept. of Phys., Univ. of Hull, Hull, England).
Phys. Status Solidi a (Germany), vol.78, no.1, p.267-75 (16 July 1983).
Deep level transient spectroscopy is used to investigate electron traps in as-grown n-CdS and in CdS annealed in Cd vapour or in liquid Cd. Nine electron traps are detected with activation energies in the range $\approx$0.19 to 0.92 eV. Two traps with mean activation energies of 0.19 eV (E_1) and 0.46 eV (E_2) are present in all samples regardless of source or annealing treatment and have also been reported by other workers. Because of their large electron capture cross-sections ($>10^{-14}$ cm^2) and the linear relation between their concentrations and the free electron concentration, E_1 and E_2 are believed to be donor-like associates formed between residual impurities and native defects. (31 refs.)

102311 Deformation-induced point defects in germanium. F.H.Baumann, W.Schroter (IV. Phys. Inst., Univ. Gottingen, Gottingen, Germany).
Philos. Mag. B (GB), vol.48, no.1, p.55-61 (July 1983).
Using a transient capacitive method (deep-level transient spectroscopy), the authors have studied defects introduced into n-type germanium by plastic deformation at temperatures below 0.6 T_m (where T_m is the melting temperature). From the annealing behaviour of a defect with a level at E_c-0.29 eV, they conclude that point-defect clouds surround the dislocation formed during plastic deformation, and that these anneal out at high temperatures. (7 refs.)

102312 Real-space rescaling method for disordered systems. B.W.Southern, A.A.Kumar, J.A.Ashraff (Dept. of Phys., Univ. of Manitoba, Winnipeg, Manitoba, Canada).
Phys. Rev. B (USA), vol.28, no.4, p.1785-91 (15 Aug. 1983).
An exact real-space rescaling approach for disordered tight-binding model Hamiltonians is presented. The method provides a direct way of obtaining the local Green's functions and the local density of states. The behavior of the eigenstates in a given region of energy can be determined from the behavior of the rescaling transformation under iteration. Localized-mode behavior is characterized by a fixed point of the transformation and the inverse localization length can be obtained directly from an analysis of the approach to this fixed point. The problem of a single impurity is studied in detail and the method is compared with the standard treatment of such problems. (12 refs.)

102313 Evidence for shallow bound states in PbTe. A.V.Lewis (Clarendon Lab., Univ. of Oxford, Oxford, England), F.Kuchar, R.J.Nicholas, J.C.Ramage, L.Palmetshofer.
Phys. Rev. B (USA), vol.28, no.4, p.2244-8 (15 Aug. 1983).
For original paper see ibid., vol.21, p.3447 (1980). Data are presented showing structure in the magneto-optical absorption of thin films of *p*-type PbTe, which cannot be explained in terms of free-carrier effects alone. This structure, while having a similar form in many samples, is quantitatively different in samples with different doping. This behavior is strongly suggestive of central cell effects on bound-impurity states rather than of intrinsic many-body effects as recently suggested by McKnight and Drew (1980). (21 refs.)

102314 Evidence for shallow bound states in PbTe: A reply. S.W.McKnight (Dept. of Phys., Northeastern Univ., Boston, MA, USA), H.D.Drew.
Phys. Rev. B (USA), vol.28, no.4, p.2249-51 (15 Aug. 1983).
For original paper see ibid., vol.21, p.3447 (1980); for comment see ibid., vol.28, p.2244 (1983). Line-shape calculations cast doubt on the interpretation offered by Lewis et al. (the preceding comment). (15 refs.)

102315 Shallow donors in CdF_2 crystals and the semiconductor-insulator transition in mixed $Cd_{x-1}Me_xF_2$ fluorites. J.E.Dmochowski, I.Kosacki, J.M.Langer (Inst. of Phys., Polish Acad. of Sci., Warsaw, Poland).
Radiat. Eff. (GB), vol.72, no.1-4, p.139-44 (1983). (Proceedings of the Fourth Europhysical Topical Conference on 'Lattice Defects in Ionic Crystals', Dublin, Ireland, 29 Aug.-3 Sept. 1982).
The predicted, but as yet unobserved, intradonor absorption spectrum of the hydrogenic-like donors in CdF_2 crystals is presented. The role of phonon coupling in these spectra is discussed. From the data on the insulator-semiconductor transition in $CdPbF_2$ it is concluded that the dominant factor in convertibility of CdF_2 to a semiconducting state is its electron affinity, the largest among the fluorites ($\chi\approx$4 eV). (16 refs.)

102316 Electronic states associated with extended defects in quantum well structures. C.E.T.Goncalves Da Silva (Inst. de Fisica Gleb Wataghin, Univ. Estadual de Campinas, Campinas, Brazil), P.Fulco.
Rev. Bras. Fis. (Brazil), vol.12, no.2, p.325-36 (June 1982).
A simple model for the calculation of bound states associated with extended defects in quantum well structures is developed. The authors consider a particle confined between two plane parallel potential walls and determine the conditions for existence of bound states for two types of defects: infinite 'trench-like' and cylindrical. In a Ga(Al,As)-GaAs-Ga(Al,As) quantum well structure defects capable of producing appreciably bound states must have lateral dimensions of the order of 0.1 μm. (7 refs.)

71.55J Localization in disordered structures

102317 Disorder and interaction. C.Castellani (Istituto di Fisica, Univ. dell'Aquila, L'Aquila, Italy), C.Di Castro, G.Forgacs, E.Tabet.
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.55-60 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
In trying to describe from a theoretical point of view the combined effect of the interaction and the disorder, the main difficulty of the problem lies in the absence of a simple description in terms of an effective Hamiltonian, as a preliminary step to build up a standard renormalization procedure. By imposing general gauge invariance requirements, the authors have shown that the localization transition of a free fermion gas in the presence of impurities can be adequately described in $2+\epsilon$ dimensions within the framework of the usual many-body theory. In this way the linear response theory to an external electromagnetic field was directly renormalised. (10 refs.)

102318 A method for calculating the localisation length, with an analysis of the Lloyd model. R.Johnston, H.Kunz (Ecole Polytech. Federale de Lausanne, Lausanne, Switzerland).
J. Phys. C (GB), vol.16, no.23, p.4565-80 (20 Aug. 1983).
A method is developed to calculate the localisation length in disordered systems. It can be considered to be a generalisation of the method of Herbert, Jones and Thouless (1971-2) for one-dimensional systems, to wires and ν-dimensional lattices. The localisation length can be calculated under some assumptions when the disorder has a Lorentzian probability distribution. No localisation transition is found, that is the localisation length is finite for arbitrarily small non-zero values of the disorder. For other distributions a perturbation expansion is developed, which is valid for large values of disorder and small energies. The dominant term and the first-order correction are calculated. (12 refs.)

102319 Eigenfunction in disordered systems near the mobility edge. A.Brezini (Internat. Center for Theoretical Phys., Trieste, Italy).
J. Phys. C (GB), vol.16, no.24, p.4839-47 (30 Aug. 1983).
A model is proposed to calculate the average probability and the average size of the localisation domain for an electron being localised at a given site in a Cayley tree lattice. The numerical results are presented in the limit of weak disorder in the case of the Cauchy distribution for site energies. Attention is paid to the states near the mobility edge in the localised regime. In parti-

cular, features exhibited in the linear-chain case are observed for the first time for higher dimensions. (18 refs.)

102320 ESR study of effects of pressure treatment, temperature and annealing on the structure of the impurity Cr^{3+} centers in chalcogenide glasses. E.A.Zhilinskaya, V.A.Shanditsev, I.V.Chepeleva, V.N.Lazukin (Inst. of Nuclear Phys., Moscow State Univ., Moscow, USSR).
J. Non-Cryst. Solids (Netherlands), vol.57, no.1, p.71-80 (Aug. 1983).
The effects of pressure treatment up to 77 kbar of temperature and of annealing on the structure of the impurity Cr^{3+} centres in glasses As_2Se_3 (I), 5Cu $95As_2Se_3$ (II) and $TlAsS_2$ (III) was studied by the EPR method. The high pressure treatment of (I) and (II) leads to considerable changes by the EPR parameters and their temperature dependences due to the increase of the zero field splittings of the Cr^{3+} energy levels, connected with nonreversible local structure changes in glasses. (16 refs.)

102321 Defect states in amorphous germanium. N.Ishii (Dept of Electrical Engng. & Electronic Engng., Fukui Inst. of Technol., Fukui, Japan), M.Kumeda, T.Shimizu.
Phys. Status Solidi b (Germany), vol.118, no.1, p.K65-8 (1 July 1983).
To examine whether the defects in a-Ge:H are similar ones to those in a-Si:H or not, the calculations for a-Ge were carried out by using the method of Haussman (1966) and Eilebrecht et al. (1976). The interatomic distances for Ge clusters used for the calculation are 2.45/2.35 times as long as those for the corresponding Si clusters. As the parameters of the extended Huckel theory for Ge, the authors have used those which were determined so as to reproduce the band structure of crystalline Ge. (8 refs.)

102322 Connection of localization with the problem of the bound state in a potential well. E.N.Economou, C.M.Soukoulis (Corp. Res. Sci. Lab., Exxon Res. & Engng. Co., Linden, NJ, USA).
Phys. Rev. B (USA), vol.28, no.2, p.1093-4 (15 July 1983).
It is shown that the problem of electron localization in a random potential is formally equivalent to the problem of finding a bound state in a shallow potential well. (8 refs.)

102323 Self-consistent calculation of the quasiparticle lifetime in two-dimensional disordered metals. J.M.B.Lopes dos Santos (Blackett Lab., Imperial Coll. of Sci. & Technol., London, England).
Phys. Rev. B (USA), vol.28, no.2, p.1189-92 (15 July 1983).
A self-consistent calculation of the quasiparticle inverse lifetime in two-dimensional disordered metals is presented in this paper. The author confirms the $T \ln (T_2/T)$ temperature dependence found by Abrahams, Anderson, Lee, and Ramakrishnan (1981) but finds a different prefactor and temperature T_2. In particular, the quasiparticle lifetime is not the same as the weak localization cutoff recently calculated by Fukuyama and Abrahams although it is quite simply related to it. (5 refs.)

102324 Electrons in coupled stereo-irregular chains. S.Stafstrom, R.Riklund, K.A.Chao (Dept. of Phys. & Measurement Technol., Univ. of Linkoping, Linkoping, Sweden).
Phys. Rev. B (USA), vol.28, no.4, p.2199-211 (15 Aug. 1983).
Two interacting stereo-irregular chains of hydrogen atoms coupled at a finite number of bridge points are simulated by a computer and are solved numerically via the unrestricted Hartree-Fock approximation with a modified spin-polarized potential. The electron localization is studied with the inverse participation ratio and the moment analysis. The authors discovered that the eigenstates in the lower part of the spectrum are localized around the bridge points due to the random ionic potential. The resultant random potential is screened by the electrons occupying the intermediate region of the spectrum. Thus electrons near the Fermi energy feel a smooth potential and can tunnel through the bridge points. Connection between the present calculation and conducting polymers is discussed. (45 refs.)

102326 Electron transfer between magnetic ions in mixed valence binuclear systems. J.-J.Girerd (Lab. de Spectrochemie des Elements de Transition, Univ. de Paris-Sud, Orsay, France).
J. Chem. Phys. (USA), vol.79, no.4, p.1766-75 (15 Aug. 1983).
Describes how the Hubbard model in the atomic limit implemented by taking into account molecular vibrations can give a description of mixed valence binuclear systems with both metallic ions simultaneously magnetic. A Fe^{III} (high spin) binuclear complex would constitute an example. In such systems electron transfer and electron exchange are expected. If the compound belongs to class II (Robin and Day classification) the author finds that the activation energy of the thermal electron transfer and the intensity of the intervalence band are spin dependent but that the energies of spin states are given by the Heisenberg Hamiltonian with a new expression for the exchange parameter. For class III binuclear complexes a quite different behavior is found. The energy of the intervalence band is spin dependent but energies of spin states are no longer given by the Heisenberg Hamiltonian. (38 refs.)

102327 Theoretical calculations of lanthanide 4f⇌4f intensities: three non-degenerate wave processes. O.L.Malta (Dept. de Quimica, Cidade Univ., Recife, Brazil), A.A.S.Da Gamma, S.Canuto.
Rev. Bras. Fis. (Brazil), vol.12, no.4, p.563-83 (Dec. 1982).
By defining a single average energy denominator, ΔE_{AV}, it is shown that a formula for crystal-field induced electric-dipole $4^f \rightleftharpoons 4f$ intensities can be obtained which contains contributions of all possible excited configurations of interest and depends on radial integrals involving only 4*f* wavefunctions. Interference effects between the pseudomultipolar field (the mechanism originally proposed by Jorgensen and Judd (1964) to account for the high sensitivity of certain $4f \rightleftharpoons 4f$ transitions to changes in the chemical environment) and electric dipole mechanisms are also considered. The theory is then applied to the systems $Y_2O_3:Nd^{3+}$ and $LaF_3:Nd^{3+}$. It is concluded that a reliable value for the average energy denominator, ΔE_{AV}, is given by the first opposite parity excited configuration ($4f^{N-1}5d$) and that 'core excitations' as well as interference effects give very important contributions. 71.70C Crystal and ligand fields

102328 Effects of screening on crystal-field magnetoelastic coupling in rare-earth intermetallic compounds. A.del Moral (Dept. de Electricidad y Electronica, Univ. de Zaragoza, Zaragoza, Spain).
J. Phys. C (GB), vol.16, no.23, p.4637-53 (20 Aug. 1983).
The effect of screening by conduction electrons on the magnetoelastic coupling due to the crystal field in the Laves-phase rare-earth (RE) intermetallics is calculated and applied to $REAl_2$ compounds. The Thomas-Fermi and Hartree approximations for the screening are considered. Tetragonal, orthorhombic and rhombohedral strains are considered through the distortion of the lattice and of the screening and ligand-ion charge densities. The effect of the screening on magnetoelastic parameters is substantial. The introduction of conduction band exchange is able to modify the sign of the tetragonal parameter compared with the bare-ion point-charge model. The Friedel oscillations of the crystal potential modify the sign of the rhombohedral mode as well. A comparison with available magnetoelastic data for the compounds $NdAl_2$, $PrAl_2$ and $TbAl_2$ is presented and good agreement with calculations is obtained if conduction electron band exchange is envisaged. (32 refs.)

102329 $E\otimes\epsilon$-type Jahn-Teller effect of ReO_4^{2-} in KBr crystals: an EPR study. H.Bill, Y.R.Sekhar (Groupe de Phys., Chimie du Solide, Univ. de Geneve, Geneva, Switzerland).
J. Phys. C (GB), vol.16, no.24, p.L889-94 (30 Aug. 1983).
EPR experiments have been carried out on irradiated KBr crystals doped with ReO_4^- ions at 4.2K. They indicate the formation of ReO_4^{2-} ($5d^1$, ^2E ground state) subjected to an $E\otimes\epsilon$-type Jahn-Teller distortion. Uniaxial stress experiment show that the ReO_4^{2-} ion reorientates locally and the spin Hamiltonian parameters are unaltered by the application of the stress. A quadratic stress coupling term cannot be neglected. A model based on the approach of M.C.M. O'Brien is proposed to explain the experimental results. (13 refs.)

102330 Quasistatic long-range correlations on Jahn-Teller centers via the phonon field in K_2ZnF_4:Cu^{2+} at low temperatures. M.V.Eremin, T.A.Ivanova, Yu.V.Yablokov, R.M.Gumerov (Physicotech. Inst., Acad. of Sci., Kazan, USSR).
JETP Lett. (USA), vol.37, no.5, p.268-70 (5 March 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.5, p.226-8 (5 March 1983).
Correlations are discovered between distortions of Jahn-Teller Cu^{2+} centers in a K_2ZnF_4 crystal at distances exceeding the range of indirect-exchange interactions. (4 refs.)

102331 Vibronic intensities in the electronic spectra of transition metal ions. I. Crystal field calculations for the $^2E_g \rightleftharpoons {}^4A_{2g}$ transitions of Cs_2MnF_6. R.Acevedo (Dept. of Chem. Engng., Univ. of Chile, Santiago, Chile), C.D.Flint.
Mol. Phys. (GB), vol.49, no.5, p.1065-76 (10 Aug. 1983).
The relative vibronic intensities of the vibronic origins due to the three odd parity vibrational modes have been calculated for the $^2E_g \rightleftharpoons {}^4A_{2g}$ transition of the octahedral MnF_6^{2-} ion, using a crystal field model. Two methods for treating the sum over the intermediate odd parity states are considered, the closure approximation and the single $^4T_d{}^2{}_u2p$ state method. It is shown that in the latter limit the relative vibronic intensities depend only on the vibrational force field whereas using closure there is also some dependence on the radial functions employed. Calculations using six different force fields and several radial functions are presented several of which reproduce the experimental relative intensity for both methods, although there is a strong dependence of the calculated intensity on the force field. (37 refs.)

102332 Hyperfine fields of ^{11}B in ferromagnetic $R_ERh_4B_4$ (R_E=Gd,Tb,Dy,Ho). T.Kohara, Y.Kohori, K.Kumagai, K.Asayama (Coll. of Liberal Arts, Kobe Univ., Kobe, Japan).
Phys. Lett. A (Netherlands), vol.96A, no.8, p.425-7 (25 July 1983).
Hyperfine fields of ^{11}B in ferromagnetically ordered Gd-, Tb-, Dy- and $HoRb_4B_4$ have been measured by an NMR in zero-field experiment. The hyperfine fields are explained as a sum of the dipolar field from the surrounding R_E ion, the conduction electron polarization via s-f exchange interaction and the Lorentz field. A preliminary experiment in (Ho-Er)Rh_4B_4 has also been made. (9 refs.)

71.70E Spin-orbit coupling, Zeeman, Stark and strain splitting

102333 Magnetic properties of metallic clusters. W.D.Knight (Dept. of Phys., Univ. of California, Berkeley, CA, USA).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.521-8 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
The molecular beam deflection profile for sodium trimers Na_3 shows the familiar one Bohr magneton peaks astride a central peak of comparable intensity on the beam axis. The magnetism is attributed to the odd electron spin. Spin rotation and hyperfine interactions produce avoided crossings in the Zeeman diagram. Diabatic transitions occur at the avoided crossings if the beam traverses a region of rapidly changing transverse magnetic field. Results are given for Li_3, Na_3, and K_3, plus a number of mixed alkali trimers and larger sodium polymers. (16 refs.)

102334 Impurity-ligand effects on the magneto-optically measured spin-orbit splitting of trapped electron centres. D.Y.Smith (Solid State Sci. Div., Argonne Nat. Lab., Argonne, IL, USA), H.J.Paus, M.Rapp, W.Wenzel.
Radiat. Eff. (GB), vol.72, no.1-4, p.89-96 (1983). (Proceedings of the Fourth Europhysical Topical Conference on 'Lattice Defects in Ionic Crystals', Dublin, Ireland, 29 Aug.-3 Sept. 1982).
The spin-orbit interaction of F_A-type centres (F_A, Z_2^+) has been studied experimentally and theoretically. It is found to have a greater anisotropy than anticipated from early experiments on F_A(Na) centres. Nearest-neighbour impurities with sufficiently large spin-orbit interaction may dominate the effect to yield both negative and positive spin-orbit energies depending on the relative orientation of the centres and the measuring light beam. 102335 Electric field gradient of Ag in Zn. E.van Walle, D.Vandeplassche, C.Nuytten, J.Wouters, L.Vanneste (Dept. of Naturrkunde, Katholieke Univ. Leuven, Leuven, Belgium).
Phys. Rev. B (USA), vol.28, no.2, p.1109-12 (15 July 1983).
The electric quadrupole interaction of $^{110}Ag^m$ implanted in a zinc single crystal has been studied by means of low-temperature nuclear orientation. An electric-field-gradient value of $+1.71(11)\times10^{17}$ V/cm^2 is deduced. This measurement provides a first inclusion of a one-valent probe into the systematics. (21 refs.)

72.00 ELECTRONIC TRANSPORT IN CONDENSED MATTER

(for surfaces, interfaces, and thin films, see 73.)

72.10 THEORY OF ELECTRONIC TRANSPORT; SCATTERING MECHANISMS

102336 Incoherent excitation transport in energetically disordered media. R.Parson (Dept. of Chem., MIT, Cambridge, MA, USA).
Chem. Phys. Lett. (Netherlands), vol.99, no.3, p.213-16 (5 Aug. 1983).
The Gochanour, Andersen and Fayer treatment (1979) of excitation transport in spatially disordered systems is extended so as to incorporate energetic disorder. (9 refs.)

102337 The quantum Hall effect. II. S.M.Girvin (Surface Sci. Div., NBS, Washington, DC, USA), M.E.Cage.
Comments Solid State Phys. (GB), vol.11, no.2, p.47-58 (1983).
For pt.I see ibid., vol.11, p.1 (1983). The recent surprising observation of a quantization of the Hall resistance in units of h/e^2 in quasi-two-dimensional conductors has necessitated a major rethinking of the theoretical picture of transport in these systems. The central problem is understanding why ideal behavior persists even in the presence of strong disorder. (34 refs.)

102338 Localization and interaction in one dimension. W.Apel, T.M.Rice (Theoretische Phys., ETH, Zurich, Switzerland).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.35 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
Summary form only given. A new approach is given to the problem of an interacting impure one-dimensional electronic system. First the inelastic meas free path $l_{in}(T)$, which results from collisions with other electrons is calculated. The elastic mean free path $l_{el}(T)$ due to impurity scattering is obtained from the resistivity of an infinitesimal short sample. Following Thouless (1980), the authors argue that the impurity scattering is classical when $l_{in}(T) \ll l_{el}(T)$. From the temperature dependence of the mean free paths they conclude that for $2g_2\text{-}g_1 <= {}^3/_5 2\pi v_f$ and $g_1 > 0$ (excluding the Peierls transition) this condition is satisfied at sufficiently low temperature and as a result the resistance is proportional to the length of the sample. The value of the resistivity vanishes in the limit $T \to 0$ due to the complete screening of the impurity potential. In the other regime, $l_{in}(T) \gg l_{el}(T)$ and the impurity scattering must be treated quantum mechanically. The resistance diverges exponentially with a positive power (depending on the interaction) of the length. (3 refs.)

102339 Cluster coherent medium theory for transport on random lattices. G.Korzeniewski, D.F.Calef (Dept. of Chem., MIT, Cambridge, MA, USA).
J. Phys. C (GB), vol.16, no.23, p.4599-609 (20 Aug. 1983).
Coherent medium theory for a master equation description of transport on random lattices is extended to includes scattering in clusters larger than two sites (or one bond) exactly. Bond and site-averaged numerical calculations for the square lattice show some features of transport are improved by this method but that larger clusters are needed in order to obtain exact long-time properties. (14 refs.)

102340 Energy transfer processes in non-ohmic hopping conductivity in a strong electric field. A.A.Berezin (Dept. of Engng. Phys., McMaster Univ., Hamilton, Ontario, Canada).
Phys. Lett. A (Netherlands), vol.97A, no.3, p.105-7 (15 Aug. 1983).
Energy transfer processes between jumping current carriers in non-ohmic activationless $F^{-1/4}$-hopping conductivity in a strong electric field are considered. An energy gained during the downward spontaneous hopping of one electron can be radiationlessly transferred to another electron enabling it to make an upward energy hopping transition. It is shown that the contribution from these two-electron four-site energy transfer processes into the total hopping conductivity may be comparable or even exceed the contribution from one-electron radiative tunnel transitions. Numerical estimates are based on an example of beta-rhombohedral crystalline boron which exhibits $F^{-1/4}$-field law. (16 refs.)

102341 Evaluation of the effective-medium theory in a static conduction field. M.Nakamura (Dept. of Electronics, Tamagawa Univ., Tokyo, Japan).
Phys. Rev. B (USA), vol.28, no.4, p.2216-18 (15 Aug. 1983).
The effective-medium theory has been formulated by many authors under various methods. In this paper the author derives the theory for very conductive random media under a constant average current design, using a vector potential with respect to the current density. The author then shows that the theory is equivalently formulated by three requirements. The first two requirements, which have been used previously, are the requirements that the spatial averages of electric field and current density due to each sphere component embedded in the effective medium are equal to the effective or average field and current density. The third requirement is that the signal average of electric power equals the effective or average power. As a result it is recognized that the effective-medium theory has wide applicability and that it satisfies many requirements. (15 refs.)

72.15 ELECTRONIC CONDUCTION IN METALS AND ALLOYS

102342 Thermoelectric power of graphite intercalation compounds. K.Sugihara (Center for Materials Sci. & Engng., MIT, Cambridge, MA, USA).
Phys. Rev. B (USA), vol.28, no.4, p.2157-65 (15 Aug. 1983).
A model for the temperature variations of the thermoelectric power (TEP) of acceptor graphite intercalation compounds (GICs) is presented. At low temperatures, the TEP in GICs increases monotonically with T, then levels off above ~200K in striking contrast to that of pristine graphite. The diffusion contribution to the TEP is proportional to T and its magnitude is small as compared with that of the observed data. This observed behavior is attributed to the phonon drag effect. In the temperature region where the TEP is weakly temperature dependent, phonon relaxation is mainly controlled by the Rayleigh scattering due to point defect. The resultant TEP, which is composed of the phonon drag and diffusion terms, leads to a nearly T-independent value. Since the cross-sectional diameter of the Fermi surface in GICs is larger than that of pristine graphite, the relaxation rate of the Rayleigh scattering, which is given by $1/t_l(q)=fq^3$, becomes very large at high temperatures ($T>100$K). At low temperatures, where the boundary scattering plays a dominant role, the TEP is proportional to T^3. Detailed calculations are carried out by solving the phonon-carrier-coupled Boltzmann equation. (21 refs.)

72.15C Electrical and thermal conduction in amorphous and liquid metals and alloys

102343 *s-d*-band conductivity in liquid La. L.E.Ballentine, J.E.Hammerberg (Dept. of Phys., Simon Fraser Univ., Burnaby, BC, Canada).
Phys. Rev. B (USA), vol.28, no.2, p.1103-4 (15 July 1983).
The electrical conductivity of liquid La is computed numerically from a linear combination of atomic orbitals description of a cluster of 364 atoms. Contrary to an earlier suggestion that the conduction should be mainly due to *s* states, the authors find that the *d* states are dominant. Although the diffusivity of *s* states is about 2.5 times greater than that of *d* states, the density of *d* states is so much greater than the density of *s* states that the conduction is mainly by *d* states. (9 refs.)

102344 Thermal diffusivity and thermal conductivity of solid and liquid titanium. P.V.Gel'd, S.A.Il'inykh, S.G.Taluts, V.E.Zinov'ev (S.M. Kirov Ural Polytech. Inst., Sverdlovsk, USSR).
Sov. Phys.-Dokl. (USA), vol.27, no.11, p.948-9 (Nov. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.1-3, p.602-4 (Nov. 1982).
The thermal diffusivity was measured by the authors' variant of the method of plane temperature waves. A constant electron flux bombarding the plane of a thin metallic plate is modulated by an audiofrequency voltage, and the parameter measured is the delay in the phase of the temperature wave on the opposite face of the specimen, as recorded by a photodetector and a high-sensitivity phase meter. In the equipment used, the electron-beam power could be increased rapidly, permitting measurements to be carried out with high heating rates (up to $v=1000$K/sec). This allowed studies at temperatures unattainable by stationary methods, since with such a heating rate even in the liquid state the planar specimens underwent no marked change in shape. (8 refs.)

72.15E Electrical and thermal conduction in crystalline metals and alloys

102345 Thermal conductivity of niobium and molybdenum single crystals at low temperatures. A.Gladun, C.Gladun, H.Vinzelberg (Central Inst. of Solid State Phys. & Materials Res., Acad. of Sci., Dresden, Germany).
Acta Phys. Acad. Sci. Hung. (Hungary), vol.53, no.3-4, p.383-94 (1982). [received: Aug. 1983] (CRYOSEM '81. Second International Seminar on Low Temperature Physics, Visegrad, Hungary, 8-10 Oct. 1981).
The thermal conductivity of Nb and Mo single crystals was measured in the temperature range of 0.05-20K and 2-71K, respectively. (35 refs.)

102346 Thermal conductivity of amorphous iron alloys at low temperatures. G.Pompe, M.Gaafar, M.Falz, P.Buttner (Dept. of Low Temperature Phys., Tech. Univ. Dresden, Dresden, Germany).
Acta Phys. Acad. Sci. Hung. (Hungary), vol.53, no.3-4, p.401-9 (1982). [received: Aug. 1983] (CRYOSEM '81. Second International Seminar on Low Temperature Physics, Visegrad, Hungary, 8-10 Oct. 1981).
The thermal conductivity of ferromagnetic amorphous iron alloys ($Fe_{40}Ni_{40}P_{14}B_6$, $Fe_{80}B_{20}$, $Fe_5Co_{75}B_{20}$) was measured in the temperature range 2-100K. It was shown that there is a significant dependence of the phonon thermal conductivity on structure relaxation. (22 refs.)

102347 Anomalies of the electrical resistivity of Ni_3Fe alloys containing Nb, Ta and V. R.P.Vasil'eva, T.M.Panakhov, F.S.Guseinov (M.V. Lomonosov State Univ., Moscow, USSR).
Fiz. Met. & Metalloved. (USSR), vol.55, no.6, p.1209-11 (June 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
Nickel-iron Permalloys were alloyed with niobium, tantalum, and vanadium in amounts up to 12.5 at.%. The temperature dependences of the resistivity were determined for a variety of samples. The anomalies were interpreted in terms of the energy band structure and the changes in the resistivity with the composition were studied. (4 refs.) *A.T.*

102348 The low-temperature electrical resistivity of alloys with ferro-and antiferromagnetic interaction. N.I.Kourov, Yu.N.Tsiovkin, N.V.Volkenshtein.
Fiz. Nizk. Temp. (USSR), vol.9, no.7, p.731-6 (July 1983). In Russian. English translation in: *Sov. J. Low Temp. Phys. (USA)*
The electrical resistivity of $(Pd_xPt_{1-x})_3$ Fe and $Pt_3Mn_xFe_{1-x}$ alloys in the range of the concentration phase transition from antiferromagnetic state ($x=0$) to ferromagnetic one ($x=1$) is investigated. It is shown that along with the phonon contribution, the temperature dependent part of ρ has the contributions which are proportional to T^2 and $T^{1/2}$. The last contribution is associated with the interference of electron-electron interaction and elastic electron scattering due to the static inhomogeneities. The influence of the ferro-antiferromagnetic transition on the concentration dependence of the residual resistivity is discussed. (17 refs.)

102349 Temperature dependence of excess carrier density and thermopower in tin-doped bismuth. Pseudo-parabolic model. J.Heremans (Lab. PCES, Univ. Catholique de Louvain, Louvain-la-Neuve, Belgium), O.P.Hansen.
J. Phys. C (GB), vol.16, no.23, p.4623-36 (20 Aug. 1983).
Measurements of the Hall effect and magnetoresistance of four tin-doped bismuth samples in the temperature range 4.2-300K and in magnetic fields up to 6 T have been made. The resistivity data are converted to conductivities. These are reported and used to evaluate the temperature dependence of the excess carrier density and of the thermopower. The evaluation is performed with the Fermi energy as the only adjustable parameter within the pseudo-parabolic model which the authors have previously introduced. The excess carrier density is found to decrease with temperature, and this feature is used to analyse the data in terms of an acceptor energy level. A relation valid for all samples is found between this level and the Fermi level. For the thermopower agreement is found between the calculated values and the experimental ones reported in the literature. (25 refs.)

102350 The electrical resistivities of Li and Rb below 1K. Z.-Z.Yu, M.Haerle, J.W.Zwart, J.Bass, W.P.Pratt,Jr., P.A.Schroeder (Dept. of Phys., Michigan State Univ., East Lansing, MI, USA).
Phys. Lett. A (Netherlands), vol.97A, no.1-2, p.61-4 (8 Aug. 1983).
Measurements of the temperature dependence of the electrical resistivity of Li and Rb below 1K reveal strong deviations from the simple T^2 variation expected for electron-electron scattering. The source of these deviations is not yet known, but they may be associated with low energy excitations of defects such as dislocations. (22 refs.)

102351 Deviations of Matthiessen's rule in some PdAu alloys. J.Ray, G.Chandra (Tata Inst. of Fundamental Res., Bombay, India).
Phys. Lett. A (Netherlands), vol.97A, no.3, p.108-10 (15 Aug. 1983).
The low temperature electrical resistivity of $Pd_{1-c}Au_c$ alloys (c=0.1, 0.22, 0.38, 0.69, 0.82 and 1.1 at.%) have been studied in detail between 1.5 and 300K. Deviations from Matthiessen's rule (DMR) have been analysed on the basis of a two-band model, and the agreement is found to be reasonably good. The parameter γ was found to decrease monotonically with temperature, and no anomalous maximum was observed as with earlier studies of PdTi. The variation of β shows a weak temperature dependence. The limitations of the model are also discussed. (9 refs.)

102352 Electrical properties of the metastable $Mn_{1.11}Al_{0.89}$ alloy. B.Babic, M.Stojic, J.Konstantinovic ('Boris Kidric' Inst. of Nuclear Sci., Vinca, Belgrade, Yugoslavia).
Phys. Status Solidi a (Germany), vol.78, no.1, p.K77-80 (16 July 1983).
Electrical resistivity and Hall effect measurements have been performed on the $Mn_{1.11}Al_{0.89}$ alloy in order to get some information about the electronic properties, particularly free carrier concentration, which should be correlated with the magnetic and structural properties of the alloy. (5 refs.)

102353 Experimental investigation of the amplitudes of quantum oscillations in the transport coefficients of Al. R.Fleetcher (Dept. of Phys., Queen's Univ., Kingston, Ontario, Canada).
Phys. Rev. B (USA), vol.28, no.4, p.1721-6 (15 Aug. 1983).
The transverse resistivity (both thermal and electrical) and the thermopower of Al have been made at fields of up to 8 T in the liquid-helium temperature range. The results show that the oscillations are related by known factors to a precision of a few percent. The agreement between theory and experiment suggests that phonon drag plays no observable role in the thermoelectric oscillations. There is an unresolved problem of precisely how the many-body effects are incorporated in the theory, though this does not affect the conclusions of this investigation in any way. (14 refs.)

102354 Influence of impurities on the electrical resistivity of zirconium and its alloys (with Ag, Pt, Ti). B.N.Aleksandrov.
Russ. Metall. (GB), no.4, p.50-6 (1981). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.4, p.59-66 (1981). [received: June 1983]
Examines the value $\Delta\rho/C$ for carbon contents $C' \rightarrow O$, i.e. in strongly diluted alloys. The experimental values $\Delta\rho/C$ were determined for 21 impurity elements based primarily on published measurements of the electric resistivity at room temperature. The nature of the change in $\Delta\rho/C$ from the distribution of the interface impurity-transition metal was established for three numbers of the periodic table, and it is shown that the influence of the impurity on the ρ of zirconium increases with the increase in the number in the periodic table: $3 \rightarrow 4 \rightarrow 5$ with a maximum $\Delta\rho/C$ value obtained for Re, Mn and, evidently, Tc. The assumption is advanced that the curve of the dependence of $\Delta\rho/C$ on the order number in the periodic table of the impurity element reflects the valency change of these elements (transition metals). (23 refs.)

72.15G Galvanomagnetic and other magnetotransport effects

102355 Measurement of the magnetoresistance of indium and $Fe_{40}Ni_{40}B_{20}$, $Fe_{30}Ni_{40}Cr_{10}B_{20}$ alloys by pulse technique in high magnetic fields. P.Czarnecki, M.Surma (Inst. of Phys., A. Mickiewicz Univ., Poznan, Poland).
Acta Phys. Pol. A (Poland), vol.A64, no.1, p.31-8 (July 1983).
The method of magnetoresistance measurements of metals and metallic alloys in pulsed magnetic fields of high intensity is presented. The accuracy of the sample magnetoresistance $\Delta\rho/\rho_0$ result is of ±12% and ±5% for $\Delta\rho/\rho_0$ values of 10^{-3} and 10^{-1}, respectively. The magnetoresistance of indium and $Fe_{40}Ni_{40}B_{20}$, $Fe_{30}Ni_{40}Cr_{10}B_{20}$ amorphous alloys is analysed. (14 refs.)

102356 Magnetic field and strain dependences of the tin whiskers resistance. Yu.P.Gaidukov, N.P.Danilova, E.V.Nikiforenko.
Fiz. Nizk. Temp. (USSR), vol.9, no.7, p.722-30 (July 1983). In Russian. English translation in: *Sov. J. Low Temp. Phys. (USA)*
The influence of dimensions, magnetic field and simple extension on the resistance of white tin whiskers is studied. Elastic strain measurements were conducted at maximum relative elongations 2-4% in magnetic fields up to $H=55$ kOe at $T=4.2$K. Samples were oriented along [001] and (100) axes, the thickness of the samples varied between 0.8 and 4.3 μm. Size effects in the resistance and magnetoresistance of whiskers were observed. The main effect is the absence of high anisotropy of the magnetoresistance (which is typical for bulk samples) up to $Hd \approx 2$Oe. cm. The elastic twinning of the (001) samples was observed when extending to 4%. Experimental data on elastic strain up to 2% of the $\langle 100 \rangle$ samples do not testify to the existence of the $2^1/_2$ order transition. (24 refs.)

102357 Time of flight experiments with conduction electrons—an application of weak localization. G.Bergmann (IFF, KFA Julich, Julich, Germany).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.17-25 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
Magneto-resistance measurements on a thin disordered (two-dimensional) film correspond to a time of flight experiment with conduction electrons. It allows the determination of the inelastic lifetime, the spin-orbit coupling time and the magnetic scattering time of the conduction electrons. (22 refs.)

102358 Kinetic and electronic properties of $Ni_3(Fe_{1-x}Ta_x)$ and $Ni_3(Fe_{1-x}V_x)$ alloys. T.M.Panakhov, F.S.Guseinov, R.P.Vasil'eva.
Izv. Akad. Nauk Az. SSR Ser. Fiz.-Tekh. & Mat. Nauk (USSR), no.4, p.89-92 (1982). In Russian.
Concentration dependencies of abnormal Hall effect and electrical resistivity were studied in two systems of ternary alloys $Ni_3(FeV)$ and $Ni_3(FeTa)$. Abnormal Hall constant R_s-was established to have a linear dependence on p during alteration in Ta, V alloys. Packing $(s+d)$ degree of alloy bands was determined in terms of spin direction in charge carriers. Formation of superstructural transformations in $Ni_3(FeV)$ was shown to be associated with packing $(s+d)$ character of carrier bands. (12 refs.)

102359 Influence of composition on the electronic state of Ce in the intermetallic Ce-Fe-Si system. E.M.Levin, O.I.Bodak, Yu.V.Zhipa, M.M.Vashchishchuk.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.6, p.78-81 (1983). In Ukrainian.
Intermetallic CeFeSi and $CeFe_2Si_2$ are studied for differential thermo-emf structure and microstructure; initial components of $CeFe_2Si_2$ in synthesis were taken with the deviation from stoichiometric composition within 20-22 at.% Ce, 35-45 at.% Fe and 45-35 at.% Si. Electronic state of cerium, analyzed by the model of conduction electron resonance scattering in the case of $4f$-level splitting into sublevels under the effect of the crystalline field, depends on the fixed intermetallic composition and is not practically sensitive to deviations in the component content from the stoichiometric composition within the mentioned limits. 102360 Conducting polymers: solitons or not?. D.Baeriswyl (Seminar fur Theoretische Phys., ETH, Zurich, Switzerland).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.639-53 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
A review is given on the soliton model and its possible relevance for the interpretation of experiments in conducting polymers. It is argued that solitonic states, although being very attractive due to their simplicity and apparent ability to explain several experiments, are strongly distorted by various perturbations. Furthermore predictions based on the soliton model are often not specific enough to predict them using more conventional reasoning. (73 refs.)

102361 Effect of dopant on the physicochemical and electrical properties of organic conducting polymers. G.Tourillon, F.Garnier (Lab. de Photochimie Solaire, CNRS, Thiais, France).
J. Phys. Chem. (USA), vol.87, no.13, p.2289-92 (23 June 1983).
Electrochemically synthesized polythiophene and poly-substituted thiophene have been characterized by visible, IR, and XPS spectroscopy, and compared to polypyrrole. A high intrachain conductivity, increasing with the doping level, is demonstrated for the thiophene derivatives, which show a marked

metallic behavior. On the other hand, the relatively low macroscopic conductivity, measured on pressed pellets, is related to poor interchain contacts and to morphological inhomogeneities. (21 refs.)

102362 Pressure-temperature phase diagrams of several $(TMTTF)_2X$ compounds: stabilisation of a highly conducting metallic state under pressure in $(TMTTF)_2Br$. S.S.P.Parkin, F.Creuzet, D.Jerome (Lab. de Phys. des Solides, Univ.-Paris-Sud, Orsay, France), J.M.Fabre, K.Bechgaard.
J. Phys. (France), vol.44, no.8, p.975-84 (Aug. 1983).
Needle axis resistivity measurements on several TMTTF (tetramethyltetrathiafulvalene) salts of the form $(TMTTF)_2X$, with $X=Br$, ClO_4, PF_6, are presented for pressures up to 32 kbar. The pressure-temperature phase diagrams of all three materials are similar with the stabilization under pressure of a metallic state to low temperatures (~20K), below which there is a well defined metal-insulator transition. For $(TMTTF)_2Br$ and M-I transition is completely suppressed for pressures above some critical pressure $P_c \sim 25$ kbar and the compound is metallic to the lowest temperatures considered in this study, ~1K. Significant differences are found between samples grown from different chemical solvents: in one case the samples have resistance ratios exceeding 400 at 25 kbar with a conductivity greater than 10^6 $(\Omega cm)^{-1}$ at 4K, the highest values yet reported for any organic conductor. In the other case the samples show a possible superconducting transition near 3.5K at 25 kbar, but have smaller resistance ratios ($\lesssim 100$). For the latter samples at 25 kbar there is no saturation of the resistance in the low temperature regime, whereas for the former the resistance saturates below 10K. These results suggest slightly different critical pressures for these salts. P_c are much higher for the ClO_4 and PF_6 salts ($>$ 35 kbar). Magnetoresistance measurements have been made on samples of $(TMTTF)_2Br$ as a function of pressure, for field applied along the c^* axis. The magnetoresistance progressively increases with increasing pressure obtaining substantial values $((\rho(80\ kG)-\rho(H=0))/\rho(H=0) \sim 2\text{-}4)$ near P_c. These results establish that under pressure the physical properties of the $(TMTTF)_2X$ salts become increasingly to resemble those of their selenium counterparts, $(TMTSeF)_2X$. (20 refs.)

102363 The influence of electron-libron scattering on the transport properties of quasi-one-dimensional metals. W.Schiller, E.Chilla (Sektion Phys., Tech. Univ. Dresden, Dresden, Germany).
J. Phys. C (GB), vol.16, no.21, p.L747-53 (30 July 1983).
